This Licensee has now requested a license under a pending application, U. S. Serial No. 262,695, filed March 18, 1939, (recently allowed) and any patent that may issue therefrom, covering antimony treatment for chalk resistance of pigment. Licensee became informed of our application by reason of publication of limitation of a competitive patent, following settlement of interference with us.

We are proposing, therefore, to add this patent application, or any patent which may issue therefrom, to the original license, under exactly the same terms and conditions, except that for every pound of titanium pigment produced under this particular application herein mentioned, an increased royalty of one percent (1%) over and above the 2% ~~royalty in~~ the original agreement will be paid.

Beginning with October 1, 1940 Virginia Chemical Corporation is licensed to produce 6000 tons pure titanium

D. P. Exhibit 44

dioxide per year under our patents for the next six years. We estimate that about 15-20% of Licensee's production will come under this additional 1% royalty provision, and based on our present carload selling price, this would amount to a payment of about $2500-$3000 a year during this period, and thereafter at 9000 tons a year production, this would increase to about $3500-$4700 annually.

Patent and Legal Departments have approved this agreement, and propose that the transaction be handled by letter, as here attached, rather than by an additional and separate agreement.

It is, therefore, recommended that the Management of this Department be authorized to execute this additional license.

C. H. RUPPRECHT
GENERAL MANAGER

EXECUTIVE COMMITTEE

* * *

LICENSE TO VIRGINIA CHEMICAL CORPORATION UNDER U. S. PATENT APPLICATION, SERIAL NO. 262,695 RE CHALK-RESISTANT TITANIUM PIGMENTS:

WHEREAS, this Company entered into an agreement, dated August 5, 1937, with Virginia Chemical Corporation, by which, (a) du Pont granted them a non-exclusive license under 43 U. S. patents covering manufacture, use and sale of pure titanium dioxide on a royalty basis of 2% of du Pont average published carload selling price, with minimum royalty of ¼¢ per pound, and a rising scale of allowable tonnage to be made (not exceeding 9,000 tons a year after 1946), and (b) Virginia granted du Pont a non-exclusive, royalty-free license under one U. S. patent and one patent application re a calcium base titanium pigment;

RESOLVED, that C. H. Rupprecht, General Manager, or Zack Phelps, Assistant General Manager, Krebs Pigments Department, or the President or any Vice-President, of

D. P. Exhibit 45

this Company, together with the Secretary or an Assistant Secretary, be and they are hereby authorized to execute on behalf of the Company letter to Virginia Chemical Corporation agreeing to include in above-mentioned agreement, dated August 5, 1937, non-exclusive license under du Pont U. S. Patent Application, Serial No. 262,695, re antimony treatment for chalk resistance of titanium pigments, on the same terms mentioned in the main agreement except that royalty rate on production of this particular type of pigment shall be 3% of aforesaid selling price, said letter to be in form substantially as per copy submitted to this Committee by letter from the Committee on Patents, dated November 11, 1940.

This is to certify that the foregoing is a true and correct copy of resolution unanimously adopted by the EXECUTIVE COMMITTEE of E. I. du Pont de Nemours & Company at meeting held on Wednesday, November 13, 1940.

Newark, New Jersey

Dear Mr. Allegaert:

Referring to the desire of your Company to include the Booge Application, Serial No. 262,695, filed March 18, 1939 and entitled "Chalk-Resistant Titanium Pigments," or [redacted] patent or re-issue resulting therefrom, in the provisions of our license agreement of August 5, 1937, as amended, we wish to advise that we are willing to include it on the same terms and conditions as provided in the agreement, with the additional understanding that for every pound of titanium pigment produced under the said Booge application or patent, an increased royalty of one per cent (1%) over and above the contract royalty be paid.

If this is agreeable to you, kindly indicate by signing and returning the accompanying copy of this letter.

Very truly yours,

C. H. RUPPRECHT

Dear Mr. Rupprecht:

Thank you for your letter of November 18, granting us the right to operate under the Booge application serial No. 262,695, for the production of chalk-resistant titanium pigments.

The terms and conditions, as outlined in your communication, are acceptable and your request that one copy of your letter be signed and returned is being complied with. You will find the letter enclosed.

Thank you for your cooperation.

Yours very truly,

Dear Mr. Allegaert:

This will confirm our recent conversation relative to Article I, Paragraph (b) of our Agreement of August 5, 1937, under which Virginia Chemical Corporation is licensed to manufacture specific quantities of titanium dioxide under our patents, and also our letter of August 5, 1940 authorizing certain modifications.

In view of the conditions explained by you, we are agreeable to a further modification from our letter of August 5, 1940, to the extent of changing the quantity specified for the twelve-months period ending September 30, 1941 from 4,000 tons to 5,000 tons.

It is, of course, understood that our consent to this additional modification can not be regarded as a precedent for waiving any of the provisions of the contract.

D. P. Exhibit 48

Please indicate your acceptance of this further amendment of this contract by signing and returning the enclosed copy of this letter.

Very truly yours,

C. H. RUPPRECHT
General Manager.

Dear Mr. Allegaert:

This will confirm our conversation relative to Article I, paragraph (b), of our agreement of August 5, 1937 (as amended under dates of August 5, 1940 and May 12, 1941) under which Virginia Chemical Corporation is licensed to manufacture certain quantities of titanium dioxide under our patents.

This is to advise that we are agreeable to a further modification in the yearly quantity of titanium dioxide produced by you under our agreement, and we accordingly propose that Article I, paragraph (b), of our said agreement be amended to the extent that the quantity of titanium dioxide specified for each 12 months' period in said article and paragraph (as amended by said letters of August 5, 1940 and May 12, 1941) be modified whereby in lieu of such quantities henceforth you may produce not in excess of 9,000 tons per annum of titanium dioxide under said license.

It is understood, of course, that our consent to this additional modification does not otherwise alter our said

agreement, nor affect nor impair any of its remaining terms and provisions.

Please indicate your acceptance of this further amendment to said agreement by signing and returning to me the enclosed copy of this letter.

Very truly yours,

(s) Z. PHELPS

(120)

D. P. Exhibit 52

July 22, 1943

Mr. John Allegaert, President
Virginia Chemical Corporation
c/o United Color & Pigment Company
Newark, New Jersey

Dear Mr. Allegaert:

I am writing to confirm the understandings which we have reached in our recent discussions regarding the existing du Pont-Virginia Chemical Corporation agreement, dated August 5, 1937 (as variously amended under dates of August 5, 1940, May 12, 1941 and August 8, 1941), and the proposed further supplement to said agreement to include particularly licenses under United States patents and applications relating to rutile titanium oxide pigments which du Pont now owns.

It is agreeable to du Pont to include its United States rutile patents and applications under said agreement, which patents and applications are more particularly set forth in the attached schedule. Copies of the applications will be forwarded to you upon advice that the terms set forth herein are satisfactory to you.

We very much appreciate your offer that we include in this supplemental agreement the right of the Company to acquire non-exclusive, non-assignable licenses under your existing patents and applications relating to rutile titanium oxide pigments on terms satisfactory to this Company. However, we would prefer that the terms of such licenses as we may desire, be negotiated between us, as we have no

D. P. Exhibit 52

doubt that there would be no difficulty in arriving at mutually satisfactory terms.

Hence, du Pont now agrees to supplement said agreement of August 5, 1937, to the following extent:

(a) That the United States patents and applications including any patents resulting therefrom) which are set forth in the attached schedule shall be henceforth considered as included in Schedule "A", which accompanies said August 5, 1937 agreement, variously modified as aforesaid, and shall be considered as coming under the license therein granted to Virginia by du Pont;

(b) That upon expiration of the letters patent originally listed in said Schedule "A", the royalties which thereafter shall accrue to du Pont by reason of Virginia's titanium oxide pigment production shall be construed as applying only to titanium oxide pigments which Virginia shall manufacture, use or sell under the licensed patents and/or applications set forth in the attached schedule; and

(c) That du Pont shall be entitled, upon request, to acquire a non-exclusive, non-assignable license under the United States patents and applications (including any patents resulting therefrom) which you now own, relating to rutile titanium oxide pigments on terms that shall be mutually satisfactory.

It is understood that the above extension and modification of our said agreement, as amended, shall not be construed as otherwise altering, affecting or impairing any of the remaining terms and conditions thereof.

If the foregoing comprises a correct statement of the understanding which we have reached with respect to du

D. P. Exhibit 52

Pont's patents and applications and is satisfactory with respect to your patents and applications, will you kindly indicate your acceptance thereof by signing and returning to me the enclosed duplicate original of this letter, together with a list of your patents and copies of applications relating to rutile titanium oxide pigments.

Very truly yours,

E. I. DU PONT DE NEMOURS & COMPANY

FROM: PIGMENTS DEPARTMENT

MODIFICATION OF LICENSES TO AMERICAN CYANAMID COMPANY AND THE GLIDDEN COMPANY TO WAIVE PROVISION LIMITING PRODUCTION AND PROVISION OF PATENT SCOPE AND VALIDITY

Agreement dated August 5, 1937 between du Pont Company and Virginia Chemical Corporation (subsequently assigned to American Cyanamid Company) licensed VIRGINIA to manufacture, use and sell titanium dioxide under patents owned by DU PONT. This agreement includes the following Articles:

I.

(a) Du Pont hereby grants to Virginia a non-exclusive license to make titanium dioxide in the quantities specified in paragraph (b) of this Article, and to use and sell titanium dioxide so produced, throughout the United States of America and the territories and dependencies thereof, under the Letters Patent described in Schedule "A" hereof and any reissues or divisions thereof.

(b) The total quantity of titanium dioxide (including the titanium dioxide content of all compounds, mixtures and other products) made by Virginia wholly or partly under the claims of the patents licensed to it hereunder, shall not exceed in any annual period during the

continuance of this agreement the quantity specified for such year in the following table:

Annual Period	*Quantity*
October 1, 1937 to September 30, 1938	3,000 tons
" " 1938 " " " 1939	3,000 "
" " 1939 " " " 1940	3,000 "
" " 1940 " " " 1941	6,000 "
" " 1941 " " " 1942	6,000 "
" " 1942 " " " 1943	6,000 "
" " 1943 " " " 1944	6,000 "
" " 1944 " " " 1945	6,000 "
" " 1945 " " " 1946	6,000 "
Each subsequent annual period	9,000 "

V.

(a) Virginia admits the validity of each of the letters Patent listed in Schedule "A" hereof, and agrees that it will not directly or indirectly infringe or contest the validity or scope of any of the claims thereof, or aid or encourage others in so doing. The termination of this license for any cause prior to its normal expiration shall not affect the provisions of this Article or release or discharge Virginia from the admission and estoppel herein set forth.

(b) Du Pont admits the validity of United States Letters Patent No. 2,066,074 and of any Letters Patent issued on Application for United States Letters Patent Serial No. 138,104 (insofar as the Letters Patent so issued cover the invention or inventions claimed in said Application as submitted by Virginia to du Pont under date of July 7, 1937), and agrees that it will not di-

rectly or indirectly infringe or contest the validity or scope of any of the claims thereof, or aid or encourage others in so doing. The provisions of this paragraph (b) shall be effective so long as du Pont is licensed under said Letters Patent.

Article I, Section (b) was amended August 1, 1941 to afford maximum production by VIRGINIA of 9000 tons per annum.

Agreement dated January 1, 1935 between du Pont Company and American Zirconium Company (subsequently assigned to The Glidden Company) licensed AMERICAN ZIRCONIUM to manufacture, use and sell titanium dioxide under patents owned by DU PONT. This agreement includes the following Articles:

I.

(a) Krebs hereby grants to American a non-exclusive license to make titanium dioxide in the quantities specified in paragraph (b) of this Article, and to use and sell titanium dioxide so produced, throughout the United States of America and the territories and dependencies thereof, under the Letters Patent described in Schedule "A" hereof and any reissues or divisions thereof.

(b) The total quantity of titanium dioxide (including the titanium dioxide content of all compounds, mixtures and other products) made wholly or partly under the license granted herein, shall not exceed in any calendar year during the continuance of this agreement the quantity specified for such year in the following table:

D. P. Exhibit 53

Year	*Quantity*
1935	3,000 tons
1936	3,000 "
1937	3,000 "
1938	6,000 "
1939	6,000 "
1940	6,000 "
1941	6,000 "
1942	6,000 "
1943	6,000 "
Each subsequent year	9,000 ".

IV.

American admits the validity of each of the Letters Patent listed in Schedule "A" hereof, and agrees that it will not directly or indirectly infringe or contest the validity or scope of any of the claims thereof, or aid or encourage others in so doing. The termination of this license for any cause, prior to its normal expiration, shall not affect the provisions of this Article or release or discharge American from the admission and estoppal herein set forth.

Article I, Section (b) was amended August 1, 1941 to afford maximum production by American Zirconium of 9000 tons per annum.

The Legal Department recommends the elimination of Article I, Section (b), from each of these agreements. It also recommends elimination of Article IV from the American Zirconium Agreement and waiver of Article V of the Virginia Chemical Agreement only to the extent that its

covenants affect the scope, validity and infringement of the licensed du Pont patents. The Legal Department informs that the quantity restrictions of Article I, Section (b) of each agreement are of a nature which the Government has criticized, while the changes suggested in respect to Article IV of Zirconium Agreement and Article V of the Virginia Chemical Agreement are of a technical character designed to eliminate another possible ground of criticism against the licenses.

Attached hereto are proposed forms of letters to be transmitted to American Cyanamid and Glidden for purposes of effecting these changes in the agreements.

In view of the above, it is recommended that this Department be authorized to effect the changes proposed in the involved licenses, and to transmit the suggested letters to the respective licensees.

MEMORANDUM

Newport, Del.
February 26, 1936.

INFORMATION FROM MR. J. L. TURNER—2/25/36

Titanox-C

The calcium sulphate and wet blending equipment is completely installed at Sayerville,—finished in November. Has not been operated as yet.

Sayerville is now running at 40 tons TiO_2 per day. No straight TiO_2 made at St. Louis since April or May.

Further plans concerning blended Titanox-C are rather indefinite. The general feeling is that they will wet blend at Sayerville later on but this would mean making straight TiO_2 at St. Louis and using both of the TiO_2 capacity at Sayerville and St. Louis for Titanox-C.

Titanox-C at St. Louis being made by the old coalesced process. They are worried about quality compared with LO "Ti-Cal" particularly color. They do not see their way clear to switching over to a blending process at St. Louis for regular Titanox-C.

Concerning HO Titanox-C they made close to 1,000 tons in their trial runs. This of course was made by dry blending. I gather that much of the 1,000 tons is off-standard. This HO Titanoc-C is moving rather slowly and no further production is planned until the stock is decreased.

Titanox-B

This is still being made at St. Louis by the old coalesced process. They are talking rather seriously about changing

the process to blending but do not see their way clear to do this with the equipment available at St. Louis. I asked Mr. Turner why they seem to be considering "Ti-Bar" so seriously,—Mr. Kingsbury having recently gone over our "Ti-Bar" operation in detail followed now by Mr. Turner for an inspection of the plant. He replied that their Sales Department is quite concerned about the superior quality of "Ti-Bar", particularly color.

They have considered various blanc fixe processes including that developed by the Dorr Co., the salt fusion process, and a black ash-barium chloride process similar to our black ash residue process, the last one appearing most favorable to them. They are afraid of the Dorr process from the standpoint of equipment and operating costs and are afraid of the salt fusion process from the standpoint of controlling quality. The black ash process would be exactly similar to our black ash residue process except H_2S would be involved which they would burn and use in their sulphuric acid plant. They are, however, obtaining some credit from by-product sodium syiphide and I gather that they are not at all close to swinging over to a new process.

In general, Mr. Turner was a little vague concerning their plans which may have been due to reluctance to volunteer information or to the fact that many of their plans are reached by Mr. Roosevelt and Mr. Washburn together.

LEAD TITANATE

The present lead titanate process makes use of MO TiO_2 shipped from Sayerville. This is wet blended with litharge, ball milled, dried and calcined. The calcination has to be on a rather carefully controlled schedule to avoid poor color; two hours of 600°C then gradual increase to 650-700 and

D. P. Exhibit 58

possibly 750°. The calcination is complete when less than 1% of free PbO remains. (extractable with acetic acid).

The lead titanate is finely ground (not wet ground.). They have tried various dry grinding methods including the Raymond impact mill and another one. No one mill is a standard with them at present. This is evidently a serious problem. (We should plan to wet grind lead titanate if and when we produce it). In view of the rather sketchy information which Mr. Turner had on the lead titanate operation, he promised to send me a detailed description of the process.

Concerning the progress of lead titanate in the trade, Mr. Turner was rather indefinite. He first stated that they had no large customers and were selling only small sample lots. Later when I called his attention to Devoe & Raynolds he said that D. & R. actually adopted it.

The production schedule has been irregular, operating at times and shut down at times. His guess was an average of about three tons per day with warehouse stocks being brought up to a maximum.

In general, I got the impression that there was some withholding of information,—this being definitely the first time that this situation has developed.

MEMORANDUM

To: MR. ZACK PHELPS

Thru various visits of our representatives in Sayreville, we learn that T.P. is having great difficulty in washing their [illegible] sufficiently due to availability of only one washing Oliver. As a result, their Titanox-X pigments are relatively low in gloss and grit properties and this holds especially for their CR or 168 grades.

Under the circumstances, we should take full advantage of this deficiency in our Sales promotion arguments. Will it be in order for me to advise the Wilmington Sales Office of the general situation?

Our own comparisons consistently give a slight advantage to our CR-LO and Y-CR in grit and gloss properties, but Sales has not conducted any campaign along this line. This advantage is increased over T.P. production of the last two or three months which has been at high capacity.

Our attitude has been defensive for quite a while and much of our Sales effort has been spent in repulsing attacks at our good accounts. The present situation would

D. P. Exhibit 59

seem to present an opportunity to help the Sales Department out of this defensive position and allow them to make offensive claims at T.P.'s accounts.

It would not be my idea to pass on confidential information to the salesmen but merely explain the situation to the Wilmington Office so that they could spur the individual salesman to take the necessary aggressive action and make the necessary quality claims at T.P. accounts.

MR. ZACK PHELPS

I called Mr. J. L. Turner today to ask him about micronized Titanox-A LO grade. He first said that they had only made a trial run on this of 50 tons.

I then asked whether they had sold any and he said it had not been "released for sale." He then added that it was his understanding that it was not necessary to notify me on new micronized grades, and I took sharp issue with this. He went on to say that in our last Wilmington conference he understood that new micronized grades were not subject to notice. I told him in very definite terms that this was not my understanding and that it would change the whole spirit of the agreement.

He did not pursue the subject further but repeated that this micronized LO had not been "released for sale." I asked his definition of "release for sale" and it came down to a question of notifying their Sales Department that they had a new and improved pigment. I, of course, called his attention to the fact that "release for sale" had *previously* meant shipped or billed to a customer.

He then took another step backward and said that he did not think any of this had been shipped to customers. I told him that Dahlstrom had told Madson that all the LO

D. P. Exhibit 60

packed since October 25th had been micronized and shipped. Actually Dahlstrom told Madson that all LO shipped since October 25th had been the micronized grade. Turner was not clear as to whether some of this had been shipped to warehouse and whether it might not have been shipped to customers from warehouse.

As soon as I mentioned Dahlstrom, Turner said he would check up with Dahlstrom and find what he had told Madson. Turner called me back later to say that Dahlstrom was wrong and had told Madson yesterday that his original information was wrong. The present story is that *none* of this micronized LO has been *shipped out of Sayreville*. Frankly, I doubt this*

I was purposely rather sharp with Turner thruout our three telephone conversations during the day. I find it difficult to believe that Dahlstrom who is in charge of the Control Laboratory knew so little about shipments as to tell Madson that the micronized LO was being shipped and then find later that he was entirely wrong.

J. E. BOOGE
TECHNICAL DIRECTOR

JEB:DEE

*Dahlstrom told Madson *yesterday* that it *was* being shipped but had not been sold! Turner and Dahlstrom still do not agree.

3/1/40

EXCHANGE OF INFORMATION WITH T. P.

The exchange has been in force some seven years (Agreement dated January 1, 1933). One motive for discontinuance is the purely selfish one that T. P. has benefited more than Krebs.

Adoption of Krebs TiO_2 Process—About one year after the Agreement, T. P. changed their TiO_2 process at St. Louis, adopting the Krebs process completely. This included particularly copperas removal, Krebs hydrolysis process, acid washing for improved color and wet grinding subsequent to calcination for improved fineness.

This wiped out the extremely large quality advantages previously possessed by Krebs TiO_2 and allowed T. P.'s agressive Sales Department to stop Krebs' previous rapid advance in sales. This is indicated by the following table showing the ratio of Krebs' sales to T. P.'s sales (basis total TiO_2 content of all pigments).

Year	Krebs/T. P	Year	Krebs/T. P.
1932	40%	1936	109.8
1933	62.6	1937	111.3
1934	81.6	1938	107.4
1935	106.3	1939	94.0

Later Duplication of Important Improvements—During the last few years, practically every important quality improvements or new grade of TiO_2 introduced by Krebs has quickly been duplicated by T. P. The delay has ranged from approximately 3 months for CR TiO_2 down to a few days for many grades.

A few improvements have been initiated by T. P. and adopted by Krebs,—it is not intended to indicate that the exchange was entirely one-sided.

D. P. Exhibit 61

The situation on extended pigments has been similar to that on TiO_2, T. P. quickly adopting improvements and new grades. This included adoption of the Krebs $CaSO_4$ process with resultant improvement in Titanox-C quality.

As a consequence, Krebs has not been able to cash in to a great extent on improvements and new developments. "TI-CAL" forms somewhat of an exception where T. P. was slow to duplicate the fine SF "TI-CAL" and has not aggressively promoted the HO and MX types. Consequently, our combined sales of these three grades make up over 50% of total "TI-CAL" sales.

The exchange of information has become known to the Sales Departments of the two companies and to the trade generally, making it still more difficult to capitalize on new or improved grades of titanium pigments saleswise.

Savings Items—T. P.'s original TiO_2 costs at St. Louis and Sayreville ranged around 10¢/#. Their adoption of the Krebs TiO_2 process was followed by frequent visits to Krebs plants which finally resulted in bringing the T. P. operations into line with Krebs and brought their TiO_2 manufacturing costs down to somewhere near our level (not exactly known). As an indirect result of this decrease in TiO_2 cost, T. P. has been able to aggressively reduce selling prices.

To summarize, the exchange of information has had the net result of maintaining T. P.'s quality at about the same level as Krebs' quality and has robbed both parties and notably Krebs of any chance to profit saleswise from new quality developments. This situation has undoubtedly had a major influence on the sales trend whereby T. P. stopped Krebs sales advance and is now aggressively cutting into the Krebs sales field. In my opinion, the best

means to correct this situation is to step out qualitwise by aggressive research and, if it is not too late, partly regain our superior quality and cost position of January 1, 1933.

We have several major studies underway with which T. P. is not as yet familiar. The most important is development of a white pigment Rutile. This study is still on a laboratory scale but shows definite possibilities of producing pigment Rutile. The indicated hiding power is approximately 20% to 40% higher than present "TI-PURE" (under different conditions of use) with an increased manufacturing cost which may not be more than 1¢/#. In my opinion, there is at least a 50-50 chance of satisfactory Rutile production within the next two or three years, and if so, it is probable that Rutile will largely replace present anatase.

From the purely selfish standpoint, Krebs' future position in the titanium industry will largely be determined by the period during which it is the only rutile producer and later by the comparative quality of the Krebs rutile and other rutiles when and if they appear. It is, of course, entirely possible, that T. P. will place rutile on the market first, but in my opinion, it is much better to take this chance than to continue the present Agreement.

April 8, 1941

Mr. G. A. McCorkle
Nemours Bldg.

I recently saw another advertisement by T.P. stating in aggressive language that *they* have originated *all* improvements in titanium pigments. I was beginning to be impressed by these claims myself so I took a little time out to "look at the record". The following may be of interest:

1. *Wet Ground TiO_2*—Originated by Commercial Pigments about 1928 (based on Krebs patented process) Copied by T.P.
2. *Improved Color TiO_2 ("C" Process)*—KREBS—Copied by T.P.

*3. *CR Grade TiO_2*—KREBS—T.P. came out three months later.

*4. *"Y" Type TiO_2*—KREBS (Influenced by English development)—T.P. stole a march by combining "Y" and CR and deserve credit.

*5. *"O" Type TiO_2*—KREBS—T.P. actually released a few days before Krebs following six months trial of Krebs "O" by the trade.

It should be noted that Krebs has basic patent protection of both "Y" and "O" pigments after winning interferences with T.P.

6. *AT TiO_2*—Krebs—Minor—Based on English practice

7. *A-24*—Originated by T.P.

8. *51 Type TiO_2*—Krebs

*9. *Rutile*—Extended rutile by T.P.—pure rutile by Krebs

"Ti-Cal" *Developments*

1. "Ti-Cal" HO—Krebs

2. "Ti-Cal" SF, Fine Texture Type—Krebs

3. "Ti-Cal" MX, Mix-In Type—Krebs

Practically all "Ti-Cal" developments were seemingly Krebs up to the extended rutile grades put out by T.P.

April 9, 1941

You will be interested in the following letter received from Sawyer covering his inspection of the T.P. St. Louis plant from outside of the grounds. I judge that St. Louis is being expanded to 300 tons/day of extended pigments,—the ten attack tanks would indicate this capacity.

"It looks as if T.P. will have 300+ tons of extended pigments within a couple of months. There are now ten attack stacks—two very new, not yet used, and one recognizably newer than the rest. An attack went off in that tank while I watched. Two new kilns are in but the building is still open on both sides. Four new mills are in although the return duct from the collector of one is not yet hooked up. The dry grinding building is still open on the south to give a clear view of the collectors. The kiln feed filters are on a flat car in the yard. The whole plant is a beehive of construction activity. We might have had a tip-off on RC-HT if we had had a look at the plant four months ago. The whole combination looks like extended rather than pure."

BALTIMORE PROJECT No. 1508—$30,800

PRESSURE WATER FILTERS WITH ELEVATED TANKS

Project herewith presented provides for installation of water filters and accessory tanks at Baltimore plant. Estimate by the Engineering Department places cost at $30,800.

Heretofore filtering of process water obtained from city mains at Baltimore has not been considered necessary, as regular and frequent laboratory tests showed no unusual variation. During the past year, however, the water has shown serious contamination at times and on one occasion sufficient to cause shutting down plant for some hours in order to avoid pigment spoilage. A filter test approaching plant scale operation was recently conducted, which demonstrated an appreciable residue of iron oxide and metallic iron being collected. While this was not evident from routine laboratory tests, it is now shown that impurities are present in sufficient amount to have a very decided deleterious effect on pigment color.

Competition has so improved color of titanium dioxide as to place our product on the defensive. The problem is being actively studied, with promising results. The amount of residue revealed by this test is sufficient to cause a two point drop in our pigment color scale. This, together with

D. P. Exhibit 64

the known occasional lapses in quality of water over the past year, makes it imperative that filters be installed. The Edge Moor plant is already so equipped.

It is, therefore, recommended that this appropriation be authorized as a quality necessity.

EDGE MOOR PROJECT NO. 2207—$69,900.00 RAYMOND MILL AND AUXILIARIES FOR "TI-CAL" SF AND "TI-PURE" LW GRINDING

The project herewith presented provides for an additional Raymond mill and auxiliary equipment at Edge Moor plant, necessary to meet:

(1)—Improved quality requirements for "Ti-Cal"

(2)—Permit production of "Ti-Pure" LW (dry ground TiO_2).

Three Raymond mills were installed at Edge Moore to provide for plant capacity of 60 tons "Ti-Cal" per day. Operating on regular grades of "Ti-Cal" each mill is capable of grinding 20 tons per day. However, competition, with greater and more flexible grinding capacity, has placed on market a superfine product which we have matched and further improved with a new grade called "Ti-Cal" SF, but which can only be produced at a rate of 10 tons per Raymond mill per day. In other words, the grinding capacity is cut in half when operating on improved grade.

Several important accounts have adopted this grade and its use is growing. Therefore, with "Ti-Cal" business in general increasing steadily, our existing business will be seriously jeopardized unless we quickly place ourselves in position to meet this improved quality requirement.

While definite quality requirements for "Ti-Cal" alone are the basis for this project, another very important pur-

pose is served. At present Edge Moor can produce certain quantities of dry ground "Ti-Pure" in excess of present and immediate forecast quantity of TiO_2 required for extended titanium pigments. For sometime past, with "Ti-Cal" sales still below plant capacity, we have utilized one Raymond mill to produce "Ti-Pure" LW grade, but with "Ti-Cal" sales increasing, and quality demands cutting capacity, this cannot be continued.

Baltimore has a rated capacity of 70 tons TiO_2 per day, and for March and April total sales of TiO_2 were 74.5 and 78.4 tons per day respectively, so that production of "Ti-Pure" LW at Edge Moor was necessary. This will probably continue to be so in face of the forecast of 66.89 tons per day for this year, and 69.86 tons for 1938.

As long as "Ti-Cal" sales permit, this additional mill will allow sufficient flexibility to enable us to produce "Ti-Pure" LW at Edge Moor as required, and relieve Baltimore to that extent. However, if demand for superfine "Ti-Cal" increases further, even this mill will be insufficient, and more grinding capacity necessary.

Any future expansion in pure titanium dioxide will probably be placed at Edge Moor, and studies are under way in preparation for such necessity. Consequently, any grinding equipment installed at Edge Moor will fit in perfectly with ultimate plans.

It is, therefore, strongly recommended that this project be approved on the basis of a quality necessity, which at the same time will allow a certain flexibility in TiO_2 production to relieve strain on the Baltimore plant.

LICENSE AGREEMENT WITH NATIONAL LEAD COMPANY COVERING MICRONIZER REDUCTION MILLS

APPROPRIATION REQUEST NO. 4282—$65,400.00 MICRONIZERS AND FAN FOR BALTIMORE PLANT

On April 5th this Department orally requested authorization from your Committee to execute a license agreement with National Lead Company to process titanium pigments under International Pulverizing Corporation U.S. Letters Patent No. 2,032,827, covering a micronizer reduction mill, and to proceed with purchase of mills, the cost of which, together with accessories and installation, was estimated to be around $100,000, of which approximately $60,000 would be spent at the Baltimore plant and $40,000 at Fore Moor.

Informal approval was granted and we now submit the above for formal approval, as follows:

1—Non-exclusive license agreement with National Lead Company, which has been approved by the Legal Department, and attached thereto copy of agreement between International Pulverizing Corporation and National Lead Company, giving the latter right to sub-license:

D. P. Exhibit 68

(a) Under our license we acquire the same benefits, privileges, and immunities as National Lead Company possesses.

(b) Micronizer mills installed remain the property of International Pulverizing Corporation, but in event of cancellation of license due invalidation of patent, the mills with all improvements pass to ownership of du Pont.

(c) Du Pont agrees to pass on to International rights to all improvements and information on operation of the mills themselves, but nothing regarding the licensed materials processed.

(d) Du Pont admits validity of patent and agrees not to contest during period of license, but du Pont has right to cancel for any reason whatever on three months' notice.

(e) International Pulverizing Corporation guarantees to hold du Pont harmless against any infringement suit by third parties.

(f) Royalty to be paid at rate of 50¢ per ton for first 4000 tons, and 25¢ per ton for each ton over 4000 tons in any accounting year, such royalty to be computed and based on aggregate tonnage of National and all sub-licensees; no minimum royalty is provided.

(g) At 50¢ per ton rate, it is estimated royalty will amount to $325 per month on such grades as we expect to process in near future, but on combined basis with National will undoubtedly result in lower rate.

2—Project No. 4282 for $65,400 to cover purchase and installation of micronizers and high speed fan for fine grinding at Baltimore plant;

(a) No saving is involved and equipment is required solely to produce titanium dioxide of improved texture, and higher gloss in finishes, in order to maintain competitive position.

(b) Grinding operating cost through micronizers, including royalty, is now estimated to be about equal to or possibly up to 50¢ per ton higher than present methods. Fan cost is expected to be upwards of 50¢ per ton less than micronizer grinding.

(c) High speed fan included in project, for pigments falling outside low oil absorption range, would have been required in any case to provide supplementary dry grinding necessary to obtain normal capacity from Raymond mill at Baltimore, authorized by Executive Committee under Project No. 3719, August, 1938, and explained therein.

Project for approximately an additional $40,000 to cover equipment for Edge Moor plant is in preparation and will be submitted to a member of Executive Committee for formal approval.

Project estimates are of high spot nature, due to speed necessary to place ourselves in competitive position, and unfamiliarity or lack of experience with types of equipment being installed.

Management is proceeding with purchase of mills and execution of license agreement in accordance with informal authorization previously granted.

C. H. RUPPRECHT
GENERAL MANAGER

D. P. Exhibit 68.

REASONS FOR MAKING THIS EXPENDITURE

1. PRESENT FACILITIES AND TO WHAT EXTENT THEY HAVE INADEQUATE.

Pigment quality improvement through improved methods of dry-grinding has been intensively studied by manufacturers of grinding equipment and by our own Engineering Department for several years.

This work has now reached a point where definite performance has shown that substantial changes and improvements in various finished pigment properties can be obtained in two newly available types of grinding units. These units are:

(1) Mikronizer manufactured by International Pulverizing Co.

(2) High speed fan developed by du Pont Engineering Dept.

The Mikronizer consists of a simple cylindrical chamber in which grinding action is obtained by subjecting particles suspended in a stream of steam to attrition upon themselves and at the same time permits a degree of particle size classification which insures that the oversize particles are retained in the chamber until reduction in size is obtained.

The high speed fan consists of an impeller which operates at high speed and develops grinding action in three ways:

(a) Attrition of particles against blades as the particles pass through the impeller.

(b) Impingement against wear ring or anvil located around periphery of impeller.

(c) Attrition of the particles upon themselves due to air velocity.

Both of these units effect substantial improvement in pigment fineness or particle size reduction as compared with that obtainable from any other type of grinding equipment now available. This improvement in fineness is accompanied by an improvement in gloss of paints formulated with t' ese pigments and at the same time gives the pigment consumer an advantage in reducing the amount of grinding required in his mills in the manufacture of paints, inks, etc.

The action on the pigment as obtained in the Mikronizer further causes a definite reduction in the oil absorption of the finished pigment. This is a very desirable change in certain pigments but in others cannot be tolerated. Consequently, because of the oil absorption reduction obtained, the Mikronizer will probably be the more desirable unit in making pigments for enamels, etc., where low oil absorption is desired, whereas the fan will find its most important use in the manufacture of other types of pigments where the higher oil absorption is necessary.

The National Lead Co. has obtained license to the use of the Mikronizer in grinding titanium pigments and we have obtained a sub-license from them under similar terms. We consider it absolutely essential to install Mikronizers for dry grinding LO grades of TiO_2 at Baltimore in order to avoid a probable serious loss of business to a competitive manufacturer who would be in the position of selling TiO_2 with important quality advantages which would otherwise not be available to us. Consequently, we are recommending the installation

of two Mikronizers which would have sufficient total capacity (approximately 20 tons per day) to handle all of our LO grades of TiO_2 now sold.

At the same time we are recommending the installation of one high speed fan. It is regarded as entirely probable that the high speed fan might be further developed to give a degree of fineness not obtainable in the Mikronizer and, further, that the fan which is free from royalty might be operated at substantially lower cost than the Mikronizer on an equal quality basis. The reduction in oil absorption as obtained in the Mikronizer, however, might make it necessary to use this particular unit on certain grades regardless of differences in cost or other pigment properties.

Our estimates indicate that grinding costs (including royalty of 50¢ to 25¢ per ton) for the Mikronizer will be approximately equal to or up to 50¢ per ton higher than present costs for producing our LO grades of TiO_2 which are roller milled and pulverizer (in combination) ground. Actual capacity obtained from Mikronizer will be governing factor on unit costs obtained.

The installation of the high speed fan at Baltimore has been definitely under consideration for some time. Project 3719 was approved in August, 1938, for one Raymond type roll mill at a cost of $52,500.00. In order to get a normal capacity of 20 tons per day from a roll mill it is usually installed in combination with a supplementary grinding unit called a pulverizer. A pulverizer unit costs an additional $10,000.00. When this last roll mill was installed at Baltimore the experimental work on the high speed fan indicated that the further program would show a definite superiority in that unit

as compared with the pulverizer. Consequently, the roll mill was installed without any supplementary grinding unit and which set-up permitted operation at only 50% of capacity. This rate of output was estimated to be sufficient to take care of requirements until about the middle of 1939 and by which time it was assumed data would be available to show practicability of the fan. Such data is now available and the fan can be installed to supplement the roll mill at a cost of $20,000.00 instead of the $10,000.00 figure for the pulverizer. The improved fineness obtainable from the fan in itself is sufficient justification for the additional expenditure. Further, it is believed that in addition to bringing the capacity of the roll mill up to 20 tons per day, the fan may also permit of production rates considerably higher than this figure or, in other words, will represent a definite economy over the pulverizer.

2. KNOWN LOSS (IF ANY) PER ANNUM UNDER PRESENT CONDITIONS

3. DESCRIPTION OF PROPOSED WORK

Two Mikronizers will be installed with feed and discharge arrangements of a temporary nature to maintain maximum flexibility and to permit of development of accurate information on different types of material which will be processed through the Mikronizers, grinding rates on each, etc. After such data is available proper mechanical equipment will be installed for satisfactory operation.

Mikronizers to consist of steel shell with chromium plated lining to minimize tendency of pigment to stick

to mill sides. Steam to be fed at 100 lb. pressure. Superheater to be installed to heat steam to maximum of 750° F. Machine to be vented to atmosphere for release of steam and hot gases and entrained fine pigment estimated at 1% maximum. After definite information is available on pigment loss, recovery equipment will be installed if justified.

The proposed high speed fan to be constructed of chrome steel alloy with special heat treatment for hardening. Fan impeller speed 12,000 r.p.m. The fan at Baltimore to be steam turbine driven to take advantage of exhaust steam supply which can be satisfactorily used at Baltimore.

The high spot estimated cost of proposed work is as follows:

Dismantling and Moving	$ 820.00
Superheater	23,700.00
Micronizers, Bldg. #4	17,940.00
Fan, Bldg. #4	22,940.00
	$65,400.00

EXECUTIVE COMMITTEE

LICENSE AGREEMENT WITH NATIONAL LEAD COMPANY AND PURCHASE OF MICRONIZER REDUCTION MILLS:

The following resolutions were offered and unanimously adopted:

RESOLVED that, subject to approval of the Director or Assistant Director of the Legal Department, C. H. Rupprecht, General Manager, or Zack Phelps, Assistant General Manager, Krebs Pigments Department, or the President or any Vice-President of this Company, together with the Secretary or an Assistant Secretary, be and they are hereby authorized to execute on behalf of the Company a license agreement with National Lead Company for a sub-license for processing of titanium pigments under International Pulverizing Corporation's U. S. Letters Patent No. 2,032,827, covering a micronizer reduction mill, in accordance with the brief resumé of terms orally outlined by Mr. Rupprecht at this meeting;

D. P. Exhibit 69

RESOLVED FURTHER, that the Krebs Pigments Department Management be authorized to proceed with the purchase of micronizer reduction mills, the cost of which, together with accessories and installation, is estimated to be around $100,000, of which approximately $60,000 will be spent at Baltimore Works and $40,000 at Edge Moor Works, it being understood that the order for the purchase of these mills will not be entered until the above-mentioned approval of the Legal Department is obtained, and that formal appropriation request will be submitted in due course.

This is to certify that the foregoing is a true and correct copy of resolution unanimously adopted by the Executive Committee of E. I. duPont deNemours & Company at meeting held on April 5, 1939.

[SEAL]

D. P. Exhibit 70

July 17, 1939.

TO: EXECUTIVE COMMITTEE

FROM: KREBS PIGMENTS DEPARTMENT.

PROJECT NO. 4222—$133,300—OLIVER FILTERS FOR PIGMENT WASHING—BALTIMORE

PROJECT NO. 4236—$150,900—PRE-DRIER INSTALLATION—BALTIMORE

The two above projects, representing a total expenditure of $284,200 at Baltimore plant, are submitted simultaneously, as their objectives are closely knit together and thus avoid repetition.

In recent months our principal titanium dioxide competitor has placed on the market several distinctly improved grades, combining better pigment dispersion, improved paint gloss, and lower grit (all very important properties), which grades have already cut in on some of our trade, and unless duplicated will make serious inroads on our established business. An extensive study to achieve similar improvements without such a major capital expenditure was undertaken by our Research and Industrial Engineering groups, but without success, and we are now in the position where it is imperative that we equip to at least equal competitive products, or suffer appreciable loss of business.

Project No. 4222—$133,300—"Oliver Filters for Pigment Washing"—provides for additional washing repulp tanks for raw pigment, followed by two Oliver washing type filters, with all necessary accessory equipment.

Project No. 4236—$150,900—"Pre-Drier Installation"—provides for two chain belt driers for pre-drying of pig-

ment before delivery to present finishing driers of the rotating cylindrical type, equipped with steam tubes.

The proposed supplementary repulping and washing equipment is required to permit an additional operating step involving the precipitation of aluminum sulphate which has previously been added to the pigment slurry, to aluminum oxide with ammonia in the presence of TiO_2, and washing to eliminate the soluble ammonia present. Very marked improvement in pigment dispersion and higher gloss in paints results.

The proposed pre-drier overcomes objectionable grit in finished pigment, caused by TiO_2 of high moisture content in direct contact with steam-heated tubes in final drying, forming into hard cake on the hot tubes. The pre-drier feeds half dried cake to finished driers, which avoids sticking to tubes and resultant caking and grit.

There is nothing speculative about either installation. By using filter presses from other operations to produce limited quantities, we have confirmed results to be obtained by additional and improved washing, and by shipping TiO_2 slurry to Newark for preliminary drying on lithopone festoon driers and returning to Baltimore for finishing, we have confirmed beneficial effect of pre-drying. Material so produced is equal in every respect to the improved competitive qualities, and offers opportunity for further improvement toward achieving optimum pigment fineness and accompanying improved gloss in paints.

No savings will result and only absolutely necessary quality improvement is involved. Additional operating costs are very slight and may be eliminated with experience.

Question may be raised as to what bearing these improvements have on recently approved micronizer mill in-

stallations for fine texture. The answer is that these proposed steps in the operation further improve dispersion and fineness, enabling still greater improvement in the final micronizer grinding which follows, than can be obtained from present pigment.

Temporary steps have been set up to make very limited quantities of improved pigment by make-shift and costly procedure, and the need for quick installation of proposed equipment is very urgent.

It is recommended that these two projects be authorized as absolutely essential to the maintenance of our present position in the titanium dioxide industry, and to enable us to expand sales against competition.

APPROPRIATION REQUEST NO. 4519—$49,516.00
FILTRATE THICKENERS FOR WASHING FILTERS AND CENTRIFUGE FOR CR PIGMENTS

Project is herewith submitted calling for pigment centrifuge and filtrate thickeners at the Baltimore plant, which are required to meet competitive quality and new grades.

It is necessary that we have this additional equipment to avoid contamination of other grades due to specific treatment of the newest grade of titanium introduced, which is an antimony-treated product and which gives promise of becoming one of the most popular pigments for the paint industry.

We definitely require the additional centrifuge and thickeners in order to maintain quality of this grade in particular, and thus be able to hold other grades in line, protecting us against losing business to competition.

This project is wholly necessary for quality reasons, and it is, therefore, recommended that it be submitted to a member of the Executive Committee for approval.

APPROPRIATION REQUEST NO. 4942—$72,800.00
2 MICRONIZERS FOR EDGE MOOR PLANT

Attached is appropriation request to cover installation of two micronizers and auxiliary equipment at Edge Moor, these grinding units being similar to the one micronizer (authorized May, 1939) which was put in operation last month.

Our experience has shown that this micronizer has effected the expected improvement in the quality of "Ti-Cal" through lowering the grit content, and offerings of this improved product have been well received by paint manufacturers.

We are informed that one of our competitors, who originally installed one micronizer, has already placed order for two additional units and will improve the quality of some of their other grades of calcium base titanium pigment. We consider it essential that we likewise equip to meet this competition, or risk facing serious inroads on our established business. There are definite indications that there will be an increasing demand for our present micronized grade of "Ti-Cal", and additional micronized capacity will be necessary to satisfy these requirements.

We, therefore, recommend that this project be approved to permit us to order and install two additional micronizers at the earliest possible date, and enable us to at least maintain our competitive position on quality.

To: EXECUTIVE COMMITTEE

FROM: KREBS PIGMENTS DEPARTMENT

APPROPRIATION REQUEST NO. 5897—$152,000 FACILITIES FOR PRODUCING 20 TONS PER DAY RUTILE TYPE TITANIUM DIOXIDE PIGMENT AT EDGE MOOR

Attached is appropriation request for $152,000 to cover installation of equipment at Edge Moor to manufacture our newly developed rutile type titanium dioxide pigment at rate of 20 tons per day.

Present TiO_2 ("Ti-Pure") is what is known as anatase crystal type. It has always been recognized that the rutile crystal type would possess appreciably greater opacity, so that research toward development of such a pigment has been in progress almost from the start of our TiO_2 manufacture in 1931.

Until some few months ago research results were very discouraging, in that it appeared the only commercially adaptable process for manufacturing a rutile pigment would require erection of almost entirely new plants, and obsolete much of present costly investment. We can now report that we have succeeded in working out a particularly favorable process, which will permit manufacture of such pigment in our existing TiO_2 plants, with relatively moderate additional capital investment and with no additional by-products to further complicate waste disposal problem.

The patent situation has been carefully studied and we will not be handicapped by any known patent problems, and

while it is too soon to say that we will hold a dominating position, we believe definitely that no patents stand in the way of our development, further details of which are given in reason sheet.

There is every reason to believe that one active competitor and one prospective competitor are at work on this important pigment. It is highly important that we install equipment to produce rutile pigment on commercial scale at the earliest possible date, and by proceeding at once we should be able to offer such product for sale by February, 1941. We hope to be first in the field with a rutile pigment, which will in itself be a distinct advantage, and, likewise, thus protect our existing TiO_2 business against competition offering such product at any future date. It cannot be emphasized too strongly that a competitor preceding us with such product will have a considerable advantage, and we would find ourselves in a very embarrassing sales position.

Our proposed product has been worked out on semi-works scale, and pilot unit study is in progress. It is considered inadvisable to hold up commercial plant construction for completion of piilot unit work, inasmuch as results to-date are so satisfactory and encouraging that we do not anticipate difficulty in going to plant scale operation, and our Research Department is confident that we will have completed necessary refinements and improvements well in advance of the plant being in readiness.

We believe that over the next five years rutile type pigment will replace to a considerable extent the present anatase TiO_2 and contribute still further to the continued growing demand for titanium pigments.

Our proposed rutile pigment is produced by our present process with one added step, and makes use of all existing plant equipment. The project herewith presented provides

for this supplementary equipment, such as cooler, tanks and filters, required for this additional step in process, to the extent of making available a minimum capacity of 20 tons per day for the rutile type product. We will be prepared and in position to convert present TiO_2 plants to produce required tonnage of rutile pigment as increasing sales demands develop, by addition of more of same type equipment as initially provided in this project.

The appropriation now requested, $152,000, will enable us to convert a minimum of 20 tons per day TiO2 production at Edge Moor to the rutile type pigment. It is estimated that an additional $650,000 investment would be required if we eventually convert the balance of our TiO_2 production at both plants to this new type pigment, and this is extremely probable.

The new rutile pigment produced at 20 ton per day rate will carry cost penalty of about 1¢ per pound over present "Ti-Pure" cost. We are using cost penalty of $.0115 per pound in project calculations, which is conservative.

Additional value to customers will justify a premium in selling price of from 2¢ to 3¢ per pound over present "Ti-Pure" price. Margin of profit will be greater than that on present pigment. We forecast that within a period of one year after the rutile pigment is offered to the trade our volume of sales will be at rate of 20 tons per day.

Estimated additional return on 20 tons per day rutile pigment over present normal profit on "Ti-Pure" will be at 29% rate if product is sold at 2¢ per pound premium, and 64% rate if premium is 3¢ per pound.

The premium in selling price can better be determined when the actual quality of our rutile pigment is standardized on commercial scale and is more completely evaluated

in the formulas in which it will be employed. We feel certain that the return will be as mentioned above; however, regardless of the additional profit on this new pigment to justify this added investment, we also consider it essential that we produce rutile pigment as a matter of protection to our existing titanium dioxide business.

It is, therefore, recommended that this expenditure be approved.

From: Krebs Pigments Department

APPROPRIATION REQUEST NO. 5897—PART III—$80,000.

"IMPROVED HYDROLYSIS EQUIPMENT AT EDGE MOOR"

Herewith is submitted appropriation request for $80,000 to cover extension of facilities for production of rutile type titanium dioxide at Edge Moor Plant.

Parts I and II of this project, totaling $175,500, were authorized for initial unit of 20 tons of this new pigment, which equipment is nearing completion and expected to be placed in operation February 1st, practically on schedule.

It was our intention to market the new rutile product in pure form at a differential of, at least, two cents per pound over our present TiO_2 standard, which would show a fair return on investment. However, on January 13th, one of our competitors, National Lead Company, announced to the trade and immediately began distributing samples of two extended calcium base titanium pigments (30% TiO_2—70% $CaSO_4$) produced from rutile type TiO_2 and possessing 30/40% higher hiding power than their previous standards (similar to our "Ti-Cal") but selling at the same price as existing standards, 5¼¢ per pound carloads.

This presents a very serious threat to our entire calcium titanium pigment business because of the much greater money value offered the customer in these new products. Consequently, the adoption and substitution of these pigments is expected to be very rapid.

D. P. Exhibit 78

We have hurriedly prepared blends of our pilot unit rutile with Edge Moor $CaSO_4$ and can produce a very good counter-offering for the more important of the two new competitive pigments, and show indications of better color for our pigment. We are, therefore, preparing sufficient quantities of blended pigment from pilot unit operations for distribution of five-pound samples and mailed announcement of this new pigment to the trade on January 23rd, together with simultaneous announcement of our pure rutile pigment. We will be in position to supply these five-pound samples within a few days and larger quantities of the extended product by February 15th.

Competition offering their new extended pigments with no price advance is aimed at the lithopone market (150,000 tons sold in 1940, and at the same time lowers the value of our present "Ti-Cal." Our plan to charge a two-cents per pound differential for the pure product is now made impossible, but we intend to add one cent per pound to our present price and hope we can maintain this. Cost increase on our pure rutile is still estimated at slightly over one cent per pound but confidently expected to be brought down to not more than one-half cent per pound with plant experience.

Why competition introduced their rutile pigment in the extended form and not the pure is very much of a mystery, but we are hopeful that it means their process is causing color difficulties. These would be somewhat minimized in the extended pigment.

By announcing our products and making samples available promptly, we will divert the attention of the trade and accomplish some delay, but this makes it imperative for us to become equipped to manufacture the rutile pigment to

D. P. Exhibit 78

the capacity of the Edge Moor plant as quickly as possible.

Project here submitted will enable us to produce the rutile type pure TiO_2 at Edge Moor to the capacity of that plant, which is now rated at 70 tons per day. The equipment already installed under Parts I and II of this project was set up as required for a — "seed", but pilot unit experimental results permit adoption of — "seed" at the start of our plant operations, and we expect to be down to a — "seed" before very long. Consequently, the capacity of the plant for the important step of "seed" preparation as now installed is considered sufficient. There is no question of capacity for the "Ti-Cal" production, where it will be a matter of careful scheduling only.

Under these conditions it is almost impossible to forecast rate of sales, and no earnings figures are being submitted since market and competitive conditions will be very chaotic and disturbed for some months. It is unfortunate that competition was first to introduce a rutile type product in this extended form, but we will be first in the market with the pure rutile product and are fortunate that our construction has reached the point where plant operation is imminent so that we can introduce our product, but the urgency for additional capacity for processing pure rutile cannot be overemphasized as the situation is critical.

It will unquestionably be necessary to equip Baltimore for producing rutile grade before long, and work order has been put in preparation.

It is, therefore, recommended that this project be authorized as a matter of utmost expediency and urgency to protect our titanium pigment sales and heavy investment.

From: Krebs Pigments Department

Appropriation Request No. 6899—$514,300

Additional Equipment to Produce Rutile Titanium Dioxide Baltimore Plant

Request is herewith submitted for $514,300 for equipment to produce rutile type of pure titanium dioxide at Baltimore plant.

While the over-capacity demand for our regular anatase product has prevented production of pure rutile pigment at Edge Moor to the extent of more than enough tonnage to permit customers to purchase quantities sufficient for plant trial runs, the response is such that all indications point to rapid substitution of rutile for anatase once material is available. As a matter of fact, the introduction of the product and inability to supply is proving very embarrassing.

Edge Moor has been equipped to produce its full capacity of 70 tons per day (24,080 tons annually) as rutile pigment, but of this 30 tons must be reserved for calcium base pigment; another 13 tons for remaining extended pigments; thus leaving only 27 tons a day (9300 tons annually) for sale as pure rutile. Our extended calcium rutile pigment, "Ti-Cal" R, will represent one-third of our total "Ti-Cal" sales for April, which is limited only by tonnage which has been available.

D. P. Exhibit 81

As our principal competitor is informing trade they will place pure rutile pigment on market shortly, and as interest in the rutile product is such that we are forecasting the pure rutile pigment will replace anatase to the extent of at least 75% as soon as available in 1942, we consider it imperative to equip Baltimore to produce its capacity, (70 tons a day or 24,080 tons annually); as rutile pigment, as quickly as possible.

At Edge Moor we have a dual system which enables shifting from one type of pure pigment to the other, and in order to avoid duplication of this expensive investment it is planned to confine Baltimore operations to rutile, and whatever anatase may remain can be supplied from Edge Moor.

The total estimate of $514,300 to install equipment for 70 tons per day rutile at Baltimore is, unfortunately, $218,178 higher than the amount which was required to equip Edge Moor for the same tonnage. The principal items contributing to this increase over Edge Moor are building requirements; limitations in existing equipment; increased cost of filter conversion; several items included on justifiable savings basis; and increased engineering supervision and design costs, as follows:

Buildings, warehouse, dismantling and moving	$41,820
Conveyor and dump truck for waste materials	11,660
Catch-all tank, pumps and piping, due no tankage cut-offs possible as at Edge Moor	17,300
Conversion of 8 more Moore filter trucks to bag type than at Edge Moor, due smaller size at Baltimore	36,215

D. P. Exhibit 81

Temporary construction sheds and tools (Edge Moor used facilities remaining from previous expansion job just completed)	11,440
Increased labor, field engineering supervision and design	29,945
For savings based on Edge Moor experience, tanks for storage of liquid raw materials substituted for dry, and rotary filters for process liquors instead of hand presses	53,100

These items account for $201,480 of the total, and on the item for $53,100, covering installations for savings, an approximate return of 54.88% is expected.

The justification for the expenditure herein requested is wholly one of quality, due to advancement in the titanium pigment art, and necessary to maintain and better our competitive position. It is based entirely on expected sale of the capacity of Baltimore plant as rutile pigment. Our regular titanium dioxide sales have been at capacity rate, in fact over-sold, and are forecast to continue. Despite and apart from present abnormal conditions, steadily increasing demand for titanium pigments is expected, and question of plant expansion is being seriously studied.

It is planned to operate Baltimore entirely on rutile pigment, and this product carries a cost penalty of approximately ¾¢ per pound over anatase; however, the product also carries 1¢ a pound selling price premium which, therefore, returns ¼¢ a pound, or $5.00 a ton profit over that on anatase. The return on new money spent under this project is, therefore, estimated to be 13.56% after deduction of undistributed expense, based on forecast sale of Baltimore capacity.

D. P. Exhibit 81

However, there can be no question that rutile, because of its much greater money value to the consumer, as well as other properties, is the titanium dioxide of the future, sales of which will rapidly displace anatase as the pigment becomes available. Close to a year will be required to complete the proposed installation at Baltimore and we consider it a matter of extreme urgency that this construction be started at the earliest possible date.

It is, therefore, recommended that this project be authorized as most expedient for the protection of our titanium pigment sales and large investment.

TITANIUM DIOXIDE—COMPETITION

As in the previous year, Titanium Pigment Company continued to be our sole active competitor. During the closing months of the year we noted greater activity on the part of Vanadium Corporation (Southern Mineral Corporation), who were offering samples quite generally throughout the trade. Many of these samples were obtained and found to be of fairly good quality, particularly in color. However, we understand that this material has been produced only on a semi-works scale and it remains to be demonstrated that this new producer can regularly duplicate this high quality in a commercial scale operation. Late in the year the Glidden Company also announced their entry into the titanium pigment field in the form of circulars distributed to consumers, stating that their affiliated company, The American Zirconium Company, would soon be in operation. No samples from this source have as yet been obtained and to our best knowledge this competitive product has not yet been released for sale. In fact, in January 1935 we filled Glidden's order for two carloads of Titanium Dioxide which is apparently required for their own consumption.

KREBS PIGMENT & COLOR CORPORATION

Annual Competitive Report

1935 vs 1934

* * * * *

PRODUCT TITANIUM DIOXIDE

	(Tons of 2,000#)
Total Capacity of Competitors—Annual Basis	33,000
Krebs Capacity—Annual Basis	25,370
TOTAL—Annual Basis	58,370
Krebs % of Total	43.5%

The above total capacity of competitors includes 2,480 tons, representing the Piney River Virginia Plant of Southern Mineral Corp., which ceased operations during 1935. The increase in total capacity over 1934 was 30,370 tons, due largely to new plants put into operation by Krebs at Edge Moor, Titanium Pigment Company at Sayerville, N. J., and American Zirconium Corporation at Baltimore.

	(Sales in Tons (2,000#)) 1935	1934
Competitors	20,000	13,500
Krebs	17,800	9,890
TOTAL	37,800	23,390
Krebs % of Total	47.1%	42.2%
Krebs % Increase	80.0%	

Note: The above estimates of production capacities and sales are on the basis of titanium dioxide content of extended titanium pigments and titanated lithopone, plus the titanium dioxide manufactured and sold in pure form.

TITANIUM DIOXIDE

We improved our position quite substantially in the titanium dioxide industry, our estimated percentage of total sales, figured in terms of pure titanium dioxide, being 47.1% for the year compared with 42.2% in 1934. Of a total of approximately 20,000 tons of titanium dioxide sold by our competitors, we estimate that our principal competitor, Titanium Pigment Company, sold 18,500 tons and the balance of 1,500 tons was sold by American Zirconium Corporation. Of the 1,500 tons sold by American Zirconium Corporation, we estimate that a large bulk of this was consumed by their affiliate, the Glidden Company, in the manufacture of paints and titanated lithopone. Their outside sales of titanium dioxide were estimated to be quite small in view of the fact that they did not offer standard quality product to the trade until late in the year. The Glidden Company's purchases from American Zirconium Corporation represent a loss to Krebs, as we formerly supplied them with most of their titanium dioxide requirements.

Of the 18,500 tons of titanium dioxide sold by Titanium Pigment Company, we estimate that 9,800 tons went into their extended pigments while the remainder, namely, 8,700 tons was sold in the pure form. Of our total sales of 17,800 tons, 1,190 tons were in the form of extended titanium pigments, 1,650 tons went into our titanated lithopone and the balance of 14,960 tons were sold as titanium dioxide.

Since our increased capacity for titanium dioxide at Baltimore was made available in the latter part of 1934, we were in position to take care of the rapidly increasing demand for this pigment whereas Titanium Pigment Company continued to be handicapped by limited capacity until

its new plant at Sayerville N.J. was completed and put into operation about the middle of 1935. Our sales of titanium pigments in terms of titanium dioxide increased 80% over 1934, whereas we estimate Titanium Pigment Company's sales increased about 37%.

TITANIUM DIOXIDE—COMPETITION

Titanium Pigment Company continued to be our sole active competitor until late in the year when American Zirconium Corporation commenced offering Zopaque, a titanium dioxide of very fair quality. The Vanadium Corporation (Southern Mineral Corporation) made some attempt to promote its pigment late in 1934 and in 1935. They made little headway, however, due to poor quality and finally discontinued operations in the fall of 1935.

We expect American Zirconium Corporation to be more aggressive in 1936, although their output is limited to 3,000 tons under their license agreement. Numerous samples of their pigment indicated appreciable improvement in quality during the year, however, it is not yet rated generally equal to our product.

We are not reporting separately our sales of extended titanium pigments, "Ti-Bar" and "Ti-Cal", for the reason that we did not start production until mid-year and our efforts during the last six months were largely promotional. Total sales for this period were 1,530 tons "Ti-Bar" and 2,237 tons "Ti-Cal". On an annual basis this would represent about 17% of the country's consumption of extended titanium pigments. The largest individual month's sales were 552 tons "Ti-Cal" in October and 358 tons "Ti-Bar" in September.

KREBS	28,560 "	30.0
Grand Total	95,200 tons	100.0%

D. P. Exhibit 86

TITANIUM DIOXIDE (In pure form)

Krebs sales of titanium dioxide (in pure form) increased 27% over 1935; however, our position in the industry continued the same as for 1935, being 66% of the total. This condition was due largely to increased sales by American Zirconium Corporation which for 1936 are estimated at 2,400 tons as compared to 1,500 tons for 1935.

EXTENDED TITANIUM PIGMENTS

Sales of our extended titanium pigments during the first full year of operation were 13,625 tons compared with 4,229 tons in 1935 (7 months). Our position in the industry increased from 9.2% in 1935 to 23% in 1936, largely at the expense of our only competitor. These pigments did, however, displace approximately 1,340 tons of competitive lithopones.

* * * * * * * *

Continued progress is expected in 1937 on all titanium pigments and dry colors. Due to continued replacement by titanium pigments our sales of lithopone are expected to be 2,000 tons less than for 1936, however, we believe that we will at least maintain our present position in this industry. Total Krebs sales are estimated at 5% over 1936.

D. P. Exhibit 87

D. P. Exhibit 87

TITANIUM DIOXIDE (In pure form)

Our sales of titanium dioxide in pure form (but also including the titanium content of our titanated lithopone) increased 6.2% over 1936. Our position in the industry, however, declined from 66.0% to 64.6%, due to:— (1) increased sales by American Zirconium Corp. which are estimated at 3600 tons as compared with 2400 tons the preceding year, and (2) decrease in our sales to Sherwin-Williams Company who stocked up heavily in the fall of 1936, prior to our increasing the price to this customer.

EXTENDED TITANIUM PIGMENTS

Sales of our extended titanium pigments during our second full year of operation were 22,000 tons as compared with 13,625 tons in 1936. Our position in the industry increased from 23.0% in 1936 to 28.9% in 1937. Our increase in sales of 8375 tons was largely at the expense of our only competitor. These pigments, however, did replace approximately 1800 tons of our lithopone and 1500 tons of competitive lithopone.

D. P. Exhibit 88

TITANIUM DIOXIDE (In pure form, including titanium content of titanated lithopone)

Our position in the industry declined from 64.6% in 1937 to 54.2% in 1938, due largely to the appearance of a new competitor in this field at the close of 1937. Our sales declined 2,341 tons, or 10.4%; competitive tonnage increased 4,750 tons. Outlined below are the principal factors contributing to these changes:

1—(a) Virginia Chemical Corporation, subsidiary of Interchemical Corporation, entered the pure titanium dioxide field as a new competitor at the close of 1937. In addition to gaining a number of friendly accounts, some of which were our losses, Virginia Chemical Corporation naturally began to supply all divisions of Interchemical Corporation, including United Color & Pigment Company, International Printing Ink Corporation and Ault & Wiborg Corporation, all of whose requirements heretofore had been placed with us, and our sales to this group alone declined 910 tons.

(b) The increase in Sherwin Williams Company's titanium dioxide consumption, estimated at about 800 tons, was given to Virginia Chemical Corporation, in particular, and American Zirconium Corporation for reciprocal reasons.

2—Both Pittsburgh Plate Glass Company and Devoe & Raynolds Company decided, for certain policy reasons, to favor Titanium Pigment Corporation and as a result our sales declined 515 tons.

3—Our transfers of pure titanium to the Fabrics & Finishes Department declined 590 tons, or 21%, due to the sharp drop in production of automotive and refrigerator finishes in comparison with 1937.

EXTENDED TITANIUM PIGMENTS

Our sales of extended titanium continued to increase in 1938 in the face of a 3.7% decline for the industry as a whole, and as a result our position in 1938 rose to 33.8% in comparison with 28.9% the previous year. The relatively good showing of the industry last year was due largely to replacement of lithopone pigments. Our increase in position, however, was due mostly to business gained from our only competitor, Titanium Pigment Corporation.

D. P. Exhibit 89

TITANIUM DIOXIDE (In pure form, including titanium content of titanated lithopone)

As a result of greatly increased usage in the consuming industries, particularly paint, titanium dioxide experienced during 1939 a growth greater than that of any other white pigment. Commencing in January, our sales mounted to near capacity levels and during the last five months of the year exceeded plant capacity to the point where it was necessary to curtail sales efforts.

Our sales tonnage increased 26.7% as compared with an estimated 42% increase for the entire industry so our position declined from 54.2% to 48.1%. Our decrease in position is attributed to:

1—An unavoidable loss of approximately 1,000 tons (actual decrease from 1938) to competition due to changes in purchasing policy at five important accounts.

2—Titanium Pigment Corporation enjoyed a larger relative share of the increased demand for titanium dioxide by reason of (a) having as the backlog of their business a number of the largest paint accounts in the country, such as Pittsburgh Plate Glass Company, Sherwin-Williams Company, Devoe & Raynolds Company, and Sears, Roebuck & Company, whose consumption we estimate as having increased considerably more than the general average for the paint industry, and (b) its sales not being restricted by any capacity limitation.

D. P. Exhibit 89

EXTENDED TITANIUM PIGMENTS

The year in question saw further improvements in quality in extended titanium pigments which enhanced their use, particularly in the paint industry where it was still evident that replacement of other pigments, especially lithopone, continued. Our sales tonnage increased 30.8% as compared with an estimated 23% increase for the entire industry so our position again advanced from 33.8% to 35.8%. Although replacement of lithopone continued, our increase in position was due mostly to gains from our only competitor, Titanium Pigment Corporation.

DU PONT	41.9	25,284	39.7	34,228
	100.0	60,284	100.0	86,228

Titanium dioxide again showed a growth greater than that of any other white pigment, due largely to increased usage by the paint industry. Exterior house paints are being reformulated with higher titanium dioxide and lower white lead content. We have benefited from Fabrics &

Finishes Department's greater consumption in this respect, however our competitors have gained to a greater extent because they have most of the business of four of the largest pigment consumers:—Sherwin-Williams Company, Pittsburgh Plate Glass Company, Devoe & Raynolds Company, and Sears-Roebuck & Company. Conversely, the industries to which we supply the major portion of their requirements—linoleum, rayon, and to a lesser extent, paper—did not register corresponding increases.

Du Pont	41.9	39.7	37.4	34,228
	100.00	100.0	100.0	91,628

Our stocks had been seriously reduced by the advance buying in December 1940 prior to price increase January 2, 1941 therefore our 1941 sales were limited largely to our production capacity. On the other hand, our principal competitor had a considerable margin of unused capacity available to meet the augmented demand with the result that all other producers, including du Pont, declined in position.

Du Pont actual sales exceeded our rated capacity by 4,245 tons, or 12.4%, partly because "Ti-Bar" and "Ti-Cal" were not operated at capacity, thereby making available more titanium dioxide for sale as "Ti-Pure".

Extended Titanium Pigments

	100.0	100.0	100.0	131,075

D. P. Exhibit 91

The 1941 changes in the capacity percentages below reflect the large increase in our competitor's capacity.

	Annual Capacity as of Dec. 31—Estimated			
	Each Producer as Per Cent of Industry			Tons
	1939	1940	1941	1941
Titanium Pigment Corp...	65.0	59.8	70.3	110,000
Du Pont	35.0	40.2	29.7	46,440
	100.0	100.0	100.0	156,440

Our competitor introduced rutile calcium titanium pigment at the beginning of 1941 and was able to gain additional business at our expense during the several months we were getting into production and building up working stocks. When pigment demand increased in the Summer and Fall, rather than increase "Ti-Cal" production to capacity operation we elected to hold it at 80% thereof and sell the titanium content of the balance as "Ti-Pure" at a greater profit. Around the middle of 1941 our competitor increased his capacity by approximately 100 tons per day and accepted new business in large volume.

Several factors contributed to our gain in sales position. We were successful in securing orders covering the major portion of U. S. Government requirements for the year.

The Glidden Company substantially increased their purchase of titanium dioxide from us by giving us a portion of their requirements when the plant of their subsidiary, American Zirconium Corporation, shut down due to lack of ilmenite. This plant has not yet resumed operation.

We secured 1,300 tons of new business on our new rutile pigment at the expense of competition following sharp decrease in demand beginning May, when we were no longer required to allocate our production because of oversold conditions.

D. P. Exhibit 92

General Preference Order M-44, effective January 1, 1942, required the allocation of titanium pigments on the basis of 1941 average monthly sales. Our titanium dioxide plants operated at capacity in 1941, but we limited our "Ti-Cal" production to 80 tons per day, selling the titanium content of the balance as "Ti-Pure" at a greater profit. By drawing on our stocks, however, 1941 sales of "Ti-Cal" exceeded production by 10%, whereas our competitor had ample production to meet sales requirements.

During the early months of 1942, with "Ti-Cal" stocks depleted, we had to restrict sales to 80 tons per day or 90% of 1941 while our competitor supplied his trade at full 1941 rate.

In March a substantial reserve stock in the pool set up by Order M-44 was available for distribution. We were required to use our portion toward making up the deficiency with our own customers whereas competitor was able to use his excess to gain business from our accounts.

When a sudden decline in May caught consuming industries with large inventories we were not able to recover our position.

D. P. Exhibit 93

Our increase in sales position was due, we believe, to our better relative rate of production compared with our principal competitor. This was made possible by drawing on our stock of Quilon ore to supplement our insufficient supply of Adirondack ore. Deliveries of this domestic ore to our competitor and ourselves were considerably below original estimates; however, according to our best information our competitor has had no Indian ore to draw on.

Our plants operated throughout the year at maximum rates consistent with the ore situation. Sales demand exceeded production every month and finished product stocks were exhausted by mid-summer. During the last half of the year our sales were limited by our capacity to produce.

D. P. Exhibit 93

During the early months of 1943 we restricted our production of "Ti-Cal" titanium calcium pigment to 70 tons per day and for the last half of the year imposed a further restriction to 60 tons per day, selling the titanium content of the balance as "Ti-Pure" at a greater profit.

These rates of production did not permit us to satisfy the full demands of our customers for "Ti-Cal". Our competition, on the other hand, having large reserve of finished product stocks and ample capacity, was able to gain considerable business from our accounts, hence our loss in sales position.

We are able to partially offset our loss by the substitution of lithopone for "Ti-Cal" with a number of our good accounts.

ORIGINAL

CONTRACT

KREBS PIGMENT & COLOR CORPORATION

KREBS PIGMENT & COLOR CORPORATION hereby agrees to sell and ship

and GLIDDEN COMPANY, CLEVELAND, OHIO

agrees to purchase and receive the products specified below, for the buyer's own consumption, during the period beginning August 25, 1932 and ending August 25, 1933 on the following conditions and terms:

In the event of fire, strikes, accidents or other like causes, beyond the control of either party, interfering with the production, consumption, or transportation of the goods herein described, deliveries under this contract, during the period required to remove the cause or repair the damage, shall be cancelled. Each delivery to stand as a separate transaction, and if the Buyer fails to fulfill terms of purchase or payment under this or other contracts with Seller, Seller shall have the option of cancelling the undelivered portion thereof. The Seller's liability for damages under this contract shall in no case exceed the purchase price of the particular shipment with respect to which such damages are claimed.

The Seller may decline to make deliveries on this contract, except for cash, whenever the Seller, for any reason, shall have any doubt as to the Buyer's responsibility, and so advise the Buyer; whereupon the Buyer shall have the privilege of satisfying the Seller of his responsibility and when the Seller is so satisfied then delivery shall be made or renewed on per above terms.

The total quantity to be taken in about equal monthly shipments of each article. The Seller may decline to furnish more than the pro-rated amount of the maximum quantity in any one month. Any tax on sales, and/or other tax levied by the United States Government affecting the commodities herein sold, shall be paid by the buyer. This contract shall bind and inure to the benefit of the successors and assigns of the parties hereto respectively.

QUANTITY	PRODUCTS	PRICE
Buyer's ~~Total~~ Requirements	Ground Calcined Titanium Dioxide	15½ cents per pound in carloads.
all our letter 10/14	Unground Calcined Titanium Dioxide	14½ cents per pound in carloads.
	In the event of it being possible for the Buyer, during the life of this contract, to purchase material of equal quality at a lower price than herein mentioned, he shall give the Seller proper evidence of same and the Seller will have the option of meeting such price or permitting Buyer to purchase elsewhere at the lower price.	

PACKAGES: Barrels approximately 250 or 300 pounds net weight.

DELIVERY: Sales are f.o.b. Baltimore, Md., with actual freight allowed not to exceed 50 cents per 100 pounds.

TERMS: [redacted] 1%, 10th Proximo.

Accepted: GLIDDEN COMPANY

No. 1130 89

In the Supreme Court of the United States

OCTOBER TERM, 1945

THE UNITED STATES OF AMERICA, APPELLANT

v.

NATIONAL LEAD COMPANY, TITAN COMPANY, INC., AND E. I. DU PONT DE NEMOURS AND COMPANY, INC.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE SOUTHERN DISTRICT OF NEW YORK

STATEMENT AS TO JURISDICTION

In the District Court of the United States for the Southern District of New York

Civil Action No. 26–258

UNITED STATES OF AMERICA, PLAINTIFF

v.

NATIONAL LEAD COMPANY, TITAN COMPANY, INC., AND E. I. DU PONT DE NEMOURS AND COMPANY, DEFENDANTS

STATEMENT AS TO JURISDICTION

In compliance with Rule 12 of the Supreme Court of the United States, as amended, the United States of America submits herewith its statement particularly disclosing the basis upon which the Supreme Court has jurisdiction on appeal to review the judgment of the District Court entered in this cause on October 11, 1945. A petition for appeal was filed on December 10, 1945, and is presented to the District Court herewith, to wit, on December 10, 1945.

JURISDICTION

The jurisdiction of the Supreme Court to review by direct appeal the judgment entered in this cause is conferred by Section 2 of the Expediting Act of February 11, 1903, as amended (32 Stat. 823; 36 Stat. 1167; 15 U. S. C. 29), and Section

238 of the Judicial Code, as amended (36 Stat. 1157; 38 Stat. 804; 43 Stat. 938; 28 U. S. C. 345).

The following decisions sustained the jurisdiction of the Supreme Court to review the judgment on direct appeal in this case:

United States v. *Crescent Amusement Co.*, 323 U. S. 173;
Interstate Circuit, Inc. v. *United States*, 306 U. S. 208;
United States v. *Amerian Tobacco Co.*, 221 U. S. 106.

STATUTE INVOLVED.

The pertinent provisions of Sections 1, 2 and 4 of the Act of July 2, 1890, 26 Stat. 209, as amended, 15 U. S. C. 1, 2 and 4, commonly known as the Sherman Act, are as follows:

> SEC. 1. Every contract, combination in the form of trust or otherwise, or conspiracy in restraint of trade or commerce among the several States, or with foreign nations, is hereby declared to be illegal. * * *. Every person who shall make any contract or engage in any combination or conspiracy hereby declared to be illegal shall be deemed guilty of a misdemeanor, * * *.
>
> SEC. 2. Every person who shall monopolize or attempt to monopolize, or combine or conspire with any other person or persons, to monopolize any part of the trade or commerce among the several States, or with foreign nations, shall be deemed guilty of a misdemeanor, * * *.

SEC. 4. The several district courts of the United States are hereby invested with jurisdiction to prevent and restrain violations of this act; and it shall be the duty of the several district attorneys of the United States, in their respective districts, under the direction of the Attorney-General, to institute proceedings in equity to prevent and restrain such violations. * * *

THE ISSUES AND THE RULING BELOW

The complaint filed by the United States in this case charges National Lead Company, Titan Company, Inc., and E. I. du Pont de Nemours and Company (hereinafter respectively referred to as National Lead, Titan and du Pont) with being engaged in a combination and conspiracy to restrain and to monopolize interstate and foreign commerce in the titanium pigment industry.

After trial of the case the district court filed an opinion stating that National Lead had been a party to a world-wide patent pool of all present and future patents of the parties; that these agreements covered an entire industry and divided the world into exclusive marketing territories for the various parties with respect to commodities both protected and not protected by patents; and that the agreements had the purpose and effect of suppressing imports into and exports from the United States. The court held that the agreements were unlawful under the Sherman Act and that du Pont had become a

member of the combination with foreign concerns. The opinion states that the effect of the agreement between National Lead and du Pont to exchange all of their present and future patents and patent applications, and to exchange technical information, had been to confront any newcomer in the industry with a veritable jungle of patent claims and that the patents, "through the agreements in which they are enmeshed and the manner in which they have been used, have, in fact, been forged into instruments of domination of an entire industry." This exchange, the court held, was used and was available for use as an instrument of restraint to continue the mastery of the market which National Lead and du Pont had achieved by means of the illegal international agreements. The opinion further states that the net effect of the agreement between National Lead and du Pont was that "a business, originally founded upon patents which have long since expired, is today less accessible to free enterprise than when it was first launched."

The court declared that the plaintiff was entitled to a decree which would restore titanium to a system of free competition and would destroy the means of preventing, and the power to prevent, this development.

The findings of fact filed by the district court show, among other things, the following:

National Lead and du Pont together manufacture 100% of all of the composite titanium pigments, and approximately 90% of the pure titanium pigments, manufactured in the United States. The only other companies producing pure titanium pigments in the United States held licenses to use du Pont's titanium pigment patents. These licenses restricted the amount of pure titanium which could be produced under the du Pont patents and only after the present suit had been started were the restrictions on output cancelled by mutual consent of the parties. National Lead and du Pont had pooled all of their titanium pigment patents and patent applications on a royalty-free basis. Du Pont enjoyed the patents of the foreign associates of National Lead and the latter enjoyed the use of du Pont patents on a royalty-free basis. National Lead and du Pont had also exchanged technical information relating to the industry until May 1940, by which time the titanium pigment business had become a mature industry. National Lead and du Pont had secured a monopoly on technical information relating to the manufacture and use of titanium pigments and they dominated and controlled the manufacture and sale of such pigments to the exclusion of all actual or potential competition in the United States. There were no imports of such pigments into the United States from the foreign co-conspirators and no exports by the defendants into

the territories of the foreign co-conspirators except upon their request.

The decree entered by the district court cancels the agreements made by the defendants which the court had found to be illegal and enjoins them from entering into similar agreements in the future; requires National Lead and Titan to present within a year a plan for divesting themselves of their interests in foreign manufacturers of titanium pigments; and requires each defendant to grant to any applicant a license under all of its titanium pigment patents presently owned or issued within five years from the decree, at a uniform, reasonable royalty. The last requirement is subject to the condition that the applicant grant reciprocal rights under its patents. The decree further provides that, during a period of three years from its date, such license or reciprocal license may, at the option of either party, provide that the licensor shall furnish the licensee, at a reasonable charge, technical information relating to the methods and processes used by the licensor in the commercial practice of the licensed patents.

The Government has assigned as error the failure of the district court—

(a) to require each defendant to license its existing titanium pigment patents without royalty until the district court shall have determined, on application by any defendant, that the effects of

the defendants' illegal combination have been fully dissipated;

(b) to require National Lead and du Pont each to submit a plan providing for the divestiture of approximately one-half of the plant and assets used by it in the titanium pigment business;

(c) to require National Lead and du Pont to furnish to any applicant, at a reasonable charge, technical information relating to the manufacture of titanium pigments, without confining this requirement to methods and processes used in a licensed patent and without making the furnishing of reciprocal information by the applicant a condition of this requirement.

THE QUESTIONS ARE SUBSTANTIAL

The basic question presented on this appeal is whether the decree which has been entered gives the relief necessary to undo the effects of a combination under which the defendants have prevented any substantial competition from others and have attained a position of dominance in the titanium pigment industry. The Government's contention is that the provisions of the decree are insufficient to bring to an end the defendants' dominance in the industry and to give the relief which the district court said in its opinion the decree should provide—"restore titanium to the system of free competition". There is thus presented the question whether this Court should modify the decree "lest the public interest not be ade-

quately protected by the decree as cast." *United States* v. *Crescent Amusement Co.*, 323 U. S. 173, 186.

For years the defendants have had the benefit of an exchange of patents among themselves, and with their foreign associates, on a royalty-free basis. The defendants should be required to extend to others the privilege of royalty-free licensing until the effects of their illegal combination have been fully dissipated. This, and other relief, is essential in order to enable newcomers in the industry, or the two small producers presently licensed by du Pont, to meet the advantages given the defendants by reason of their trade connections, customer position, trained personnel, patents and technical information, achieved under noncompetitive conditions which have led to a duopoly in the industry.

The proposed relief is not in conflict with the ruling in *Hartford-Empire Co.* v. *United States*, 323 U. S. 386, which set aside a requirement for royalty-free licensing for the life of the defendants' patents, upon the ground that this requirement amounted to a confiscation of the patents and constituted the imposition, in an equity proceeding, of a penalty for past violation of the statute. The proposed relief would carry out the principles applied in the decisions holding that, where a patent has been licensed upon conditions or agreements which are beyond the scope of the patent

monopoly and have the effect of restraining competition, the courts will not entertain suit for infringement of the misused patent until the effects of its improper use have been fully dissipated. *Morton Salt Co.* v. *Suppiger Co.*, 304 U. S. 488, 493; *B. B. Chemical Co.* v. *Ellis*, 314 U. S. 495, 498.

The provisions of the decree relating to furnishing technical information are also, in the Government's view fatally deficient. The court's opinion states that the basic patents in this industry have expired. The decree, by providing for furnishing technical information only as to methods and processes employed in licensed patents, does not reach the fund of technical information accumulated by the defendants over the years in which they were exchanging such information. The evidence shows the great importance which the defendants attached to this exchange. The decree should provide for furnishing such information to others at a reasonable charge if it is to afford them reasonable opportunity to compete effectively.

The decisions of this Court establish that partial dissolution may be, and frequently is, a necessary means of destroying the effects of a combination which has captured a substantial part of the market for a commodity, by integrating competitors under single ownership or control. The present appeal raises the novel and

important question of the power of a court, in a Sherman Act proceeding, to require partial divestiture where two corporations, not under common control, have attained dominance in the industry by means of agreements in illegal restraint of trade.

National Lead and du Pont each has two separate major operating titanium pigment plants. One of National Lead's is located on the East Coast and one at St. Louis. Those of du Pont are located in Maryland and New Jersey. The Government therefore believes that it is entirely feasible for each of these defendants to transfer one of its plants to a new corporation and to sell the stock of such corporation to persons not connected with the present combination. But in any event the Government merely requests that the decree require each of these defendants to present, within a stated time, a plan for such partial divestiture of its assets. The objective sought is bringing about a situation in which there would be at least four corporations in the industry of comparable productive capacity.

We believe that the questions presented by this appeal are substantial and that they are of public importance.

Respectfully submitted.

J. Howard McGrath,
J. Howard McGrath,
Solicitor General.

RIFKIND, *D. J.*

By its complaint the United States alleges a cause of action under sections 1 and 2 of the Sherman Act. 26 Stat. 209, 15 U. S. C. A. §§ 1, 2. Its prayer is for an injunction to restrain the alleged violations of the statute and for ancillary remedies to make the court's mandate effective.

The defendants are National Lead Company and E. I. du Pont de Nemours & Company, Inc.,[1] the two principal producers of titanium pigments in the United States and the two largest producers thereof in the world; and Titan Company, Inc., wholly owned by NL and in turn the owner of substantial stock interests in the following corporations, producers of, dealers in titanium pigments: BTP, TG, SIT, TAS and TK.

The complaint charges that

> "Beginning on or about July 30, 1920, defendant National and co-conspirator Titan A/S, and the remaining defendants and co-conspirators, and others to plaintiff unknown, on various dates thereafter, continuing at all times thereafter to the date of the filing of this complaint [June 24, 1944], have been continuously engaged in a combination by the means and methods hereinafter set forth, in restraint of, and to monopolize, the aforesaid trade and commerce in titanium compounds among the several states of the United States and with foreign nations and have been and are now parties to contracts, agreements, and understandings in restraint of such trade and commerce, all in violation of Sections 1 and 2"

of the Sherman Act.

The evidence supports the allegation in every material respect.

Titanium is a very abundant element. The principal ores which yield titanium in commercial concentration are ilmenite and rutile. Titanium compounds and particularly titanium dioxide possess the characteristics of opacity, great hiding power, high tinting strength and chemical inertness. These properties make it superlatively suitable for the manufacture of white paint and valuable in the production of rubber, glass, paper and several additional materials.

The commercial development of titanium compounds is founded largely upon the work of three groups of chemists working independently at and about the time of the first World War. In the United States, at Niagara Falls, New York, Messrs. Barton and Rossi developed a process for the manufacture of titanium compounds. Patents were issued to them; and these they assigned to TP, a corporation formed for the purpose. In Norway, Gustav Jebsen and his associates, interested in the utilization of a large ilmenite deposit, developed another process. The patents which were granted thereon were assigned to TAS, organized for the purpose of exploiting them.

In France, Joseph Blumenfeld invented and procured patents for a third process. Terres Rares acquired these patents.

In 1920 NL held 10% of the stock of TP and had an option to acquire up to 50% of its stock. NL thereupon negotiated an agreement with TAS which was executed and went into effect on July 30, 1920. This agreement became the basic charter for the world-wide regulation of production and commerce in titanium compounds.

It marked the birth of a new industry. In the course of the ensuing twenty years titanium pigments outstripped the production and sale of lithopone and white lead. In the

United States production rapidly mounted and by 1940 more than 100,000 tons of pure TiO_2, having a value in excess of $40,000,000 were manufactured and sold. In Europe and other parts of the world, too, the industry took serious hold and production mounted to approximately one third of the United States tonnage. By 1944 American production had risen to 133,000 tons of pure TiO_2. Most of the sales were not in the form of pure TiO_2 but in the form of extended pigments—that is, pigments composed of TiO_2 chemically united or mechanically mixed with other ingredients.

Throughout this period prices were repeatedly reduced and only once, in 1941, increased.

At or about the time of the outbreak of World War II [this point of time is taken arbitrarily] we find this industry predominantly occupied in the United States by two producers, NL and DP, who supplied, in 1939, 73,645 tons out of a total of 82,940 tons. The balance of 9,295 tons is produced by American Zirconium, a licensee of both NL and DP and by Virginia Chemical, a licensee of DP[2]. We further find a complete absence of imports of titanium products from abroad, and complete absence of exports from the United States, except to the countries of the Western Hemisphere.

In order to understand how this condition of affairs came to be, it is necessary to review the provisions of the mentioned contract of 1920 and briefly to relate the history of the persistence of its principles in more than 60 agreements subsequently executed.

The 1920 agreement between TP and TAS provided:

The preamble recited that each of the parties owned and expected to own certain patents and that each desired to

obtain rights under the patents owned by the other, within the "licensed field".

"Licensed field" was defined to include all substances consisting of or containing above two per cent. of titanium, or a compound or compounds thereof, unless such substances contained by weight more than five per cent. of a metal other than titanium in its purely metallic state, and all apparatus, methods, and processes useful in the obtainment or manufacture or use of said substances.

TP agreed to grant to TAS and TAS accepted a license, exclusive of all others including TP, to manufacture, use, and sell each and every invention improvement, or subject matter in the licensed field, under existing or future letters patent; but only in or for territories outside of North America and South America.

TAS agreed to grant to TP and TP accepted a license, exclusive of all others, including TAS, identical in scope and extent except that it was limited to and for the territories within North America (defined to include Central America and Panama).

Each party granted the other a non-exclusive license to use or sell, under patents issued by South American countries, but only in South America.

The parties agreed to make available to each other copies of patent applications; and detailed provision was made for the prosecution of patent applications and the maintenance of patents within the territory of each party respectively.

Each party agreed never to question the validity of the patents of the other.

TAS appointed TP its sole agent for the introduction into and sale in North America of *all products of TAS in*

the licensed field. Such importation into the United States could take place only upon the order of the agent; and the sales in North America were to be made at prices and upon conditions fixed by the agent.

TP similarly appointed TAS its sole agent for introduction and sale, outside of North and South American of all TP products in the licensed field.

Each party was permitted to import into the territory of the other finished articles, such as point, glass, rubber, in which a titanium product had been used as a raw material—but only when the titanium product did not constitute such an important part of the finished article that its sale would substantially interfere with sales of its own products by the other party within its own territory.

Each party agreed to impart to the other full and accurate technological information relating to the licensed field, and to permit plant inspection (exclusive of research laboratories).

Article XIV of the agreement conferred upon each party the right to grant licenses under its own patents or sublicenses under the other's patents, on condition that every such licensee or sublicensee would

a) grant to the party to the 1920 agreement, other than its licensor, exclusive licenses under all its patents, present and future, in the licensed field, identical in character, territorial scope, and duration to the rights granted by the 1920 agreement by the parties thereto;

b) appoint such other party its sole agent on the same terms as obtained between the parties to the 1920 agreement;

c) would impart to such other party technological information to the same extent as obtained between the parties to the 1920 agreement;

d) would abide by the territorial allocation of the 1920 agreement.

The agreement of 1920 was to continue in effect until 1936, and was then to be automatically renewed for successive ten year periods, each party having the right to cause a termination by notice given at least five years before the end of such period.

By an agreement executed simultaneously with TP and TAS, NL bound itself to respect the contract of 1920, promptly to assign to TP all its then owned or thereafter acquired patents, inventions and improvements relating to the licensed field, throughout the world, and to communicate to TP all its technical information in the licensed field.

It is manifest that by the terms of this agreement the parties had divided the world into two trade areas or territories; that each party agreed not to trespass into the territory allotted to the other; and that all commerce between the two territories in titanium products was, as far as these parties were concerned, interdicted and could proceed only by the grace of their mutual consent. The suppression of this commerce was not limited to patented articles or to articles produced by patented processes but extended to all products within the "licensed field".

The objects of this arrangement have not been left unstated, to be ascertained by inference and deduction. They are disclosed by a large volume of written correspondence, unhibited by any respect for, or indeed any apparent awareness of the prohibitions of the anti-trust laws.

These explicitly stated objects are: 1, the elimination of competition; 2, the advancement of the art through the exchange of technology. It was the belief of the architects of this foundation of the industrial structure they hoped to build thereon, that the second object could not be attained except in a climate of cooperation engendered by the achievement of the first object. And it was their intention that the advance in the art, accelerated by the exchange of patents, patent applications and "know how", should as far as possible remain the private prize of the parties, and constitute their shield and weapon against outsiders.

This intention was carried into effect.

An examination of the evidence reveals the perpetuation of what the parties called the principles of the 1920 contract by a network of agreements which have confined the international trade in titanium products within the preordained channels where-through it moves only by the grace and under the regulation of NL and its foreign associates. It is unnecessary to rehearse the history and detail of that development. Both are recited in the Findings of Fact. A very brief summarization is all that will be attempted here.

In 1927 NL acquired 87% of the stock of TAS. Jebsen retained 13%.

In 1929 NL organized Tinc, which thereupon acquired the rights and assumed the liabilities of TAS under the 1920 Contract. Tinc became NL's corporate pocket for the deposit of its holdings in foreign titanium enterprises. By 1932 NL had acquired all of the stock of TP and in 1936 it acquired all its assets and assumed its obligations.

On May 1, 1925, by agreement between TAS and French interests, SIT, a French corporation, was estab-

lished to manufacture and distribute titanium products but only within the territory of France and its colonies (except those appurtenant to North and South America). Both TAS and NL acquired substantial interests in SIT. On March 3, 1927, the arrangements between TAS and SIT were confirmed and elaborated to give explicit expression to the provisions of the 1920 Contract relating to territory, competition and technological collaboration.

In 1927, by agreement between TAS (acting also in behalf of and in the interest of NL) and IG, a German corporation was established, called TG. IG and TAS became the joint owners of TG. IG agreed that it would not engage in the titanium business except through TG, to whom it assigned all its titanium patents and to whom it agreed to assign all its future titanium patents. To TG was assigned a territory consisting of Germany, Russia, Austria, Hungary, Czechoslavakia, Switzerland, Roumania, Serbia, Croatia, Slovenia, Bulgaria, Greece, Turkey, Japan, China, and Spain. TAS and TG simultaneously entered into an agreement which embodied the principles of the 1920 Contract.

NL was in good part motivated in bringing about these German agreements by the desire to be free of the potentially very dangerous competition of so powerful a producer as IG. The evidence is incapable of any other inference.

By 1933 NL was acting in the foreign field through Tinc. By a series of agreements entered into in February and March, 1933, production and distribution of titanium products within the British Empire (exclusive of North and South America) were brought within the orbit and subjected to the regulation of the principles of the 1920 Con-

tract. The agreements were among Tinc, JCI, ISC and GW. Pursuant to these agreements BTP was formed and became the assignee and licensee of existing and future titanium patents of the parties to the agreement; it also became subject to and beneficiary of the principles of exclusive territorial allocation and patent and technological collaboration of the 1920 Contract.

Meanwhile, significant events were taking place within the sphere of relations between the producers already mentioned and other producers, both American and foreign, whose processes stemmed from the inventions of Joseph Blumenfeld. But I shall depart from the chronological order in order to complete the recitation of events pertinent to the producers whose processes were rooted in the Jebsen-Barton and Rossi inventions.

Canada was NL's territory under the 1920 Contract. But danger of independent competition in that market developed from the plans of Laporte. In 1937, NL and CIL entered into agreements for the formation of CTP, to whom Canada was assigned as its exclusive territory. CTP became the beneficiary of all present and future titanium patents of both its founders. It was subjected to the restrictions and given the benefits of the principles of the 1920 Contract. The threat of Laporte's competition was eliminated by an agreement under which Laporte's Canadian business and patents were purchased and Laporte covenanted to stay out of the titanium business in Canada for 15 years.

In 1936, Tinc, IG and TG, a Blumenfeld company, TR and a Japanese company, KK, joined in the formation of TK to engage in the manufacture and sale of titanium products. The territory assigned to TK was the Japanese

Empire. This agreement departed in some respects from the principles of the 1920 Contract but it adhered strictly to the principles of exclusive territorial allocation and the elimination of competition between territories. In the new Japanese company ownership was divided as follows: 50% to KK; of the remaining 50%, TR got 30% and Tinc and IG 70%. This division of interest between Tinc and IG on one side and the Blumenfeld companies on the other was dictated by agreements previously entered into which need now to be briefly mentioned.

It has already been stated that Joseph Blumenfeld had assigned his titanium patents to TR. TR in turn assigned or licensed them to Aussig of Czechoslovakia, Montecatini of Italy, Thann of France, Laporte of Great Britain and Commercial Pigments of the United States, who severally were engaged in the production of titanium products and exploited various markets in competition with the producers, already mentioned, who utilized the Barton-Rossi and Jebsen processes. Beginning in 1933, a series of agreements were negotiated and executed, the object of which was to bring this competition under the control of the parties.

i. The first of these was the Aussig agreement, made in 1933, by TG and Aussig. This agreement regulated production, territory of sale, sales quotas, prices and patent exchange.

ii. The Contrat a Quatre was executed in 1935 to take effect as of May 1, 1934. The parties were Thann and TR on one hand, and SIT and Tinc on the other. It regulated sales quotas, prices and patent exchange.

iii. The Contrat de Livraisons was executed in 1935 by the same parties. To prevent the expansion of

producing capacity, the contract provided that each would supply the other with its surplus product to satisfy the other's deficiency.

iv. The Contrat a Six was executed at the same time. The parties were Thann, TR, Montecatini, Tinc, SIT, and TG. It regulated sales-territories and sales-quotas of each of the parties. All the parties agreed to give neither technical nor commercial assistance or assign any patent or grant any license to any outsider who intruded into the territories covered by the agreement. This agreement was renounced by Montecatini on December 31, 1938.

v. The British Empire was not embraced within the forementioned agreements. Sometime in 1936, BTP and Laporte entered into agreements whereby Laporte withdrew from the world market outside the British Empire and uniform prices were established in the British market. In 1941, BTP and Laporte entered into a quota arrangement with Laporte, establishing 80% as BTP's share and 20% as Laporte's share of the British market.

I return now to the United States and take up the thread of the story in 1931. Since this aspect of the case will require more detailed analysis, I shall but sketch its outlines to serve as a frame of reference for the discussion which is to follow. As already indicated, Commercial Pigments held the American rights under the Blumenfeld patents. Until 1931, the company engaged in manufacturing and selling pure TiO_2. In 1931, these rights were acquired by Krebs, a corporation organized by DP and Commercial Solvents Corporation. DP acquired 70% of the stock of Krebs.

Krebs manufactured and sold titanium compounds until 1935, when DP acquired all its assets. Thereafter and to date, DP engaged directly in manufacture of titanium compounds. After a protracted period of negotiation between NL and DP, their respective titanium subsidiaries TP and Krebs, entered into a written agreement, dated January 1, 1933, which was executed in July of 1933. By the terms of this agreement they

i. exchanged irrevocable, non exclusive licenses, within the United States, to use all processes, methods, and apparatus relating to or in the "licensed field"[3], whether or not patented or subject to patent, then or thereafter owned by them or otherwise at their disposal, with the right to sell products resulting from the exercise of such licenses in the United States, its colonies and possessions, Mexico, Central America, the West Indies and South America;

ii. agreed to exchange technical information and experience;

iii. agreed to assist each other to acquire an irrevocable, non-exclusive license, for the territory above described, under any patent or application owned by or otherwise at the disposal of third parties, under which one of them was itself licensed; and Krebs agreed that it would offer to any foreign associate of TP, before offering to any other person, the opportunity to acquire, upon mutually satisfactory terms, an irrevocable, non-exclusive license under any patent, then or thereafter owned or at the disposal of Krebs, relating to the "licensed field", issued in any country of Europe or in Great Britain;

iv. released each other from infringement claims;

v. agreed that the agreement might be terminated after December 31, 1933, on three years notice.

Before this agreement was executed there was an exchange of oral and written communications between NL and DP, of which more will be said hereafter. It is sufficient to indicate at this point that the DP agreement departed in several important respects from the requirements of Art. XIV of the 1920 Contract.

In each of the years 1937 to 1941, inclusive, DP and Tinc entered into agreements whereby DP granted to Tinc licenses, exclusive except as to DP, under specified titanium patents and applications of DP, in specified countries, with the right to grant sublicenses to TG, BTP, SIT and from 1939, to TK; and Tinc, with the consent of NL, granted DP non-exclusive licenses under specified United States patents and applications.

On or about May 1, 1940, the exchange of technical information between NL and DP was discontinued; and by agreement of January 1, 1941, the 1933 agreement was amended accordingly.

As already noted, there are in the United States only two other producers of titanium products, American Zirconium and Virginia Chemical.

American Zirconium began the manufacture of titanium compounds in 1934. NL and DP severally notified American Zirconium that it was probably infringing. On May 6, 1935, NL (through TP) entered into an agreement with American Zirconium for the cross-licensing of patents. The agreement in all material respects embodied the principles of the 1920 Contract. In lieu of royalties NL received 10% of the stock of American Zirconium.

In April, 1944, the agreement was cancelled and NL assigned its American Zirconium stock to the latter's parent corporation.

In July, 1935, DP and American Zirconium entered into an agreement dated January 1, 1935, whereby DP granted American Zirconium a non-exclusive license under specified patents, subject to a royalty on the "total quantity of titanium dioxide produced" and subject to a quantity limitation on the tonnage of "titanium dioxide made wholly or partly under the license". The quantity limitation was graduated from 3,000 tons at the inception of the contract to 9,000 tons in 1944 and thereafter. The limitation was from time to time somewhat relaxed and was cancelled on November 10, 1944, on recommendation of DP's Legal Department.

Virginia Chemical received a license from DP on August 5, 1937. Its terms were substantially similar to those of the American Zirconium license.[4] The quantity limitations were eliminated at the same time and under the same circumstances as the corresponding change was made in the license to American Zirconium.

This concludes the barest outline of the history of the titanium industry. In detail, the elapsed quarter century is crowded with negotiations, conferences, correspondence and agreements. The men who participated in these were all articulate, literate and, with the exception of DP's Ruprecht, recorded what they saw, heard, said and thought with Boswellian fidelity. When the story is seen as a whole, there is no blinking the fact that there is no free commerce in titanium. Every pound of it is trammelled by privately imposed regulation. The channels of this commerce have not been formed by the winds and currents of competition.

They are, in large measure, artificial canals privately constructed. The borders of the private domain in titanium are guarded by hundreds of patents, procured without opposition, and maintained without litigation. The accumulated power of this private empire, at the outbreak of World War II, was tremendous. It was more difficult for the independent outside to enter this business than for the camel to make its proverbial passage through the eye of a needle.

For the purpose of the discussion which follows, it is convenient to segregate DP's relations with NL and the foreign producers from NL's relations with the foreign producers.

I. The case against NL and Tinc.

At the outbreak of World War II we find that NL and Tinc are, by virtue of agreement, members of a world-wide combination. The more intimate members of that combination are NL, Tinc, TAS, SIT, TG, BTP, TK and CTP. Among these, the closest cooperation prevails. Territories are allocated; patents and patent applications are interchanged and cross licensed; technological information or "know-how" of one is promptly made available to the others (except TK). Each operates in its own exclusive territory. When there is suspicion that a customer of one is shipping into the territory of another, investigation is promptly made with a view to suppressing the "illicit" traffic. Competition among them is non-existent.

A less intimate bond unites the members of this Titan family with the Blumenfeld group. No member of the latter group exports into NL's exclusive territory. NL does not export outside of the Western Hemisphere. For

the territory beyond NL's frontiers, quota arrangements and price agreements assure the absence of competition between the Titan family and the Blumenfeld group. In Japan both groups unite in a common enterprise.

And all this is the product of agreements.

Clearly this combination affects the interstate and foreign commerce of the United States. No titanium pigments enter the United States except with the consent of NL. No foreign titanium pigments move in interstate commerce except with like approval. No titanium pigment produced by NL may leave the ports of the United States for points outside the Western Hemisphere.

One of the objects of the combination is to suppress competition.

On January 12, 1927, the president of NL writes to Evans McCarty, its vice-president, and one of the chief architects of the combination:

> "The titanium patents expire in 1936 unless extended in ways not at present known to us. . . . Therefore, with us in the United States and with the Norwegian Company, there is a common need to exploit titanium pigments and, at the same time, protect ourselves; so that after the expiration of patent rights, we may have the manufacture and sale thereof under our control so as to continue to reap the harvest from the seed we are now sowing. If you, therefore, could formulate a plan satisfactory to Dr. Jebsen, whereby we could arrange to pay a royalty to the Norwegian Company similar to that he proposed to ask from the German Company, under an agreement that the National Lead Company would endeavor to organize companies in Germany, England and such other European countries as it

> desired—in each of which companies the National Lead Company should acquire and own at least one-half of the capital stock outstanding—I would personally look with favor upon such an arrangement". (Pl. Ex. 70).

On April 27, 1932, Jebsen writes to Major Barley, of Imperial Chemical Industries, Ltd., proposing the formation of a British company in keeping with the suggestion of NL's president. Therein he refers to the 1920 Contract and adds:

> "In order to avoid competition and friction, it was agreed that each company should confine its activity of manufacture and sales to a definite territory". (Pl. Ex. 112).

Prior thereto, on September 16, 1930, Jebsen reported to McCarty concerning the early conversations with Aussig:

> "I presented for discussion your suggestion of a pooling of the patents. It is not quite clear to me what is meant by this. We thought, however, that the idea was mutual cooperation and possible joint action to keep third parties out", (Pl. Ex. 522).

He pointed out a number of obstacles in the path of such a scheme—but these were in fact overcome.

In April, 1931, Cornish, president of NL, finds himself obliged to contribute to the correspondence by reason of McCarty's illness. The subject under discussion is apparently the proposed arrangement with the Blumenfeld companies:

> "May I call the proposed combination, for simplicity, a cartel?"

And he defines it.

> "The whole purpose of the cartel is to obtain a monopoly of patents so that no one can manufacture it excepting the members of the cartel, and so can raise the prices by reason of such monopoly to a point that would give us much more profit on our present tonnage, but also prevent a growth in tonnage that would interfere with their greater profits in lithopone". (Pl. Ex. 183).

He voices objections based on business, not legal, grounds. His objections, however, were apparently not pressed.

Such was the purpose for which, and such were the means by which, NL, McCarty and Jebsen built their closed system. To have access to the patents of the combination, the stranger must not only have the consent of the member of the combination in whose "territory" he would operate, but he must adhere to the principles of the combination. The cornerstone of the system was the private regulation of international trade. The suppression of competition was the cement which held the superstructure in place.

Whether the form of association they created be called a cartel, an international cartel, a patent pool, or "a technical and commercial cooperation", is of little significance. It is a combination and conspiracy in restraint of trade; and the restraint is unreasonable. As such it is outlawed by Section 1 of the Sherman Act; and it is unimportant whether it also violates Section 2.

No citation of authority is any longer necessary to support the proposition that a combination of competitors, which by agreement divides the world into exclusive trade areas, and suppresses all competition among the members

of the combination, offends the Sherman Act. Hence we need only consider the adequacy of the defenses asserted against the case established by the plaintiff.

The system of territorial allocation and suppression of trans-Atlantic traffic in titanium compounds and pigments cannot be justified as ancillary to the grant of a license under a patent. True, the network of agreements did involve cross-licensing of patents—but it was not limited thereto. The agreements applied to patents not yet issued and to inventions not yet imagined. They applied to commerce beyond the scope of any patents. They extended to a time beyond the duration of any then-existing patent.

Ethyl Gasoline Corp. v. *U. S.*, 1940, 309 U. S. 436, 456.

They embraced acknowledgement of patent validity with respect to patents not yet issued, nor applied for, and concerning inventions not yet conceived,

Pope Mfg. Co. v. *Gormully*, 1892, 144 U. S. 224;

U. S. v. *Hartford-Empire Co.*, N. D. Ohio, 1942, 46 Fed. Supp. 541, 615.

They extended to countries, such as China, where no system of patent monopolies exists.

Interstate Circuit, Inc. v. *U. S.*, 1939, 306 U. S. 208.

They regulated the disposition of the products after sale by the licensees,

U. S. v. *Univis Lens Co.*, 1942, 316 U. S. 241;

U. S. v. *Bausch and Lomb Optical Co.*, 1944, 321 U. S. 707.

While it has been held that the owner of a patent may license whom he will or refuse to license;

Continental Paper Bag Co. v. *Eastern Paper Bag Co.*, 1908, 210 U. S. 405,

it is now well settled that a license may not be used to extend the patent monopoly beyond its terms,

Morton Salt Co. v. *Suppiger Co.*, 1942, 314 U. S. 488;

Ethyl Gasoline Corp. v. *U. S.*, supra, 456.

And where there is a refusal to license (or refusal to license except on specified conditions which would extend the patent monopoly) which is the product of agreement or conspiracy, on part of the owners of competing patents, I believe, the law is offended to the same extent as the law is violated when several combine and agree not to do business with a particular customer or class of customers,

U. S. v. *Colgate & Co.*, 1919, 250 U. S. 300;

U. S. v. *A. Schrader's Sons, Inc.*, 1920, 252 U. S. 85;

U. S. v. *Waltham Watch Co.*, S. D. N. Y. 1942, 47 Fed. Supp. 524, 531.

The agreements here involved offend in that respect, as well.

It is suggested that the 1920 Contract may escape the condemnation of the Sherman Act by recourse to the doctrine which validates covenants in restraint of trade when reasonably ancillary to a lawful principal purpose, such as the sale of a business;

U. S. v. *Addyston Pipe and Steel Co.*, C. C. A. 6, 1898, 85 Fed. 271, affd. 175 U. S. 211.

Such a principal purpose is, in the case at bar, supposed to be the sale by TAS of its American business to TP, accompanied by a license under its patents; and conversely, the sale by TP of its foreign business to TAS, accompanied by a license under its patents.

The shortest answer to this suggestion is that, in fact, TAS had no American business to sell, and that TP had no foreign business to dispose of. At best, each had an opportunity and a hope. Certainly the world-wide territorial allocation was unreasonable in scope when measured against the business actualities. This is a case where if not the sole, at least one of the principal objects was "to restrain trade in order to avoid the competition which it has always been the policy of the common law to foster",

U. S. v. Addyston Pipe and Steel Co., 1898, 85 Fed. 271, 282;

Greater New York Live Poultry Co. of C. v. U. S., C. C. A. 2, 1931, 47 Fed. 2d 156, cert. den. 283 U. S. 837.

In each of the subsequent agreements which resulted in the creation of SIT, TG, BTP, CTP and TK, the same purpose, to restrain trade in order to avoid competition, was paramount.

It is suggested that this Court is without jurisdiction to consider conduct abroad, on part of foreign corporations, relating to the commerce of foreign nations. Unquestionably, if the gravamen of the complaint were to impeach the Aussig agreement as such, or the BTP-Laporte quota arrangement as such, the point would be well taken. But that is not the gist of the complaint. On the contrary, it has been alleged and proved that a conspiracy was entered into, in the United States, to restrain and control the com-

merce of the world, including the foreign commerce of the United States. The several agreements relating to manufacture and trade within the European markets are but some of the links in the chain which was designed to enthral the entire commerce in titanium. The object of the government's attack is a conspiracy in the United States affecting American commerce, by acts done in the United States as well as abroad. It follows that the Sisal case[6] rather than the Banana[7] case is the pertinent analogue.

The argument has been advanced that this court cannot invalidate contracts with parties who are not within the court's jurisdiction and amenable to its order.[8]

The absence of NL's foreign associates will, of course, place a practical limitation upon the scope of the court's decree; it does not prevent the court from finding a violation as the facts warrant, and from restraining those within the reach of its mandate from continuing a conspiracy in defiance of the Sherman Act.

It is suggested that plaintiff has failed to establish injury to the public interest,

Appalachian Coals, Inc. v. *U. S.*, 1933, 286 U. S. 344;

and that the defendants have proved substantial public benefit.[9] The latter proposition, defendants derive from two lines of evidence. The first is that during the regime of the combination, the art has rapidly advanced, production has increased enormously and prices have sharply declined. The evidence does show as much; but it does not follow that the public interest has not been abused. Indeed, the major premise of the Sherman Act is that the suppression of competition in international trade is in and of itself a public injury; or at any rate, that such suppression is a greater

price than we want to pay for the benefits it sometimes secures. Nor does it necessarily follow that the advance of the art, the rise in production and the decline of prices are attributable to the effects of the combination. *Post hoc, propter hoc,* is an invalid argument whether used by the plaintiff or the defendant. Anyone is free to speculate whether, in the absence of the arrangement, the stimulus of competition might not have produced far greater strides in these beneficial directions. The economic theory underlying the Sherman Act is that, in the long run, competition is a more effective prod to production and a more trustworthy regulator of prices than even an enlightened combination.

The second line of evidence is that American producers cannot do business successfully in a cartelized world except on cartel terms; and that, to abstain from such business, would amount to a greater restraint on trade than is involved in joining the cartel; see,

> Cartels: What Shall We Do About Them? Milo Perkins, Harper's Magazine, November, 1944.

The validity of this argument has been the subject of congressional inquiry: Temporary National Economic Committee, 76th Congress, Monograph No. 40; Economic and Political Aspects of International Cartels, Committee on Military Affairs, U. S. Senate, 78th Congress, 2d Session. That kind of inquiry, rather than a judicial one, is appropriate to the evaluation of the merits of the proposition. For the courts it is conclusive that Congress has not yet validated such a solution to the problem. Until it does, private agreement and combination and private regulation may not substitute for legislation. Only Congress, not the courts, may grant the required immunity.

It is suggested that the truly vital issues of this case have become moot by the intervention of war with Germany, Japan and Italy; and that the complaint should be dismissed. Reliance is placed upon *U. S.* v. *Hamburg-Amerikanische Packetfahrt A.G.*, 1916, 239 U. S. 466. Several reasons dictate the rejection of this argument.

(1) The Hamburg case rests upon its own peculiar facts. The offending contract had come to an end by its own terms; as far as the Germans were concerned, it had also terminated by reason of war; and as far as the others were concerned, by the withdrawal of the Germans;

> *U. S.* v. *Aluminum Company of America*, C.C.A. 2, March 12, 1945, slip opinion, p. 1256.
>
> "Besides, the contract was of such a kind that the exclusion of the German lines probably made impossible the realization of its purposes in any part;" ibid.

In the instant case, the contracts with the Germans had not expired by their terms; and, at least to the moment of America's entry into the war, the parties did not intend or expect that war should or would involve a permanent divorce.

(2) This case abounds with evidence that the parties foresaw the possibility of interruption *causa belli* and made provision for dealing with the interlude and for resumption thereafter. At least this can be said with complete assurance that until the entry of the United States into the war, the contracting parties regarded the war as a tempo-

rary interruption, for which they would, after cessation of hostilities, make adjustments in a spirit of fairness and amity.

Peculiarly revelatory in this connection is plaintiff's Exhibit 512. It is the draft of a letter preserved in the files of Tinc, entitled, "Draft of letter from Titan Co., Inc. to be sent later, presumably after the war, to: I. G. Farbenindustrie, Titangesellschaft, British Titan Products Company and Ste. Inc. du Titane." The letter reports the amendment of January 1, 1941, to the NL-DP agreement of 1933, explains that war conditions rendered consultation with the addresses impractical and expresses a desire for their approval. When this was written, the United States was not at war; but England, France, Germany, and Italy were at war. One can not read Exhibit 512 without sensing the expectation, indeed the assumption, that the war may have interrupted the execution of the several agreements among the parties, it had not permanently disarranged the relations of the parties, and that the return of peace would bring a resumption of the established "cooperation". Much other evidence points in the same direction; and none of the evidentiary material created *ante litem motam* points in a conflicting direction. Upon the trial in the midst of war, the future resumption of relations with the Germans was emphatically repudiated.

The inference I draw is that there is a preponderant probability that the underlying combination or conspiracy persists and that, but for these proceedings, would resume the exercise of its restraining force on commerce to the extent that international conditions permitted.

(3) That some of the contracts have been terminated by war, it seems to me, is of relatively little significance.

For in a legal sense we mean no more thereby than that the contracts have become unenforcible. But these contracts, being in restraint of trade and violative of the anti-trust laws, were never enforcible. If the non-enforcibility of the contract were to render an action under the anti-trust laws moot, we would face the absurd result that only innocent combinations would remain available for judicial scrutiny.

It is suggested that the validity of the British and Canadian contracts has become moot by the application of the doctrine that cancellation or abandonment of provisions of a contract prior to final decree renders the question of the validity of such provisions moot.

Standard Oil Co. v. *U. S.*, 1931, 283 U. S. 163;
U. S. v. *U. S. Steel Corporation,* 1920, 251 U. S. 417, 445.

It should be noted that the authorities do not justify the statement of the rule in quite such broad terms.

U. S. v. *Trans-Missouri Freight Assn.,* 1897, 166 U. S. 290;
U. S. v. *Sugar Institute, Inc.,* S. D. N. Y. 1934, 15 Fed. Supp. 817, mod. 297 U. S. 553.

Injunctions, of course, relate to future conduct. The formal cancellation of a contract, or of a provision of a contract is a fact to be considered in determining whether, under all the circumstances, the unlawful action of the past is likely to recur in the future; the issue is the likelihood of continuance;

Swift & Co. v. U. S., 1905, 196 U. S. 375, 396.

The facts in the instant case with respect to the British and Canadian contracts are briefly these. At a pretrial conference held in this case on October 30, 1944, counsel for NL called attention to the existence of a new form of contract, then in a state of negotiation between NL and the British companies. At the trial, a copy of such a proposed agreement, not yet executed by the parties, was received in evidence. The named parties were ICI, ISC, GW, Tinc, BTP and NL. Similarly, there was testimony that negotiations were in progress among NL, CIL and CTP to revise the Canadian agreements.

This evidence shows that there is a disposition on part of defendants NL and Tinc to abandon illegal practices; it does not rise to the dignity of proof of abandonment. Nor is it necessary to recite here the precise changes which the parties are willing to introduce into their relations. To my mind these proposed agreements amount to little more than a statement of what defendants are willing to accept. Apparently, execution of the new agreements is awaiting some word of approval by the court. It seems, under the circumstances, that it would be more appropriate to examine them in connection with the framing of a decree, rather than as bearing on the question whether any decree is to be made for injunctive relief.

This branch of the case may be briefly summarized thus:

Agreements creating a world-wide patent pool of all present and future patents of the parties, covering an entire industry, and embracing a division of the world into exclusive territories within which each of the parties is to confine its business activities, with respect to patent protected commodities, as well as unpatented, for the purpose

and with the effect of suppressing imports into and exports from the United States, are unlawful under the Sherman Act; they constitute an unreasonable restraint of trade.

II. DP's part in the international cartel.

As to DP, the facts are by no means as clear. Stoutly it denies any complicity in the combination; and much of the evidence supports its denial. It did not subscribe to the 1920 agreement; the agreement it did sign, in 1933, deviated sharply from the form and from the principles of the 1920 agreement. In 1940, it withdrew from the exchange of technological information with NL. It competed with NL for the American market. It was never regarded by the Titan group as a full fledged member of their family. Its anomalous position was the subject of frequent discussion and apprehension among the Titan members, and efforts were made to convert DP into a fully conforming member.

In sharp contrast with NL DP exhibited, from the very beginning of its interest in titanium, an alert consciousness of the anti-trust laws and moved cautiously and under the guidance of trained anti-trust lawyers. The question is whether it succeeded in avoiding not only the form but also the substance of transgression. I have concluded that it has not; and I arrive at that conclusion by the following analysis of the facts:

DP was manifestly eager to obtain access to NL's patents and skill in the titanium field. NL was equally eager to grant such access. NL's motives for this eagerness are not too important. It matters little whether it sought the reciprocal advantage of DP's patents and re-

search; or whether it feared DP's hostile competition more than it feared its friendly, though competitive, collaboration; or whether it anticipated that NL and DP together would constitute an alliance so formidable as to preclude any other important competition. Whatever its motive, NL was willing; but its liberty of action was sharply circumscribed by the agreement of 1920. That required that, before NL could license DP under its patents, DP must adhere to the principles of the 1920 agreement. Such adherence, DP refused. The reasons assigned by DP for its refusal were several, and varied from time to time, but always conspicuous among them was the claim that its adherence was forbidden by the anti-trust laws.[10] In this troubled atmosphere, the 1933 agreement was drawn, after long negotiation, by lawyers who were aware of the then recent decision in the Gasoline Cracking case. *Standard Oil Co. v. U. S.*, 1931, 283 U. S. 163.

Carefully, they cast the agreement into the form of a settlement of patent disputes. The disturbing fact about that instrument is that despite the high professional skill expended upon it, its terms are, in important respects, so vague that upon the trial, counsel for NL and counsel for DP did not agree upon its meaning. It is clear, and I believe not disputed, that the 1933 writing is far from the lawyer's ideal of clarity and precision. The only explanation which the record affords for this unexpected obscurity is contained in a letter from Mr. Beschorman to NL's English associates, that the vagueness in the writing is deliberate and the product of fear of the anti-trust laws.

That, of course, does not affirmatively show that the law was violated; moreover, it is true that no evidence is available that DP knew of Beschorman's letter. Conse-

quently, I draw no inference therefrom against DP; but I do draw an inference as to NL's frame of mind in its negotiations with DP.

To return to the negotiation: NL was not at liberty to enter into the 1933 agreement unless and until its foreign associates consented. TG objected. It was particularly concerned lest, as a result of this agreement, TG should find itself in competition, in its own "territory", with DP, the latter armed with TG's own skill, acquired by DP, via NL—a state of affairs which TG regarded as intolerable. To overcome the obstacle of TG's objection, conversations were had between Rupprecht, on behalf of DP, with Beschorman, on behalf of NL, and also between Rupprecht and Jebsen; and as a result of these conversations two letters were written, one by DP to NL with the intention that it be transmitted to TG; and the other by NL to TG to accompany DP's letter.

If DP is bound by the second letter, it unquestionably joined the conspiracy then in effect between NL and its foreign associates. The text of the two letters is set out in the margin.[11]

I believe that DP is bound by the second letter because (1) DP asked NL to persuade TG to consent. Rupprecht told Beschorman,

> "that it was a selling job for them [NL] to make I.G. realize that they were putting their interests in National Lead's hands, and that they would be well taken care of"; (Pl. Ex. 268).

(2) Rupprecht was shown the Beschorman letter before it was mailed; and a copy thereof was later sent to him "for your files".[12] There was no repudiation by Rupprecht; or at least, the record shows none; and at this point the

burden of going forward with proof of such repudiation shifted to DP;

Interstate Circuit, Inc. v. U. S., 1939, 306 U. S. 208, 225.

Such quiescence on the part of DP can only be construed as ratification. It follows that the assurance that "Du Pont will loyally respect the territory of T.G." which TG discovered in the communications from Rupprecht and Beschorman was an assurance which must be attributed to DP, despite the painstaking efforts on its part to sever the line of imputation. At least then as to territorial delimitations of the titanium pigment business, DP joined the combination.[18]

U. S. v. *Masonite Corp.*, 1942, 316 U. S. 265.

It may well be, and I take it as a fact, that in giving the assurance not to manfuacture in or sell in TG's territory, DP was not making a promise; it was doing no more than giving expression to its then existing busines policy not to manufacture or sell in Germany and other TG territory; and it may well be that in any event, DP could not successfully compete in Germany. While much has been made of this point, it does not cover the whole issue either factually or legally. Factually it is inadequate, because TG's exclusive territory extended very considerably beyond Germany and included territories where DP might have competed. Legally it is insufficient, because concerted abstinence from commerce is proscribed even where there are valid unilateral reasons for abstaining;[14] and also because DP's assurance, in part, formed the consideration

for the continued abstinence of the European producers from exporting to the United States.

It is idle to speculate as to what might have happened had NL and DP insisted on making their agreement without regard to TG's objections. Presumably, had such an event occurred, TG would have been relieved of its promise not to export to the United States. In a very important way, DP's assurance closed the breach which was in the making in the wall built around the titanium business by NL and its foreign associates. It also removed the last obstacle to the establishment of a commercial collaboration between the Titan group and the Blumenfeld companies. True, Rupprecht did not go as far with Blumenfeld as he did with NL. Not as much was necessary. Indeed, no action on his part was necessary since he sought nothing from Blumenfeld. From the somewhat conflicting testimony as to the nature of Rupprecht's conversations with Blumenfeld, I conclude that Rupprecht made no promise; but that he did explain to Blumenfeld DP's policy with respect to the European market, a policy made unilaterally in many respects, but undoubtedly strengthened and territorially extended as a result of the assurances to NL.

This description of DP's position in 1933 is consistent with subsequent developments. To Jebsen, devotee of the precise covenant, advocate and practitioner of clarity and definition in language and obligation, such vague and Janus-faced language was a source of disquiet and apprehension. But he hoped for the best. He regarded Rupprecht as one who rarely descended from "sound to things". But he appraised DP as an organization that would not repudiate an unwritten obligation. Rupprecht, on the other hand, found the business of practicing one code, and writing another,

rather strenuous and emotionally confusing. No wonder that communication between DP and NL became somewhat difficult; and, at times, NL's and Tinc's representatives left a conference with very different impressions of what had been agreed to from those entertained by Mr. Rupprecht.

The point is made in behalf of DP that there is no evidence that its Executive Committee knew of Rupprecht's commitments. It is true that no direct evidence of such knowledge is in the record, and I need not trouble to decide whether the circumstances warrant an inference of knowledge. There is abundant evidence that Rupprecht's authority was broad enough to justify charging the corporation with his acts in its behalf.

My general summary of the evidence on this issue is that DP was a member of the combination—true, a special member, with a status, rights and obligations, different from that of the other members, but a member nonetheless.

At this point, DP advances the argument that it had no choice but to do business with the cartel unless it was content to stay out of the titanium field. To put it in the words of DP's counsel,

> "We respectfully submit in conclusion that it cannot be the law of the United States that it is the function of the Courts themselves to impose that form of restraint of competition which must result from a ruling that whenever a European company has a monopoly in its own country (and practically all of them do), and then has a relation in the nature of a common enterprise with some American company, it becomes the duty of all other American companies to renounce and forego access to the inventions and developments controlled by those foreign companies, and to leave them as the exclusive

property of its American competitor, the partner of those foreign companies".

Perhaps, the answer is that DP, having discovered the conspiracy, should have asked the Attorney General to break it up. Confessedly, the chances of DP getting NL's patents and know-how after such a hostile act would be, to say the least, dubious. But in any event the courts may not validate unlawful conduct because in a particular instance there may be social losses involved in enforcing the law. The paradox which DP discovers, even if it were a genuine one, would be of interest to Congress, not to the courts. But the paradox is not genuine. The conflict is a specious one. Judicial intervention to break up a combination in restraint of trade is not in itself a restraint of trade, although for a time the established channels of commerce may be disarranged. To prohibit adherence to conspiratorial trade restraints hampers trade in about the same way that the prohibition against the circulation of counterfeit money hampers it. It may prevent the consummation of a particular transaction but in the long run it frees business from private regimentation and secures it against those who would trammel it.

III. DP's relations to American Producers.

The case also presents the question whether the contract between NL and DP is offensive to the anti-trust laws independently of the relation of that contract and the parties thereto to the foreign producers.

There are two competing producers who, at the time their agreement is made, between them control 100% of the commerce in titanium products in the United States.

They agree not only to settle their conflicting patent claims —which presumably they may do under the Gasoline Cracking case—but they agree to exchange all future patents, patent applications and know-how. Though these exchanges are not on an exclusive basis, is it not clear, however, that the capacity of such a combination to dominate the market is vastly increased, that the capacity for the exclusion of outsiders from the industry is multiplied? In other words, was not Mr. Ewing, DP's London manager, (whose disavowal of authority to make the following statement I accept) saying no more than the obvious when he wrote in 1933, concerning the NL-DP agreement:

> "We look upon this patent pool as a definite advance in cooperation and the strengthening of both parties' position to the exclusion of outsiders"?

I think so.

When the effect of an arrangement is obvious it is fair inference that the parties intended that effect. The accumulation of great power to restrain trade may in itself be an evil;

> *U. S.* v. *American Tobacco Co.*, 1911, 221 U. S. 106, 175.

When the power thus acquired is exerted to accomplish unreasonable restraints of trade, it is surely an evil. A pertinent question is, therefore, how did NL and DP exercise the great power they acquired.[15]

NL licensed one American producer, American Zirconium, and on conditions which required submission to the illegal 1920 contract. It never did license Virginia Chemical; and the evidence is rather persuasive that it did not achieve agreement on royalties and could not get from Virginia Chemical written adherence to the 1920 agreement

and that Virginia Chemical was not sufficiently well known to the Europeans to warrant acceptance of its oral assurance.

DP licensed both American Zirconium and Virginia Chemical. In both instances the licenses were subject to a severe tonnage limitation on the product made under the license and to a royalty on all titanium dioxide produced, whether under the licensed patents or not. DP makes much of the fact that the evidence shows that it never refused a license. It is also true, however, that until 1944, DP did refuse licenses unencumbered by tonnage limitations.

Another inevitable consequence of the NL-DP agreement has been the proliferation of patents. The chief spur to private resistance to the grant of patent monopolies has been withdrawn from the parties who, ordinarily, would be chiefly concerned. It is not without significance that, despite the jaundiced eye with which the courts have been examining and rejecting patents in recent years, not a single one of the hundreds of patents here involved has ever been litigated. The result of that is that the newcomer is confronted by a veritable jungle of patent claims through which only the very powerful and stouthearted would venture, having a regard for the large initial investment which this business requires. These patents, through the agreements in which they are enmeshed and the manner in which they have been used, have, in fact, been forged into instruments of domination of an entire industry. The net effect is that a business, originally founded upon patents which have long since expired, is today less accessible to free enterprise than when it was first launched.

The exchange of know-how between NL and DP was abandoned in 1940 when, as DP says, the industry matured. The exchange of patents and patent applications continues.

The tonnage limitations in the licenses of American Zirconium and Virginia Chemical was eliminated in 1944. The power of concerted action is still there.

I need not consider whether an exchange of patents, present and future, between competitors, is violative of the Sherman Act. I assume that such an exchange standing alone is innocent. But in the context of the present case,

Associated Press v. U. S., June 18, 1945, ... U. S. ....,

this exchange between two corporations, who between them controlled the entire market, becomes an instrument of restraint, available for use and used, to continue the mastery of the market which NL and DP achieved by means of the illegal international agreements.

In order to give effect to the Sherman Act, plaintiff is entitled to a decree which will restore titanium to the system of free competition; the means of preventing such a development must be destroyed and the power to prevent it must be shorn from those who, by combination, have acquired it.

It is, perhaps, not customary to express, in an opinion, the praise which the attorneys who tried this case deserve for the very high order of professional learning which they brought to it. Nothing, however, restrains me from commenting favorably upon the cooperative attitude exhibited by them which resulted in shortening the trial by many months.[18]

A decree will be entered for the plaintiff.

Dated: July 5th, 1945.

SIMON H. RIFKIND
U. S. D. J.

1) The following abbreviations will be used to identify the defendants and co-conspirators:

NL	National Lead
Tinc	Titan Company, Inc.
DP	E. I. du Pont de Nemours and Company, Inc.
TP	The Titanium Pigment Company, Inc.
Krebs	Krebs Pigment & Color Corporation
TAS	Titan Co. A/S
IG	Interessengemeinschaft Farbenindustrie Aktiengesellschaft
TG	Titangesellschaft, g.m.b.h.
SIT	Societe Industrielle du Titane
ICI	Imperial Chemical Industries, Ltd.
GW	Goodlass Wall and Lead Industries, Ltd.
ISC	Imperial Smelting Corporation
BTP	British Titan Products, Ltd.
NTP or Laporte	National Titanium Pigments, Ltd.
CIL	Canadian Industries, Ltd.
CTP	Canadian Titanium Pigments, Ltd.
Kokusan or KK	Kokusan Kogyo Kabushiki Kaisha
TK	Titan Kogyo Kabushiki Kaisha
Terres Rares	Societe de Produits Chemiques des Terres Rares
Thann	Fabriques de Produits Chemiques de Thann et de Mulhouse
Montecatini	Societa Anonima Titanium
Aussig	Verein fur Chemische und Metallurgische Produktion Aussig

2) American Zirconium and Virginia Chemical engaged in the production of only pure TiO_2. Of extended titanium pigments, NL and DP produced 100% of the amount consumed in the American market.

3) "Licensed field" was defined to mean "(1) all methods, processes and apparatus in the field of manufacture and use of all titanium compounds, containing two per cent. (2%) or more of the element titanium in a chemically, mechanically or physically combined state, and mixtures thereof, which can be used as pigments, whether or not adapted for other uses, and (2) all such titanium compounds and mixtures which can be used as pigments, whether or not adapted for other uses".

4) Virginia Chemical also licensed DP under one of its patents and applications. TiO_2 produced by Virginia Chemical by the process disclosed in this patent and application was expressly exempted from the quantity and royalty provisions.

5) The attorney for the United States has suggested the following definition: "A combination of producers of any product joined together to control its production, sale and price, and to obtain a monopoly in any particular industry or commodity".

Words and Phrases (Permanent Edition) contains no definition of the word; neither does the Federal Digest. Bouvier's Law Dictionary defines cartel thus: Agreements between belligerents authorizing certain non-hostile intercourse between one another, which would otherwise be prevented by the state of war..

In Monograph No. 1, of the Subcommittee on War Mobilization of the Committee on Military Affairs, U. S. Senate, 78th Congress, 2d Session (commonly called the Kilgore Committee) the following is presented:

"Cartels have been defined by two of the foremost members and advocates of such bodies. In the words of Sir Alfred Mond, organizer of Imperial Chemical Industries:

'I use the word cartel to include fusion, pooling arrangement quota arrangement and price convention, because a cartel is protean in its form. * * * In an ultra-technical way, a cartel might be defined as a combination of producers for the purpose of regulating, as a rule, production, and, frequently, prices. That does not involve giving up the identity of the different firms. It is not usually made for a period lasting more than a limited time. It does not necessarily carry with it, though in some cases it does, joint selling agencies. Sometimes, too, it carries with it quotas of production. But all this is, perhaps, too narrow a definition. The Germans have a term *Interessen-gemeinschaft* * * * a union or similiarity of interest. The great German Dye Trust started with what they call *Interessen-gemeinschaft*. When first formed it was a fairly loose combination to regulate production and prices. It has been substituted since by an absolute and complete fusion and exchange of shares—what we should call a complete amalgamation—which is the final and most complete form of any kind of cartel which can be imagined.'

"In the words of Sir Felix J. C. Pole, chairman of Associated Electrical Industries, Ltd.:

'A cartel or association usually means an association by agreement of companies or sections of companies having common interests. It is designed to prevent extreme or unfair competition and allocate markets, and it may also extend to interchange of knowledge resulting from scientific and technical research, exchange of patent rights, standardization of products, etc. Competition is not eliminated, but it is regulated. Competition in quality, efficiency, and service takes the place of the crude method of price cutting.'

"These quotations both emphasize the central fact that cartel activities are arrangements among business

enterprises engaged in the same type of industry to avoid some or all forms of competition. Cartel activities are designed to maximize the profits of participants by directly or indirectly maintaining prices at the level of greatest net return.

"International cartels are, of course, cartels which include business enterprises domiciled under more than one government and doing business across national frontiers. A cartel of this type may include the major enterprises operating in a given industrial field throughout the world, and may determine trade policies in that field in most, if not all, of the world's principal markets."

6) *U. S.* v. *Sisal Sales Corporation*, 1927, 274 U. S. 268.

7) *American Banana Co.* v. *United Fruit Co.*, 1909, 213 U. S. 347.

8) *Shields* v. *Barrow*, 1854, 17 How. 129; *Minnesota* v. *Northern Securities Co.*, 1902, 184 U. S. 199; *Garzot* v. *De Rubio*, 1908, 209 U. S. 283; *U. S.* v. *Northern Pacific R. Co.*, C.C.A. 8, 1905, 134 Fed. 715; *Cf. United Shoe Machinery Corp.* v. *U. S.*, 1922, 258 U. S. 451.

Whatever may be the scope of this rule, it has not interfered with the action of the courts in striking down systems deemed violative of the anti-trust laws even though such systems included leases, licenses, and other forms of agreements, and the lessees, licensees, and other parties to the agreements were not before the court.

Paramount Famous Lasky Corp., 1930, 282 U. S. 30; *Interstate Circuit* v. *U. S.*, 1939, 306 U. S. 208; *Ethyl Gasoline Corp.* v. *U. S.*, 1940, 309 U. S. 436; *U. S.* v.

Univis Lens Co., 1942, 316 U. S. 241; *U. S.* v. *Hartford-Empire Co.*, April 21, 1945, ... U. S. ....

Nor were these all cases like United Shoe Machinery Corp. v. U. S., 1922, 258 U. S. 451, where the enjoined covenants were all for the benefit of the lessor, and the injunction did not adversely affect the lessees.

Paramount Famous Lasky Corp. v. *U. S., supra; Interstate Circuit* v. *U. S., supra; Ethyl Gasoline Corp.* v. *U. S., supra.*

Were the rule advocated by NL allowed to operate in the field of restraints upon the foreign commerce of the United States, it would paralyze the enforcement of the law in all cases where one or more of the parties to the conspiracy was an alien corporation over whom the court could acquire no personal jurisdiction. The courts do not so readily permit a frustration of valid national policy. The flexibility of the decree which the court can frame allows for a great degree of accommodation. An example of that is *J. I. Case Co.* v. *N. L. R. B.*, 1944, 321 U. S. 332.

9) This argument is distinct from the "good intention and noble motive" argument which was rejected in *Thomsen* v. *Cayser*, 1917, 243 U. S. 66, 85.

10) Jebsen, unfamiliar with American laws, would not credit this reason, for he could not understand how NL had undertaken to do that which the DP lawyers claimed was prohibited. But perhaps NL was right after all, since for twenty five years it proceeded unmolested and succeeded, with the aid of the unlawful conspiracy, to build a highly profitable business and to retain a dominant position in the industry.

11) KREBS PIGMENT & COLOR CORPORATION

June 28, 1933.

CONFIDENTIAL

W. C. BESCHORMAN, Vice Pres.,
National Lead Company,
111 Broadway,
New York City, New York.

Dear Mr. Beschorman:-

We have considered the various points raised by I. G. in their cable to you with the desire, if possible, to comply with its request.

As you are aware, the Anti-Trust Laws of this country definitely prevent this Corporation from making any commitments respecting the territories of Titangesellschaft and Titan Inc. Further, these several companies are not parties to the Krebs-Titanium Pigment Agreement and so, as to them, we are unable to make any direct commitment. However, since Article II of the Krebs-Titanium Pigment Agreement definitely provides that Krebs is limited both in respect to use and sale to the territories set forth in this Article, we think the result will be eminently satisfactory to your foreign associates. As to controlling the disposition of our products by our customers, we are sure you appreciate the difficulty both from a legal and practical standpoint.

The I. G. request that Krebs grant no sub-licenses or technical aid to others in the territories of the foreign companies, is tantamount to obligating Krebs to grant exclusive licenses. The whole agreement, you will recall, for definite reasons, was placed on a non-exclusive basis. Since all licenses received from Krebs under its foreign patents, are subject to negotiation, we believe there will be no difficulty in working out a solution that will be acceptable to all par-

ties; it may well be that such negotiations will result in exclusive licenses to your foreign associates. Naturally, we shall treat technical information in the same manner as our patents.

The present form of our Agreement is the result of much care and thought on the part of both parties. It embodies, as we see it, a practicable working basis for both companies, as well as for your foreign associates.

Very truly yours,

C. H. RUPPRECHT,
President.

July 12, 1933

I. G. Farbenindustrie
Aktiengesellschaft
Frankfurt (Main)
Gruneburgplats.

Dear Sirs:

Immediately upon receipt of cablegram of June 22nd from Dr. Jebsen, a copy of which is attached, we took the matter up with the Krebs Pigment & Color Corporation, submitting to them a copy of the cable, and take pleasure in handing you a copy of their reply under date of June 28th. Careful reading of the Krebs letter will surely indicate to you the spirit in which they are entering into this contract and their efforts to meet your views. We feel that experience will prove that such will be the case.

In regard to the phrase "non-exclusive license" to which you call our attention as occurring in Article 5, Paragraph 2, we have to refer to the United States Anti-Trust Laws which absolutely forbid the granting of exclusive license between two manufacturers in the United States as such a practice would tend to

create a monopoly. Therefore, the use of this phrase "non-exclusive license" is simply to comply with the United States Laws and in practice the licenses under each others patents will undoubtedly prove to be, to all intents and purposes, exclusive.

Referring subsequently to the points brought out in your letter of June 20th, under A, B, C, D and E, you will note that the Krebs Company consider themselves limited both as to use, manufacture and selling to the territory granted to them by the agreement. While this agreement does not specifically prevent Krebs from exporting into your territory any products not manufactured under the patents of the Titanium Pigment Company and its associated companies, it will be a difficult matter to discriminate between such manufacture and manufacture under their patents and maintain close and good cooperation, and the practical effect will be that Krebs will refrain from such export.

As to exports by clients of the Krebs Company, we note that Krebs will use all their efforts to prevent any export outside of their territory which would cause any trouble to you in any way.

In regard to licenses, although non-exclusive licenses are specified throughout the agreement, you will note from the letter of Krebs Company that they are not adverse to granting exclusive licenses in case this may be found desirable by you. Under the practice, as we foresee it, these licenses will be given against a nominal payment except in cases of outstanding development.

We also see your point, that by the exclusive license you have given Titan Co. Inc., which has granted exclusive licenses to the Titanium Pigment Co. Inc., you are not in a position to trade with Krebs regarding any American patents belonging to you. However, you may rest assured that your interest in these

respects, which are also our own interests in view of our part ownership in the Titangesellschaft, will be fully and completely looked after.

At one time we considered the question of an agreement between the Titangesellschaft and Krebs covering the points in your letter, but have dropped this idea as we felt that you would be better served to have us look after your interests than to complicate the situation with a separate contract.

The only other point in your letter which we do not believe has been covered is your suggestion that the contract be changed from termination in three years to termination in five years. Frankly, there is no possibility of the contract being terminated at any time that we can foresee, and I am glad that you did not make any especial point of this either in the cable or in your letter of June 20th.

May I add that we certainly appreciate your attitude and the views you have put forward in your letter to Dr. Jebsen and trust that you will not be disappointed in the future by following the lines we have suggested. May we ask for further advice from you as to whether the Krebs letter and above make the whole matter satisfactory.

Very truly yours,

W. C. BESCHORMAN,
Executive Vice President.

Copy to—Dr. Kuhne
Dr. Jebsen
Mr. Rupprecht
Mr. Tasker, Vice Chairman, British T. P. Co.

This letter was sent on July 21, 1933.

12) The letter was not found in DP's files.

13) In view of this finding, I do not reach the question whether doing business with an illegal combination constitutes joining the combination; see *Virtue* v. *Creamery Package Mfg. Co.*, 1913, 227 U. S. 8; cf. *Direct Sales Co.* v. *U. S.*, 1943, 319 U. S. 703.

14) Compare, *U. S.* v. *Colgate & Co.*, 1919, 250 U. S. 300; *U. S.* v. *Schrader's Son, Inc.*, 1920, 252 U. S. 85.

15) "In the case at bar, the primary defendants own competing patented processes for manufacturing an unpatented product which is sold in interstate commerce; and agreements concerning such processes are likely to engender the evils to which the Sherman Act was directed" *Standard Oil Co.* v. *U. S.*, 1931, 283 U. S. 163, 175.

16) Over 1400 exhibits were received in evidence.

IN THE

District Court of the United States

FOR THE SOUTHERN DISTRICT OF NEW YORK

UNITED STATES OF AMERICA, *Plaintiff*, *against* NATIONAL LEAD COMPANY, TITAN COMPANY, INC., E. I. DU PONT DE NEMOURS AND COMPANY, *Defendants.*	Civil No. 26-258

FINDINGS OF FACT AND CONCLUSIONS OF LAW

FINDINGS OF FACT

1. This is an action by the United States to prevent and restrain alleged violations of Sections 1 and 2 of the Sherman Antitrust Act, 26 Stat. 209 (1890), 15 U. S. C. §§ 1, 2 (1940). The Court has jurisdiction of the subject matter and of the parties. The defendant National Lead Company (NL) is a New Jersey corporation. The defendants Titan Company, Inc. (Tinc) and E. I. du Pont de Nemours and Company (DP) are Delaware corporations. NL and Tinc have offices and are found and transact business in this District. DP has its office and principal place of business at Wilmington, Delaware, but is found and

transacts business in this District. The business of the defendants and their connection with the activities and violations alleged are described in subsequent findings. The Titanium Pigment Company, Inc. (TP) and Krebs Pigment and Color Corporation (Krebs), both corporations, now dissolved, are co-conspirators but are not made defendants. The following foreign corporations are co-conspirators but are not made defendants:

Titan Co. A/S (TAS)
Interessengemeinschaft Farbenindustrie Aktiengesellschaft (IG)
Titangesellschaft, m.b. H. (TG)
Societe Industrielle du Titane (SIT)
Imperial Chemical Industries, Limited (ICI)
Goodlass Wall and Lead Industries, Limited (GW)
Imperial Smelting Corporation, Limited (ISC)
British Titan Products Company, Limited (BTP)
National Titanium Pigments, Limited (Laporte)
Canadian Industries, Limited (CIL)
Canadian Titanium Pigments, Limited (CTP)
Kokusan Kogyo Kabushiki Kaisha (KK)
Titan Kogyo Kabushiki Kaisha (TK)
Societe de Produits Chimiques des Terres Rares (Terres Rares)
Fabriques de Produits Chimiques de Thann et de Mulhouse (Thann)
Societa Anonima Titanium (Montecatini)
Verein fur Chemische und Metallurgische Produktion (Aussig)

2. The defendants DP and NL are engaged in the business of manufacturing, selling and transporting titanium pigments in commerce among the several states of the United States and between the United States and certain foreign nations.

3. The defendant NL has assets in excess of $100,000,000. It is the largest manufacturer of titanium pigments and compounds in the United States and the largest manufacturer of titanium pigments and compounds in the world, manufacturing and selling 76.5 per cent of composite and 46.4 per cent of pure TiO_2 in the United States in 1943. NL conducted all its activities relating to the manufacture and sale of titanium pigments and compounds through TP until the dissolution of the latter in 1936 and thereafter conducted such operations through its own Titanium Division.

4. The defendant NL owned after December 31, 1927, approximately 87 per cent of the stock of TAS and since January 1944 has owned or controlled approximately 99 per cent of said stock.

5. The defendant NL owned 87 per cent of the stock of Tinc from the date of its incorporation in 1929 to January 28, 1944, at which time it acquired and now owns 100 per cent of said stock.

6. The defendant Tinc since its incorporation in 1929 acquired and now owns the following percentages of voting stock in the following named corporations:

BTP—44%
TG —50%

SIT —57.638%
TK —18.5%

7. The defendant Tinc, in 1929, acquired some of the business assets of TAS and assumed all of the obligations of and was entitled to receive all the benfits of contracts Exhibits A, A-1, A-2, B, B-1, B-3, C, C-3, C-8 and other contracts of TAS.

8. The defendant Tinc, since its incorporation, has owned a number of patents and has held exclusive licenses, with the right to grant sublicenses, under patents pertaining to the manufacture and use of titanium pigments and compounds. A majority of Tinc's officers and directors are and since its organization have been officers and directors of defendant NL.

9. The defendant DP is one of the largest chemical companies in the United States with assets in excess of $1,000,000,000. The defendant DP is also one of the largest manufacturers of titanium pigments in the United States, manufacturing and selling approximately 23.5 per cent of the composite pigments made in the United States and 45.1 per cent of the pure TiO_2 made in the United States in 1943. It is also the second largest manufacturer of titanium pigments and compounds in the world. The defendant DP entered the titanium pigment business in July, 1931, and until January 1, 1936, conducted all its activities relating to the manufacture and sale of titanium pigments and compounds through Krebs, after which time it conducted its titanium pigment activities through the Krebs Division of DP.

10. Krebs was a Delaware corporation formed in July, 1931, by the defendant DP, the Grasselli Chemical Co., a wholly-owned subsidiary of DP, and the Commercial Solvents Corporation to acquire the business of Commercial Pigments Company (referred to herein as CP), the Krebs Pigment & Chemical Co. and the pigment business of the Grasselli Chemical Co. CP was the only one of the foregoing companies engaged in the manufacture and sale of titanium pigments and compounds prior to the acquisition of its business by Krebs. The defendant DP acquired a 70 per cent stock interest in Krebs at that time and committed itself to engage in the titanium pigment business only through Krebs. The defendant DP acquired the remaining 30 per cent of the stock of Krebs in December 31, 1934. On December 31, 1935, defendant DP acquired all the assets of Krebs and assumed all the obligations of Krebs, thereafter operating the titanium pigment and compound business of said Krebs directly through the Krebs Division of the defendant DP. Krebs continued to operate under the Blumenfeld United States patents and process after it acquired the assets of CP in July, 1931, as has the defendant DP at all times since December 31, 1935. In August, 1933, Krebs acquired by license the right to use all United States patents owned or thereafter acquired by TP or NL which related to the manufacture and use of titanium pigments; and subsequently, as will appear, it acquired by licenses additional United States patent rights from NL's foreign associates. C. H. Rupprecht was a director and president of Krebs from its incorporation until its dissolution and was in charge of the titanium pigment operations of the defendant DP from July, 1931, until his decease September 10, 1944. Krebs also owned a substan-

tial stock interest in Travancore Minerals Company, Ltd., which held rights in extensive ilmenite sand deposits in India. This stock was among the assets of CP acquired by Krebs.

11. TP was a Maine corporation organized in 1916 and was engaged in the manufacture of titanium pigments and compounds from 1920 until its dissolution in 1936. After 1920 the defendant NL acquired stock in said company until December 30, 1932, at which time NL owned all the stock of TP. NL controlled all the activities and policies of TP after 1920 until its dissolution in 1936, at which time all of the assets and liabilities of TP were taken over and its titanium business continued by the defendant NL as a division of NL. TP owned and was the exclusive licensee of many patents relating to the manufacture and use of titanium pigments and compounds, including the Barton-Rossi and Jebsen patents and processes. TP manufactured composite pigments principally; but it also began manufacturing a pure TiO_2 after 1928 in competition with CP.

12. CP was a corporation formed by Commercial Solvents Corporation in 1928. CP acquired the Blumenfeld and other patents in the United States relating to the manufacture and sale of titanium pigments and compounds and from 1928 was engaged in the manufacture of titanium pigments in the United States, operating a plant at Baltimore, Md. It manufactured a pure TiO_2 pigment only and sold it in competition with TP. All its assets were acquired and some of its obligations were assumed by Krebs in July, 1931.

13. TAS was a Norwegian Corporation with its principal place of business at Fredrikstad, Norway, and from

some time prior to 1920 until about 1929 was engaged in the manufacture of titanium pigments and compounds in Norway. Said TAS owned the Jebsen and other patents relating to the manufacture of titanium pigments and compounds and also controlled through A/S Titania large deposits of ilmenite in Norway. It was authorized by TP to use the Barton-Rossi and other patents and processes relating to the manufacture and use of titanium pigments and compounds in 1920. Its activities and policies have been controlled by the defendant NL since 1927. It ceased the manufacture of titanium pigments and compounds in 1929. Thereafter, substantially all titanium pigments and compounds sold by TAS were purchased from TG. TAS continued to function as selling agency for defendant Tinc in part of the territory reserved to Tinc after 1929.

14. IG is a German corporation with its principal place of business in Frankfurt, Germany, and is one of the largest corporations in Germany and one of the largest chemical companies in the world.

15. TG is a German corporation with its principal place of business at Leverkusen, Germany, and was organized in October, 1927, by TAS and IG and in 1939 was the largest producer of titanium pigments and compounds in Europe. TG was licensed to use the Barton-Rossi and Jebsen patents and processes and owns and is licensed to use other patents relating to the manufacture and use of titanium pigments. TG has a right to use some of the DP patents relating to the manufacture and use of titanium pigments and compounds.

16. SIT is a French corporation with its principal place of business at Paris, France. It received a license

from TAS in 1927 to manufacture titanium pigments and compounds in France under the Barton-Rossi and Jebsen patents. No factory was ever erected by the said company to manufacture titanium pigments or compounds in France. In 1927 defendant NL purchased a controlling interest in SIT. SIT has a right to use some of DP's patents relating to the manufacture and use of titanium pigments and compounds.

17. ICI is a corporation organized and existing under the laws of the United Kingdom with its office and principal place of business at London, England, and is the largest manufacturer of chemicals in the British Empire with assets in excess of £100,000,000.

18. GW is a corporation organized under the laws of the United Kingdom with its principal office and place of business in London, England, and is the largest producer of lead and lead pigments in the British Empire.

19. ISC is a corporation organized and existing under the laws of the United Kingdom with its office and principal place of business in London, England, and is one of the largest producers of pigments in the British Empire.

20. BTP is a corporation organized and existing under the laws of the United Kingdom with its office and principal place of business at Billingham, England, and was registered in August, 1930, by ISC with the knowledge and approval of the defendants NL and Tinc. BTP is the largest manufacturer of titanium pigments and compounds in the British Empire. BTP is licensed to use the Barton-Rossi and Jebsen patents and processes and owns and is licensed to use other patents relating to the manufacture of titanium pig-

ments and compounds. BTP also has a right to use some of the DP patents relating to the manufacture and use of titanium pigments and compounds.

21. ICI, GW, and ISC subscribed to and each owns 17 per cent of the stock of BTP. Each acquired said stock on or about the time said BTP commenced active operations in the titanium pigment and compound business in the British Empire in February, 1933.

22. Laporte is a corporation organized and existing under the laws of the United Kingdom with its office and principal place of business at Luton, England, and is the only other producer of titanium pigments and compounds in the British Empire and manufactures titanium pigments and compounds under the Blumenfeld patents and process in England.

23. CIL is a corporation organized and existing under the laws of the Dominion of Canada with its office and principal place of business at Montreal, Canada, and is the largest chemical manufacturer in Canada. Approximately 43 per cent of its stock is and has been owned by the defendant DP since 1928 and approximately 43 per cent of its stock is and has been owned by ICI since 1928.

24. CTP is a corporation organized in January, 1937, and existing under the laws of the Dominion of Canada with its office and principal place of business at Montreal, Canada. Defendant NL has since the incorporation of CTP owned 49 per cent of the voting stock of CTP. The balance of the voting stock is owned by CIL. CTP is the only company engaged in the titanium business in Canada

and owns and/or is licensed to manufacture titanium pigments under the Blumenfeld, Barton-Rossi, Jebsen and other patents in Canada. Said CTP is not now manufacturing titanium pigments and compounds in Canada; since 1939 it purchased all of its requirements for sale in the Dominion of Canada from NL and to a slight extent from DP. NL is required to supply the requirements of CTP on a cost plus basis until CTP commences the manufacture of titanium pigments or compounds.

25. KK is a Japanese organization and is the largest manufacturer of paints in Japan and is a subsidiary of Nippon Sangyo, one of the largest industrial enterprises in Japan.

26. TK is a Japanese organization existing under the laws of Japan with its office and principal place of business in Tokyo, Japan. TK was organized in 1936 by Tinc, IG, TG. Terres Rares, and Thann. Since its organization approximately 50 per cent of the stock of TK has been owned by KK, 18½ per cent by Tinc, 16½ per cent by IG, and 15 per cent by Terres Rares and Thann. TK is the largest manufacturer of titanium pigments and compounds in Japan, owns many patents relating to the manufacture and use of titanium pigments and compounds, and is licensed to use the Barton-Rossi, Jebsen and Blumenfeld patents and processes in the Japanese Empire. TK also has a right to use some of the DP patents relating to the manufacture and use of titanium pigments and compounds.

27. Terres Rares is a French corporation with its principal place of business at Paris, France; it acquired the Blumenfeld and other patents relating to the manufacture

and use of titanium pigments and compounds in or about the year 1920.

28. Thann is a French corporation with its office and principal place of business at Paris, France, and is the only manufacturer of titanium pigments and compounds in France. It manufactures such pigments and compounds under the Blumenfeld patents and process.

29. Montecatini is an Italian corporation with its office and principal place of business at Milan, Italy, and is a subsidiary of the largest manufacturer of chemicals in Italy. Montecatini is the only manufacturer of titanium pigments and compounds in Italy and is licensed to use the Blumenfeld patents and process.

30. Aussig is a corporation organized under the laws of Czechoslovakia with its office and principal place of business at Prague, Czechoslovakia. It is the largest chemical company in Central Europe and is the only manufacturer of titanium pigments and compounds in Czechoslovakia and is licensed to use the Blumenfeld patents and processes.

31. American Zirconium Corporation (referred to herein as Zirconium) is a subsidiary of the Glidden Co. and sells and ships TiO_2 from its Baltimore, Md., factory into other states in the United States. Zirconium owned certain patents relating to the manufacture of titanium pigments and compounds prior to 1934. It was first licensed to use certain TiO_2 patents by DP on August 19, 1935, by license agreement dated January 1, 1935. Zirconium was licensed by NL to use all of its patents relating to the manufacture of titanium pigments and compounds

on May 6, 1935. The license from the defendant NL to Zirconium was cancelled by agreement (Ex. NL 29) on March 9, 1944. Zirconium manufactures only pure TiO_2. It produced less than 5 per cent of the aggregate production of TiO_2 produced in the United States between 1935 and 1943.

32. Virginia Chemical Corporation (referred to herein as VC) is a subsidiary of American Cyanimid Company and formerly a subsidiary of Interchemical Company and sells and ships TiO_2 between some of the states of the United States. VC was organized in 1935 to manufacture titanium pigments. It owned certain patents relating to the manufacture and use of titanium pigments and compounds. The defendant DP first licensed VC to use certain of its TiO_2 patents on August 5, 1937. VC produces only pure TiO_2 and produced less than 5 per cent of the aggregate production of TiO_2 in the United States between 1936 and 1943.

33. Titanium pigments and compounds are manufactured from titanium which is the ninth most abundant element on the earth's surface. Titanium is contained in ilmenite and other minerals. Sands and rock formations containing ilmenite are found in India, the United States, Norway, Brazil, and elsewhere throughout the world. Titanium pigments are possessed of great opacity, hiding power and chemical inertness, and are largely displacing other pigments such as lithopone and white lead. Titanium pigments are used in the manufacture of paints and are also used in the manufacture of rubber, glass, paper, vitreous enamels, and many other products. Titanium pigments are sold in the United States and abroad in competition

with other forms of white pigments, notably lithopone and white lead, which are sold in the United States in substantial quantities by a number of commercial concerns other than the defendants and some of which are sold by the defendants.

In and before 1920 there was no substantial trade or commerce in, and no commercial manufacture of, titanium pigments for use in paint, paper, rubber, or other products; pigments used for such purposes were lithopone, white lead, and zinc oxide. The use of metallic titanium in alloys was under development by Titanium Alloy Manufacturing Company at Niagara Falls, N. Y., and chemists engaged in that work (principally Barton and Rossi) were aware of the possibilities of titanium dioxide as a pigment; several important patents on processes and products had been taken out by them, largely for the manufacture of composite titanium pigments; and a subsidiary, TP, had been formed by Titanium Alloy to engage in further research, development, and promotion in the pigment field. Before 1920 tests and demonstrations conducted by TP had attracted the attention of large manufacturers of pigments and paints,—Pittsburgh Plate Glass (paints), New Jersey Zinc (pigments), the defendant DP (pigments and paints), and the defendant NL (pigments),—who investigated TP's processes and products; and this led in 1920 to purchase by NL of 10% of the stock of TP, with an option to purchase up to 50%.

While the research and experimental work described was going on in the United States, Gustav Jebsen, a Norwegian chemist and business man, was making a similar investigation, albeit along different lines, in Norway—this in connection with his search for means of putting to industrial use large deposits of Norwegian ilmenite-bearing ore.

By 1920 Jebsen and his associates had perfected processes patented in Norway, the United States, England, Germany, and in other countries, an important feature of which was disclosure of means for producing relatively pure titanium dioxide pigments by direct application of relatively small quantities of sulphuric acid—a process much less costly than that then developed and in use experimentally at Niagara Falls. Though the Norwegian chemists were aware of the possibilities of composite pigments, they had not perfected processes for the manufacture of such products. In 1920 the process and product patents of Jebsen and his associates were held by TAS, a Norwegian Company.

34. Joseph Blumenfeld, a chemist and managing director of Terres Rares, in or about 1922 obtained patents relating to the manufacture of titanium compounds which he assigned to Terres Rares. Blumenfeld patents issued both in the United States and various foreign countries. While CP was entitled to receive rights under all Blumenfeld titanium pigment inventions patentable in the United States, it was not licensed under and did not own any Blumenfeld patents which issued in foreign countries.

35. The production of titanium pigments in the United States has risen from 100 tons (on the basis of pure TiO_2 content) in 1920 to approximately 110,000 tons in 1943 with a peak production of approximately 128,000 tons in the United States in 1941. The total production of titanium pigments and compounds outside of the United States has shown less growth, the estimated foreign production of titanium pigments and compounds being approximately 1,000 tons in 1920 and approximately 23,000 tons in 1938.

36. Before World War II the leading American manufacturers of titanium pigments, the defendants NL and DP, obtained their supplies of ilmenite from India. Since about August, 1942, however, their supplies have come mainly from a New York deposit owned by NL and operated by NL pursuant to and in accordance with a directive of Office of Production Management approved by the Attorney General of the United States. NL was directed to, and did, offer participation in this project to each of the other producers of titanium pigments in the United States. The offer was accepted by DP. NL invested more than $10,000,000 in this enterprise.

37. Prior to 1930 the principal producers and sellers of titanium pigments in the world were divided into two groups, the NL group and the Blumenfeld group. The NL group included TP, TAS, SIT, TG, and TINC and were using principally the Barton-Rossi and Jebsen patents and processes for the manufacture of titanium pigments. Each of the companies named had been allocated exclusive marketing territories throughout the world by agreements. The Barton-Rossi patents were and are owned either by TP or NL. The Jebsen patents were and are owned either by TAS or TINC. The patents upon which NL's titanium business was originally founded in 1920 were Barton-Rossi and Jebsen patents. DP and NL were of the opinion that these would expire by the end of 1934. The Blumenfeld group consisted of Terres Rares, Thann, Aussig, Montecatini, and CP to each of which companies Terres Rares had allocated exclusive territories throughout the world. A number of United States titanium pigment patents issued other than the Barton-Rossi and Jebsen patents, including the United States patents covering the Blumenfeld process,

some of which do not expire until 1948 or thereafter. All of the companies engaged in the manufacture of titanium pigments in the United States on a commercial basis use a sulfuric acid process based on the Barton-Rossi, Jebsen, and Blumenfeld patents. The patents relating to titanium pigments and compounds comprise considerably more process claims than product claims. The process claims, with the exception of those of the so-called Rutiox patents which relate to the production of rutile-type titanium pigments, cover for the most part improvements in manufacturing processes originally disclosed in the Barton-Rossi, Jebsen, and Blumenfeld patents, which improvements have led to the improved present-day commercial titanium pigments. The product claims cover practically all such improved titanium pigments; thus, of 23 different grades of titanium pigments (i.e. different products) sold by NL, 21 are covered by unexpired patents. The validity of none of these patents was ever passed upon by any court of record in the United States.

38. The Auer Company developed a process for the manufacture of titanium pigments and compounds in Germany in the early 1920's, was not successful, and ceased manufacturing in 1931. The Auer patents were acquired in November, 1932, by Krebs. They were not of much consequence.

39. TP, on January 1, 1933, owned approximately 67 United States patents and 22 patent applications relating to the manufacture and use of titanium pigments and compounds. It also had the right to use by exclusive license 34 United States patents and 13 patent applications of its foreign associates. TP owned 229 patents in 24 foreign

countries prior to January 1, 1933. TP commercially used only 25 patents and patent applications out of a total of 136 patents and patent applications (18 per cent) which it owned or had the right to use prior to January 1, 1933.

40. NL now owns or controls 75 United States patents and 28 patent applications relating to the manufacture and use of titanium pigments and compounds and has exclusive licenses on 2 TAS, 18 Tinc, 17 IG and 1 TG patents and 4 TG patent applications. It also owns 3 patents in Canada and has non-exclusive licenses on 7 patents in South and Central American countries. NL is also licensed to use 156 DP patents and 30 DP applications and is accordingly entitled to use approximately 269 United States patents and 63 applications. It commercially uses only 66 patents and applications out of a total of approximately 332 which it owns or has the right to use or approximately 20 per cent. There is no evidence that NL obtained patents for the purpose of "blocking" or "fencing".

41. Krebs owned approximately 30 United States patents and 24 applications relating to the manufacture and use of titanium pigments and compounds and owned no foreign patents or applications prior to January 1, 1933. Krebs commercially used a total of 18 such patents and applications or approximately 33 per cent of the total which it had the right to use. DP now owns approximately 174 United States patents and 32 applications. It also owns 48 patents and 14 applications in Canada, 13 patents and 9 applications in England, 20 other patents in 7 other countries including 8 in Japan. It is licensed to use 96 patents and 27 applications of NL or its foreign associates in the United States. It accordingly now owns or has the right to use approxi-

mately 270 United States patents and 59 applications. It uses commercially approximately 70 such patents and applications or about 20 per cent. There is no evidence that Krebs or DP obtained patents for the purpose of "blocking" or "fencing".

42. There are now four producers of titanium pigments in the United States: NL, DP, American Zirconium and VC. As will hereinafter appear, NL and DP have cross licensed each other under their respective patents. Zirconium entered the field in 1935 with licenses from both NL and DP; the NL license was cancelled by agreement in 1944. VC entered the field in 1937 with a license from DP.

43. At no time were there imports of any consequence from abroad. In and after 1922 the tariff applicable to titanium compounds was 30% ad valorem.

44. On July 30, 1920, TP and TAS entered into an agreement, in writing, Ex. A which is uncancelled. This agreement was negotiated on behalf of TP by McCarty, a vice president of NL, now dead, and on behalf of TAS, by Jebsen, who testified at the trial.

The essential features of the agreement are:

(a) The field to which the contract was to apply was defined as including all substances containing above 2% of titanium (unless such substances contained by weight more than 5% of a metal other than titanium in its purely metallic state) and all apparatus, methods, and processes useful in obtaining or manufacturing such substances (except as stated). The intention was to cover processes, substances, and apparatus in the titanium and titanium compound field.

(b) TAS agreed to grant to TP and the latter agreed to accept "a license exclusive of all others including" TAS under all "existing or future" patents of the Norwegian company; but only in or for territories within North America (defined as including the continent of that name, Central America, and Panama); and TP agreed to grant to TAS the correlative rights, but only outside North America, under the existing or future patents of TP. The parties agreed not to sell outside their respective territories, except that reciprocal non-exclusive rights of sale were reserved for South America.

(c) Detailed provision was made for exchange of copies of applications for patents filed by the parties or their other licensees, and for the filing and payment of expenses incidental to the prosecution of such applications and maintenance of patents in territories outside the territory of each; and there was provision for assignment by each company to the other in case either party elected not to prosecute applications or maintain patents outside its territory.

Neither party would ever question or contest the validity of any patent of the other under which it is licensed (within the licensed field).

(d) TAS made TP the exclusive agent of TAS for sales by TAS in North America, such sales to be at prices and on terms determined by the agent, and TP similarly made TAS its sole agent for sales by TP outside North America and South America. (With a view to "the widest possible development of titanium products in the 'Licensed Field'", it was agreed that, notwithstanding the agencies provided for, importations of "finished articles"—that is, paint, paper, rubber, glass, etc.—containing titanium prod-

ucts of the principal, its licensees or sublicensees, would be permitted provided such products did not constitute such an important part of such finished articles that sales within the agent's territory would substantially interfere with the agent's sales of its own titanium products.)

(e) Each party would impart semi-annually to the other full and accurate information in detail as to knowledge obtained in and applicable to the "licensed field"; and would permit the other to inspect and study operations at its plants (exclusive of research laboratories).

(f) The reciprocal grants of exclusive licenses would extend to December 31, 1936, and thereafter for periods of ten years each, with provision for termination by notice to be given at least five years before the end of any such period; and it was agreed that upon such termination each would receive for itself and its licensees within its territory a non-exclusive license under inventions covered by existing patents or applications of the other, but that in other respects the obligations, liabilities, and benefits would cease. (Notice of termination has never been given).

(g) In Article XIV of the 1920 agreement (mentioned by number because of its significance in connection with later agreements) it was provided that each company would have the right, so long as it held an exclusive license from the other under the 1920 agreement, to grant licenses under its own patents and sublicenses under the other's patents on condition, nevertheless, that every such licensee or sublicensee would (i) grant to the party to the 1920 agreement other than its licensor its patent rights in the "licensed field" identical in character, territorial scope, and duration

to those given by its licensor to the other party to the 1920 agreement, (ii) would appoint such other party its sole agent as specified above in respect of its licensor, and (iii) would impart technical information to such other party in the same manner and to the same extent as its licensor. The obligations of TP under this contract were assumed by NL in 1936. The obligations of TAS under this contract were assumed by Tinc in 1929.

45. Simultaneously with the execution of the contract Exhibit A, defendant NL entered into a contract with TAS and TP, Exhibit A-1, which has not been cancelled. NL agreed to respect the provisions of contract Exhibit A and to promptly assign to TP all patents, inventions and improvements relating to titanium pigments or compounds which it then used or might thereafter acquire or whichever should be at its disposal throughout the world. In a separate contract, Titanium Alloy, also a stockholder in TP, agreed with TP and TAS to assume the same obligations as NL.

46. Defendant NL and TAS had a three fold purpose in bringing about and entering into the aforementioned agreements of 1920. The first was to promote the more rapid development of the titanium business by securing to each the right immediately to use the processes and products covered by the patents held by the other, together with future developments and technological improvements and "know how", and consequently the licenses received by each company could be fully utilized, and neither would be inclined nor able to withhold information from the other, nor make use of inventions or developments of the other for or in connection with further inventions or developments not

fully shared with the other. The second was to keep these patent rights and technological know-how as the exclusive possession of the contracting parties and their respective sublicensees under Article XIV. The third was to prevent competition between the parties to the agreement and between their respective sublicensees and between each of the parties and the sublicensees of the other. The agreements had their intended effect.

47. Between 1920 and 1927 TAS suffered business and financial difficulties which led in 1927 (when IG was negotiating for the purchase of its stock, then controlled by Norwegian banks) to the purchase by NL of 87% of the stock of TAS (Jebsen retaining 13%). Since 1929 the rights and obligations of TAS under the 1920 agreement have been held by Tinc, a Delaware company in which NL now owns all the stock. The intended purpose of the acquisition of control of TAS by NL was to utilize TAS and the contract of 1920 to further control competition in the manufacture of titanium pigments and compounds in all markets of the world including the United States.

48. This purpose was accomplished. The defendant NL and TAS agreed to have TAS and subsequently defendant Tinc form in each of the important industrial countries of the world, in association with a local corporation or firm which contemplated the manufacture and sale of titanium pigments and compounds or which could contribute to the technical or commercial development or which threatened to be a serious competitor of NL and TAS, a new company in which NL or TAS were to have a part interest. Any new company so formed was to be given certain territory in which it would have the exclusive right

to manufacture and sell titanium pigments and compounds free from any exports into said territory by NL. The new company so organized was to refrain from competing with NL in its territory (the United States and other countries of North America) or in the territory of any other company associated with NL. TAS and subsequently defendant Tinc were to make said contracts providing for the formation of the new companies and NL was to be bound to adhere to all of the territorial restrictions placed on TAS and subsequently defendant Tinc in such contracts by virtue of contract Exhibit A. All the present and future patents belonging to NL or TAS or any of the companies associated with either in the formation of such new companies, as well as those of the new companies to be organized, were to be licensed exclusively to NL for North America and to the new companies to be organized for their respective exclusive territories and to TAS and subsequently defendant Tinc for the rest of the world.

49. On or about March 3, 1927, TAS entered into a written contract, Ex. B, under which TAS allocated France and its territories, except those appurtenant to the territories of North and South America, to SIT as its exclusive territory in which to engage in the titanium pigment business. SIT assumed all the obligations imposed upon TAS by Exhibit A for the territory allocated to SIT and was entitled to receive all of the benefits for this territory to which TAS was entitled by Exhibit A. This contract Exhibit B is still uncancelled and by its terms is not to be terminated before 1951. (TAS owned about 20% of the French company; NL acquired an additional 58%, which in 1929 was transferred to Tinc; the remainder was held in France by members of the public.)

50. The hope that the French company would use its license from the Norwegian company to manufacture in France, and thus contribute to the fund of processes and technical information available to TAS and TP, was not realized; SIT served merely as a local selling agency for titanium pigments produced elsewhere.

51. Prior to 1927, NL regarded IG as either a potentially invincible competitor or the most powerful ally. NL and TAS entered into negotiations with IG in 1927 and in or about October, 1927, nine separate contracts were entered into (Exs. C to C-8, inclusive). TAS entered into a contract with IG to create TG. IG agreed to engage in the titanium pigment business only through TG and TAS agreed not to engage in the titanium pigment business in the territory allocated to TG except through TG.

In a series of ancillary agreements IG undertook (i) to provide a factory site and building near its Leverkusen works (rent at 6% of the value of the building); (ii) to furnish steam, gas, water, and electricity (at cost), (iii) to supply transportation facilities (at reasonable prices), and (iv) to deliver raw materials (at cost plus 10%, but not more than the competition charged, with provision for "most-favored" customer. treatment). IG was appointed agent of TG for sales in the territory allocated to TG. TG agreed to satisfy its ore requirements by purchases from TAS at cost plus 30-50%.

TG was to confine its manufacturing and selling operations to the exclusive territory allocated to it by TAS, to wit, Germany, Russia, Austria, Hungary, Czechoslovakia, Switzerland, Rumania, Serbia, Croatia, Slovenia, Bulgaria, Greece, Turkey, Japan, China and Spain. TAS was granted the rest of the world as its territory.

IG agreed to grant exclusive licenses to TG on all patents it then owned or thereafter acquired, methods and experience relating in any way to the manufacture or use of titanium pigments or compounds, as defined within the limits of the licensed field in said contract (Ex. C-2). "Licensed field" was defined as "all methods and processes in the field of manufacture of titanium compounds containing two per cent (2%) or more of the element titanium as well as the titanium compounds themselves". TAS was given the right to acquire such titanium pigments and compounds as it desired for sale in its territory from TG at cost. Such pigments or compounds so purchased by TAS could only be sold outside TG's territory. TAS granted an exclusive license to TG of all its then owned or thereafter acquired patents, methods and experience relating in any way to the manufacture or use of titanium pigments or compounds, as defined within the limits of the licensed field in said contract, for use in the territory assigned to TG. TG granted to TAS for its territory (the rest of the world exclusive of the territory allocated to TG) an exclusive license of its then owned or thereafter acquired patents, methods and experiences relating in any way to the manufacture or use of titanium pigments or compounds as defined within the limits of the licensed field in said contract.

Both TG and TAS agreed not to export titanium pigments into the territory of the other party without its consent and to impose the same obligations upon their customers.

TG and TAS each agreed not to import into the territory of the other party finished articles (e.g. paint, rubber, glass) manufactured by it; but to permit the importation of finished articles by customers purchasing titanium pig-

ments or compounds from it, subject to the limitations on imports of finished articles into North and South America under the agreement of 1920, Ex. A.

Both TAS and TG were allowed to grant to others licenses of their own or licensed patents provided the licensee or sub-licensee agreed to grant to the other party to the contract an exclusive license under all such licensee's or sublicensee's present and future patents relating to the manufacture and sale of titanium pigments or compounds for the territory of such other party (TAS or TG) and to exchange all technological experience and information and provided further that such licensee or sublicensee agreed to respect the exclusive territory of such other party and to assume the same obligations imposed by contract Exhibit C-3 on both TAS and TG with respect to imports and sales into each other's territory.

These arrangements were to run until 1957 and are automatically renewable for 10-year periods thereafter. They have not been cancelled by the parties.

After the execution of the contract Exhibit C, TG erected a factory for the manufacture of titanium pigments at Leverkusen, Germany, and the business was conducted in accordance with the provisions of these contracts (Exs. C to C-7, inclusive).

52. Prior to 1933, NL and Tinc believed that ICI and GW were planning to engage in the manufacture of titanium pigments and compounds in Great Britain, and ICI had begun development work preparatory to engaging in the manufacture and sale of titanium pigments and compounds. NL and Tinc were apprehensive of their competition, especially as ICI was a very powerful corporation,

although it had never manufactured pigments. Defendant Tinc was engaged in selling titanium pigments in Great Britain since 1928 to a modest extent. NL and Tinc entered into negotiations with ICI, GW and ISC to create BTP through which NL, Tinc, ICI, GW, and ISC would jointly engage in the titanium pigment business in the British Empire (exclusive of North America). Defendant Tinc on or about March, 1933, entered into the contracts (Exs. F to F-6, inclusive). Tinc agreed that it would not conduct any operations relating to the manufacture and sale of titanium pigments and compounds within the British Empire as defined in said agreements except through BTP; and ICI, ISC, and GW agreed to conduct any of their operations, relating in any way to the manufacture and sale of titanium pigments and compounds, anywhere through BTP exclusively. Subject to restrictions on transfer, the voting shares of BTP were distributed among Tinc—49% (with the right to allot 5% to R. W. Greef & Co., Ltd., which had been the British sales agent of TAS and, later, Tinc), ICI—17%, ISC—17%, and GW—17%. Tinc received the right to name three of the six directors, but it was stipulated that the chairman must be one of the directors named by the British shareholders. The agreement was for thirty years, with severely limited provisions for retirement. BTP was to confine all its operations relating to the manufacture and sale of titanium pigments and compounds to the British Empire, exclusive of any portions thereof within or appurtentant to North and South America. ICI, ISC, and GW each granted and agreed to grant to BTP an exclusive license, or where it was not entitled to do so, a non-exclusive license, to all its present and future patents, processes and subject matter within

the licensed field, defined to mean "all methods and processes in the field of the manufacture of titanium compounds containing two per cent (2%) or more of the element titanium as well as the titanium compounds themselves" (but limited in case of ICI to titanium oxide and titanium pigments); with the right to grant sublicenses; and each grantor agreed that it would supply BTP with copies of its applications for patents in the "licensed field" and, at the request and expense of BTP, would prosecute similar applications in countries designated by BTP.

It was agreed by Tinc and BTP that they would exchange licenses, patent applications, and technical information, and conduct their operations in and with reference to the British Empire (excluding Canada, Newfoundland, and certain other areas), in accordance with the principles of the 1920 agreement above described.

Tinc granted and agreed to grant BTP an exclusive license for the manufacture and sale of titanium pigments and compounds, in the territory allocated to BTP, under all its then owned or thereafter acquired patents, processes and subject matter within the scope of the licensed field. BTP granted and agreed to grant Tinc for the territory of Tinc (the rest of the world) a similar exclusive license of its present and future patents and subject matter within the scope of the licensed field. Both BTP and Tinc agreed not to export any titanium pigments or compounds into the territory of the other without the latter's consent, and further agreed to impose the same obligation upon their customers. Each party agreed not to import into the territory of the other finished articles manufactured by the former; customers of each and of exclusive licensees and sublicensees were permitted to make such importations pro-

vided the importation of such finished articles did not interfere substantially with the sale of titanium pigments or compounds by the other party in its own territory. Each party was allowed to grant sublicenses within its territory provided that neither party could grant licenses under its own patents or under any patents licensed to it under contract Exhibit F-1 unless the licensee or sublicensee agreed to grant to the other party to the contract (BTP or Tinc) an exclusive license under all the present and future patents of such licensee or sublicensee relating to the manufacture and sale of titanium pigments or compounds for the territory of such other party (Tinc or BTP) and unless the licensor (BTP or Tinc) required the licensee or sublicensee to agree to respect the territory of the other party and to impose upon such licensee or sublicensee all of the obligations imposed upon the other party (BTP or Tinc) with respect to the territory of the other in its contract Exhibit F-1. Tinc transferred to BTP all of its British Empire titanium pigment business pursuant to said contract. The contract Exhibit F-1 is by its term to run until 1963 and is uncancelled. The right of TAS to buy 50% of the TG production at cost (and more at cost plus 10%) having been transferred to Tinc, the latter agreed until such time as BTP commenced to manufacture, and for two years thereafter, to supply BTP's requirements at cost. TG supplied BTP with titanium pigments for its markets until BTP constructed a factory. BTP erected a factory for the manufacture of titanium pigments at Billingham and BTP became the largest manufacturer of titanium pigments in the British Empire. The defendant DP had knowledge of the negotiations between ICI and Tinc which culminated in contracts Exhibits F to F-6, inclusive. Tita-

nium was excluded from the Patents and Process Agreement of 1929 between DP and ICI.

53. In February, March, and April, 1943, there were conversations between representatives of NL and members of the Antitrust Division, Department of Justice, relating to a proposed consent decree. The conversations were suggested by the Division's pending investigation of the titanium pigments industry and antedated the indictment against the defendants herein and Messrs. Rockwell, Garesche, and Jebsen of NL, and another, returned in this District June 28, 1943. At a pre-trial conference in this case held October 30, 1944, counsel for NL tendered a form of contract agreed to, but not executed, by NL and the British companies. A copy of the proposed agreement was received in evidence at the trial, NL Ex. 30. The parties are ICI, ISC, GW, Tinc, BTP, and NL, and the proposed agreement provides in substance as follows:

(a) Licenses exchanged by BTP and NL (Tinc) will be non-exclusive and royalty free, with the right to grant non-exclusive sublicenses but only to parties who will license BTP or NL, as the case may be, on a non-exclusive, royalty free basis under the patents and applications of such sublicensees.

(b) The licenses will be without restriction as to production, shipment, sale, or use of titanium compounds; and it is provided that neither the 1933 British agreements nor the 1920 agreement will preclude BTP or NL (or Tinc) from manufacturing, selling, or using in, or from shipping from or to, any place in the world, titanium compounds or any product, finished or unfinished, or from otherwise fully exercising the grants made by them.

(c) It is agreed that the holdings of voting shares in BTP will be rearranged so as to insure that NL (or Tinc), ICI, ISC, and GW will each hold the same number of shares.

(d) The right of NL to name three directors of BTP is cancelled, and NL has agreed to refrain from taking any part in or exercising any influence in respect of deliberations or decisions of BTP concerning any business of BTP within, from, or to the United States.

(e) All restrictions on the disposition by NL of its shares of BTP contained in the 1933 agreements are cancelled, and it is agreed that the Articles of Association will be amended to remove therefrom all such restrictions.

(f) The proposed agreement supersedes, in so far as inconsistent therewith, the 1933 agreements, and to the extent that any provision or provisions of the 1933 agreements are inconsistent therewith they are deemed to be amended.

(g) The license agreement (Ex. F-1) between Tinc and BTP made in March 1933 is cancelled.

(h) The agreement for exchange of licenses under patent rights hereafter acquired may be terminated by BTP and NL at the end of any year by three years previous notice in writing, or by NL by notice given at any time pursuant to order of this Court, or by BTP by notice given at any time pursuant to order of competent authority in Great Britain pursuant to the Defense Regulations 1941 or pursuant to the order of any competent court in Great Britain.

54. Prior to 1936 local Japanese companies were planning to manufacture and sell titanium pigments and com-

pounds in Japan. NL, Tinc, IG, and TG believed that such Japanese companies would engage in exports which would lead to competition in all the markets of the world including the United States. KK had been agent for TAS and subsequently for IG in Japan. Tinc, TG, IG, Terres Rares, Thann, KK and Doitsu as trustee for Tinc, IG, TG, Terres Rares, and Thann entered into agreements (Exs. J to J-4, inclusive, which are uncancelled). KK was to own 50% of a new company, and of the remaining 50% Terres Rares 30% and Tinc 70%. IG was to have an option on one-half of Tinc's shares. TK was the new company created as a result of these contracts for the exclusive purpose of engaging in the titanium pigment business in the Japanese Empire, TK was assigned the Japanse Empire as its territory and the rest of the world was assigned through Doitsu, as trustee, to Tinc, IG and Terres Rares. TK was granted an exclusive license for its territory to manufacture and sell titanium pigments and compounds under all Doitsu's then owned or thereafter acquired patents, processes, and subject matter relating in any way to the manufacture of or use of titanium pigments and compounds, as defined within the limits of the licensed field in said contracts, that is, all methods, processes and apparatus in the field of manufacture of all titanium compounds, containing two per cent (2%) or more of the element titanium in a chemically, mechanically or physically combined state and mixtures thereof, which can be used as pigments, whether or not adapted for other uses and all such titanium compounds and mixtures which can be used as pigments, whether or not adapted for other uses. TK granted Doitsu, as trustee for Tinc, IG, TG and Thann a similar exclusive license of its present and future titanium pigment patents,

processes and subject matter relating in any way to the manufacture or use of titanium pigments or compounds, as defined within the limits of the licensed field in said contract. TK and Doitsu each agreed not to import titanium pigments and compounds into the territory of the other without the consent of the other and agreed to impose the same obligations upon its customers. TK and Doitsu agreed not to import into the territory of the other finished articles manufactured by it; and agreed to prevent such importation by customers purchasing titanium pigments or compounds from it if the importation of such finished articles interfered with the sales of titanium pigments by the other party in its own territory. TK was prohibited from granting sublicenses. Doitsu was permitted to grant sublicenses under any patents licensed to it by TK provided the sublicensee of Doitsu agreed to grant to TK for its territory an exclusive license under all present and future patents of the licensee or sublicensee relating to the manufacture and sale of titanium pigments and compounds, and provided Doitsu required the licensee or sublicensee to agree to respect the exclusive territory of TK and to assume the same obligations with respect to TK's territory as were imposed on Doitsu. TK was given an option on Blumenfeld's Japanese patents in exchange for certain rights to be given Terres Rares and Thann. The contract Exhibit J-1 is to run until 1960 and has not been cancelled by the parties. TG supplied the Japanese market with titanium pigments until the Japanese factory commenced production.

55. Contract Exhibit A allocated the Canadian and North American markets to NL as part of its exclusive territory.

56. NL owned certain Canadian patents and, by virtue of the 1920 agreement, had an exclusive license and the right to grant sublicenses under TAS's Canadian patents. Prior to the year 1934 Laporte was interested in erecting a factory in Canada to manufacture titanium pigments. NL and DP were selling titanium pigments and compounds in the Canadian market at this time. DP had contractual relations with CIL conferring certain rights and imposing certain obligations upon CIL with respect to patents and processes. NL and CIL entered upon negotiations which resulted in the making of four contracts (Pl. Exs. K to K-3, inclusive, which are uncancelled). DP and ICI had knowledge of such negotiations. There is no direct evidence that DP either approved or disapproved these contracts. I infer that it acquiesced in them.

(a) There was an agreement between CIL and NL dated January 1, 1937, under which a new company, CTP was granted the sole right to manufacture and sell under CIL's and NL's titanium patents in Canada and Newfoundland. CTP was to be owned 49% by NL and 51% by CIL. In addition, NL was to receive 8000 shares of non-voting (except under certain conditions) $100 par value stock in consideration of its existing good will, patents and technical information. NL and CIL agreed to subscribe to bonds of CTP for the purpose of erecting a factory; but because of World War II the bonds have not been issued and the factory has not been built. CTP was to have six directors, three nominated by NL and three by CIL; one of the CIL directors was to be president. Until the factory was built NL agreed to supply CTP at cost plus 10% and to use its best efforts to enable CTP to purchase from BTP at cost plus 10%. The agreement was to remain in force for thirty

years, and thereafter could be terminated on twelve months' notice by either party. If at the end of thirty years either party wished to withdraw from the agreement, it was required to offer its shares to the other party at book value. (In determining book value good will, patents, and future earnings were not to be considered.) CTP was to confine its activities relating to the manufacture and sale of titanium pigments and compounds to Canada as its exclusive territory. NL agreed to conduct all of its operations relating to the manufacture and sale of titanium pigments and compounds in Canada through CTP and CIL agreed that it would not conduct any such operations anywhere in the world except through CTP.

(b) CIL agreed to grant an exclusive license, throughout the world, to CTP under all its then owned or thereafter acquired patents, processes and subject matter, relating to the manufacture or use of titanium pigments or compounds.

(c) NL agreed to transfer its Canadian titanium pigment business to CTP.

(d) NL entered into contract Exhibit K-1 with CTP and granted to CTP, for Canada, an exclusive license on all of NL's patents, then owned or thereafter acquired, processes and subject matter relating to the manufacture or use of titanium pigments or compounds. NL was allocated the rest of the world as its territory. CTP granted to NL an exclusive license for the world outside of Canada, in respect of then owned or thereafter acquired patents, processes and subject matter relating to the manufacture, sale and use of titanium pigments, provided that NL was to grant to DP a non-exclusive license for North and South America under

any such patents licensed to NL by CTP. NL and CTP agreed not to export titanium pigments or compounds into the territory of the other without the consent of the other party and agreed to impose the same obligation upon its customers. NL agreed not to export into CTP's territory any finished articles manufactured by NL, and CTP made the correlated agreement. No such restriction was put upon their customers. CTP could grant sublicenses but neither party could grant licenses under its own patents or under any patents licensed to it under Exhibit K-1, (except NL to DP) unless the licensee agreed to grant to the other party to the contract (NL or CTP) an exclusive license under all its present and future patents relating to the manufacture or use of titanium pigments or compounds for the territory of such other party (CTP or NL) and unless such licensor (CTP or NL) compelled the licensee or sublicensee to agree to respect the territory allocated to the parties to the contract (CTP or NL) in Exhibit K-1 with respect to each other's territory. The contract is to run until 1967.

57. In 1935 NL agreed with CIL, BTP and Laporte to maintain prices on American titanium pigments sold by NL in Canada, above the prices charged for titanium pigments manufactured by BTP or Laporte and sold by BTP and Laporte in the Canadian market. This facilitated a price agreement between BTP and Laporte for the British Empire market outside of Canada. There is no evidence as to how long this agreement endured.

58. CTP acquired all of the titanium pigment business of Laporte in Canada in 1937 and said Laporte agreed to

refrain from engaging in the titanium pigment business in Canada until 1952.

BTP (with consent of NL), NL and DP severally supplied the Canadian market until 1939. Since 1939 CTP has acquired its products from DP and NL and will continue to do so until it builds a factory. DP sold its titanium pigment products in Canada prior to the creation of CTP to CIL and since the creation of CTP entirely to CTP. Negotiations are in progress among NL, CIL and CTP to revise the Canadian agreements on lines similar to the revised British agreements.

59. The defendants NL and TINC and their foreign associates, SIT, TG, BTP and TK, agreed in 1939 that, should patents relating to the titanium pigment business but outside the license field be offered by one of the parties to the other, the offer would be subject to the terms and conditions defined in the various contracts under the license field. NL and CTP agreed to extend their obligations to exchange patents, present and future, which in any way related to the titanium pigment business and to other matters, outside the license field on a reciprocal basis.

60. Each and every patent application of NL and NL's foreign associates SIT, TG, BTP, TK, CTP, which related to the licensed field as defined in the various agreements, was immediately available to each other on an exclusive, royalty-free basis under their respective agreements for the respective territories in which the companies operated throughout the world. The expenses of filing and securing said applications and patents were shared equally by the exclusive licensee in whose territory the application was filed and the patent owner.

61. After the outbreak of the present war in 1939 NL, Tinc, and TG believed that if the United States should be at war with Germany and as a consequence the United States Alien Property Custodian should seize the United States patents owned by TG and the German equivalent of the Alien Property Custodian should seize the German patents owned by Tinc and that if such patents were licensed to outsiders there might be competition in the respective markets allocated to the parties to Agreements A and C. NL, Tinc, IG, and TG in order to prevent such potential competion decided that all of the United States patents owned by TG should be transferred to Tinc and the Tinc patents in the exclusive territory of TG as defined in Exhibit C-3 should be transferred to TG provided that none of the other provisions of the several contracts were to be affected in any way. Thereupon TG assigned to Tinc some of its United States patents and applications and Tinc endeavored to transfer all of its German patents and other patents in TG's territory to TG.

62. Defendants NL and Tinc and their foreign associates TG, BTP and TK exchanged complete technical information which in any way related to the manufacture or use of titanium pigments or compounds as defined within the limits of the licensed field in their various agreements. Such information was of inestimable value in developing the business of these associated companies to the exclusion of potential newcomers in competition in the industry.

63. The defendants NL and Tinc and their foreign associates TG, BTP and SIT exchanged full and complete information relating to the sales prices of titanium pig-

ments and the activities of any other companies and potential competitors engaged in the titanium business in any of the markets of the world. Prices for the various markets in Europe were frequently fixed for all titanium pigments below which none of these associated companies was to sell in its respective markets without immediate notice to Tinc.

64. Each and all of the various contracts (Exs. A to A-2 inclusive, B, C to C-8, inclusive, F to F-6, inclusive, J to J-4, inclusive, and K to K-4, inclusive) has had the intended effect of (1) preventing competition among the various parties to said contracts within the exclusive territories allocated to the parties in their respective contracts; (2) creating a world-wide patent pool of many of the patents of commercial value relating to the manufacture of titanium pigments and compounds within the licensed field, as defined in said agreements in which said patents are made available only to the parties to said contracts; (3) creating a world-wide pool of useful technical information, relating to the manufacture and use of titanium pigments, available only to any of the parties to said contracts within their respective exclusive territories; (4) enabling the parties to said contracts outside the United States to facilitate the control of production and prices of all titanium pigments and compounds produced within their respective exclusive territories; (5) completely preventing any patent litigation among the parties (there has been no patent litigation in the titanium pigment field anywhere in the world); and (6) accelerating the spread of improvement in the product and processes throughout the world.

It is a fact, but I am unable to find whether or not it has a causal relationship to these contracts, that production

of titanium pigments has increased both in the United States and abroad [NL alone increased production from a nominal 500-1000 tons in 1920 to 76,788 tons, in terms of TiO_2 content, in 1944 and increased its sales so that in 1943 its sales of titanium pigment exceeded sales in the U. S. of lithopone, zinc oxide and white lead by all producers] and that the price has declined from 40¢ a lb. in 1927 to 14½¢ in 1944.

65. Joseph Blumenfeld, a chemist and managing director of Terres Rares, a French company in which he owned stock, in or about 1922 obtained certain patents relating to the manufacture of titanium compounds which he assigned to Terres Rares. Between 1922 and 1933 Terres Rares granted exclusive licenses to Thann, a French company, for France, its colonies, dependencies, protectorates, and mandated territories; to Montecatini, the largest chemical company in Italy, for Italy, and non-exclusive licenses for Belgium, Holland, Switzerland, Spain, Portugal, and South America, subject to rescission on three months' notice; to Aussig, the largest chemical company in Central Europe, for Czechoslovakia, Austria, Hungary, Yugoslavia, Rumania, and, subject to certain obligations, Danzig and Denmark, and non-exclusive licenses for Poland and Russia, and to Laporte for the British Empire. These were the only companies other than TG producing titanium pigments in Europe in 1933. These companies in 1933 were in competition with TG and BTP in the markets allocated to them by contracts Exhibits B, C, F.

66. Jebsen, acting for Tinc, either made or approved agreements among the European producers of titanium as follows:

(a) On November 23, 1933, Aussig and TG entered into an agreement, Ex. G, which established a sales quota of approximately 25% for Aussig and 75% for TG in Germany, Czechoslovakia, Poland, Austria, Hungary, Yugoslavia, Rumania, and Russia. Prices were to be fixed by mutual consent, and were not required to be identical, so that each firm could compete with dealers in other pigments (lithopone, zinc oxide, white lead, etc.) as local conditions might permit. Each gave the other the right to use its product patents, royalty-free, and agreed to support the other in protecting these rights, and to refrain from giving any technical information or aid to potential competitors; and the parties contemplated an agreement on process patents and experience. Aussig agreed to buy from TG at preferential prices any requirements of titanium pigments, above Aussig's then production capacity, which Aussig might need to meet its quota. Said contract was in effect from July 1, 1933, and there is no evidence that it has been cancelled and the effect of the war on its operation is undetermined.

(b) In June, 1935, but to take effect as of May 1, 1934, an agreement known as the Contrat a Quatre (Ex. G-1), was made between Thann and Terres Rares, on the one hand, and SIT and Tinc, on the other, which established a quota of 30% for Thann and Terres Rares and 70% for SIT and Tinc in Belgium, Holland, and "various countries" (Esthonia, Latvia, Lithuania, Abyssinia, Liberia, Arabia, Afghanistan, Persia, and Siam) and a 50% quota for each group in France; prices for these territories were to be fixed by mutual consent; product patents of each party were to be made available to the other parties royalty free.

All parties were to refrain from giving any technical information or aid to potential competitors. No new factories were to be built in the countries of the agreement outside France without the mutual consent of all parties. This agreement could be terminated by a change of sales possibilities resulting from governmental measures, from "new competition", or from "any governmental or legislative measures making it partly or wholly illegal". Otherwise it could not be terminated before December 31, 1938, and then only on six months' notice. There is no evidence that such notice was ever given. Thereafter it was to continue for two-year periods unless notice was given six months before the expiration of any such period. This agreement was related to the Contrat a Six (see below) and could be terminated on three month's notice if that agreement was terminated. There is no evidence that Contrat a Quatre was ever cancelled.

(c) At the same time, in June, 1935, an agreement known as the Contrat de Livraisons (agreement concerning mutual deliveries) was made between the same parties and provided that each group would supply the other with any titanium pigments which it might have available after its own needs were satisfied, at certain fixed prices and on certain terms. It was agreed that goods delivered by one group to the other could not be reexported and that this obligation must be imposed on the customers of the parties.

(d) An agreement known as the Contrat a Six, Ex. G-3, was also entered into at this time by Thann, Terres Rares, Montecatini, Tinc, SIT, and TG, in which territories were allocated and sales allotted on a quota basis, retroactive to May 1, 1934, thus: TG and Aussig were recog-

nized as enjoying exclusive rights of sale and delivery in Germany, Danzig, Czechoslovakia, and Russia; TG, Terres Rares, and Thann in Spain, Portugal, Japan, Switzerland, Bulgaria, Greece, Turkey, China, and South America (subject to TP's rights in South America); Terres Rares, Thann, and SIT in France; Terres Rares, Thann, and Tinc in Belgium, Holland, and "various countries" (as defined above); Montecatini in Italy; Tinc in Norway, Sweden, and Finland; and Tinc and Aussig in Denmark. Each party agreed to respect the others' exclusive rights. Each of the parties to contract Exhibit G-3 agreed to assist each other in preventing third parties from entering the titanium pigment business within their respective territories and each of the parties to contract Exhibit G-3 agreed not to reexport titanium pigments or products from the territories from which they had been ordered and delivered. Sales prices were to be fixed by mutual agreement. Use patent rights were exchanged between the parties on a royalty-free basis. Said contract Exhibit G-3 was in effect until December 31, 1938, when it was cancelled by Montecatini. The intention to continue to cooperate was expressed by the parties to contract Exhibit G-3 after its cancellation.

67. BTP entered into a price agreement with Laporte, in 1934, covering the sale of titanium pigments for the British Empire. Said price agreement is still in effect but has no application to the Canadian market from which Laporte withdrew in 1937. In 1941 BTP and Laporte entered into a quota agreement whereby a quota (Pl. Ex. F-8) of the titanium pigment business in the British market was allocated to each of the said parties. This agree-

ment is uncancelled. Laporte is obligated, by agreement with Blumenfeld, to refrain from exporting titanium pigments to any territory outside of the British Empire and has refrained from making such exports outside the British Empire since 1937.

68. Each and all of the said contracts, Exhibits G, G-1, G-2, G-3, F-8, has and have had the intended effect of helping Tinc and NL to prevent any exports of titanium pigments or compounds to the United States.

69. Defendants NL and Tinc and TG, represented by Jebsen, McCarty and Kuhne, commenced negotiations with CP and the other Blumenfeld companies represented by Blumenfeld, Ticknor, Chase and Burton, to eliminate competition and also to facilitate exchange of technical information and patent rights between the two groups producing titanium pigments in all markets of the world in 1930. The parties believed that no agreement eliminating competition between the two groups in markets outside of the United States and to achieve the other desired ends could be reached unless the parties thereto considered themselves secure against competition from American producers. A tentative understanding had been arrived at between NL's foreign associates and the Blumenfeld interests outside the United States in March, 1931, involving both a technical and commercial cooperation consummation of which required assent of NL in some respects. The negotiators were of the opinion that the making of such an agreement would be facilitated if there were an agreement for technical cooperation between NL and CP. The agreements mentioned in Findings 66 and 67 were essentially for commercial not technical cooperation.

70. By 1931 the titanium pigment art in the United States was already developed. Patent positions were claimed by both NL and CP, the then only existing manufacturers. DP's efforts initiated prior to that time to develop, through research, an independent patent process were still unsuccessful and substantial additional expenditures and time would have been required to complete the program and DP became convinced that if it were to enter the manufacture and sale of titanium pigments as a development of its white pigment business it would be necessary to get into the business as promptly as possible through the acquisition of the patents and the going business of CP.

71. After the purchase of CP by Krebs in July, 1931, defendant NL represented by Jebsen, McCarty, Thompson and Beschorman, and Ticknor and Chase, directors of Krebs until the end of 1934 (the latter two without authority from DP), continued negotiations to reach a world-wide agreement which would eliminate competition in the manufacture of titanium pigments and compounds. Blumenfeld continued to represent the Blumenfeld group exclusive of Krebs. The parties to these negotiations continued to seek means whereby the European producers could be secure against competition by DP or Krebs.

72. DP knew of plans to combine all the European titanium producers and was willing to give its aid to NL in bringing about a patent exchange among the European producers in order to secure one in the United States with NL. NL wished to pool with DP all their patents and technical information relating to the manufacture or use of titanium pigments in the United States in order to settle

its patent controversies with DP and to obtain access to DP's patents and technical facilities and jointly to control and dominate the manufacture and sale of titanium pigments and compounds; and DP had knowledge of this wish. NL had threatened but failed to file suit on any claims it may have had for any alleged infringements of patents owned or controlled by it against CP prior to July 1, 1931. The defendant DP knew at the time it acquired the business of CP in July, 1931, that NL had failed to enforce any claim it might have against CP for any alleged infringement of any patents relating to the manufacture and sale of titanium pigments or compounds which were owned and controlled by TP. Both NL and DP in good faith claimed that each infringed certain of the other's titanium pigment patents and both in good faith denied such infringement claiming, among other things, that the patents alleged to be infringed were of doubtful validity. NL and DP agreed in October, 1932, that the validity of the patents claimed to be infringed should not be questioned except as a last resort and that they should try to arrive at a general understanding. NL advised DP of its contracts with TAS in May of 1932 and of the restricted nature of said license agreements. TP did not own the legal title to 7 of the 9 patents it claimed were infringed by Krebs in 1932; but it held licenses thereunder with the right to grant sub-licenses thereunder subject to the contract of 1920. Krebs did not check the legal title to the patents NL alleged it infringed because it considered that under the agreement with NL (Ex. E) it was obtaining rights under all patents involved in the discussions of patent infringement between it and NL. Both TP and Krebs began to

exchange extensively technical information relating to the manufacture and use of titanium pigments in 1932 and the information so exchanged related to much more than any alleged claims of patent infringement by either company. Blumenfeld and his foreign associates furnished technical aid and assistance to Krebs at its instance from August 1931 until the approximate date at which TP and Krebs commenced the exchange of technical information in 1932. Krebs did not unequivocally notify Blumenfeld of its position that it intended to make no agreement with Blumenfeld or Terres Rares for exchange of patents or information until after contract Exhibit E had been approved by NL's foreign associates and executed by TP and Krebs. Krebs never exchanged patent or patent applications with Blumenfeld and did not furnish Blumenfeld with any technical information.

73. In 1933 TP and Krebs were the only producers of titanium pigments in the United States.

Contract Exhibit A by its terms prevented TP from entering into a contract with Krebs unless Krebs subscribed to the provisions of Article 14 of Contract Exhibit A and particularly unless Krebs agreed not to export into the territories of NL's foreign associates and unless Krebs agreed to grant exclusive licenses to NL's foreign associates under all its present and future patents for titanium pigments and compounds in the territories of the foreign associates.

After extensive negotiation NL and DP formulated an agreement in writing later executed on August 28, 1933, and dated as of January 1, 1933, which is in evidence as Exhibit E. The agreement Exhibit E provided:

1. The parties were TP and Krebs.

2. The licensed field was defined as

> "(1) All methods, processes and apparatus in the field of manufacture and use of all titanium compounds, containing two per cent (2%) or more of the element titanium in a chemically, mechanically or physically combined state, and mixtures thereof, which can be used as pigments, whether or not adapted for other uses, and (2) all such titanium compounds and mixtures which can be used as pigments, whether or not adapted for other uses".

3. TP granted Krebs (a) a non-exclusive license to use within the United States, its colonies and possessions, and for the licensed field, all processes and apparatus of manufacture, patented or not, which it then used or thereafter used during the term of the agreement, and as to which it was free to grant such license; (b) a non-exclusive license to exploit within the same territory and for the licensed field all U. S. patents then or thereafter owned by it during the term of the agreement; and (c) a non-exclusive license to sell the products resulting from such processes in the U. S., its colonies and possessions, Mexico, Central America, West Indies and South America.

4. Krebs granted the identical rights to TP.

5. Both parties agreed to exchange technical information including patent applications and the aims and results of their research and development work.

6. Each party agreed to help the other obtain a non-exclusive license for the mentioned territory under any U. S. patent under which the other was licensed.

7. Krebs agreed to give TP's foreign associates the first opportunity to acquire from Krebs a non-exclusive license under any patent issued in Europe or Great Britain within the license field, at the disposal of Krebs.

8. The contract was subject to cancellation after December 31, 1933, on three years' notice.

9. The parties released each other from claims for infringement of the U. S. patents then owned or thereafter during the term of the agreement acquired with right to sue for past infringement. Each of the parties also released the customers of the other from past infringement claims.

10. Mutual royalties which could not exceed a total of $40,000 by either party were provided for and no royalties were to be paid by either party after 1936. (And such royalties were paid).

IG objected to this proposed agreement upon the grounds that it failed to provide that Krebs (a) shall not manufacture in TG's territory; (b) shall not sell in TG's territory; (c) shall require its customers not to sell in TG's territory; (d) shall not grant sub-licenses except to enterprises outside TG's territory and for use outside TG's territory; (e) shall not exchange experience except with the same limitations,

> "as otherwise the unbearable situation may arise for the T.G. that Krebs competed with T.G. in the latter's territory, with T.G.'s own patent rights and experiences which are transmitted to Krebs through T.P."

In an effort to overcome this obstacle to the making of the agreement of Exhibit E, C. H. Rupprecht, President of Krebs, now deceased, had conversations with W. C. Beschorman, Executive Vice-President of NL.

Rupprecht told Beschorman to make IG realize that they (IG and TG) were putting their interests in NL's hands and that they would be well taken care of; that the anti-trust laws made impossible the incorporation into the agreement of such provisions as IG desired. He also pointed out (a) that the license granted by Exhibit E contained a territorial limitation which excluded TG's territory from the scope of the license; (b) that DP was not then interested in the business of exporting to TG's territory or of manufacturing in TG's territory; (c) that DP had a general policy of not granting licenses which were exclusive as to DP. . . .

In order to assist further in persuading IG to withdraw its objections, Krebs, on June 28, 1933, delivered a letter, drafted by its counsel, to NL for transmittal to IG. In that letter (Pl. Ex. 267)* DP (1) expressed its desire

CONFIDENTIAL

W. C. Beschorman, Vice Pres.,
National Lead Company,
111 Broadway,
New York City, New York.

Dear Mr. Beschorman:—

We have considered the various points raised by I. G. in their cable to you with the desire, if possible, to comply with its request.

to comply with IG's request if possible; (2) stated that the antitrust laws prevented DP from making any commitments respecting the territories of TG and Tinc; (3) called attention to the territorial limitation in the proposed license agreements and stated that with such limitation, "we think the result will be eminently satisfactory to your foreign associates"; (4) stated that legally and practically there was

---

"As you are aware, the Anti-Trust Laws of this country definitely prevent this Corporation from making any commitments respecting the territories of Titangesellschaft and Titan Inc. Further, these several companies are not parties to the Krebs-Titanium Pigment Agreement and so, as to them, we are unable to make any direct commitment. However, since Article II of the Krebs-Titanium Pigment Agreement definitely provides that Krebs is limited both in respect to use and sale to the territories set forth in this Article, we think the result will be eminently satisfactory to your foreign associates. As to controlling the disposition of our products by our customers, we are sure you appreciate the difficulty both from a legal and practical standpoint.

The I.G. request that Krebs grant no sub-licenses or technical aid to others in the territories of the foreign companies, is tantamount to obligating Krebs to grant exclusive licenses. The whole agreement, you will recall, for definite reasons, was placed on a non-exclusive basis. Since all licenses received by Krebs under its foreign patents, are subject to negotiation, we believe there will be no difficulty in working out a solution that will be acceptable to all parties; it may well be that such negotiations will result in exclusive licenses to your foreign associates. Naturally, we shall treat technical information in the same manner as our patents.

The present form of our Agreement is the result of much care and thought on the part of both parties. It embodies, as we see it, a practicable working basis for both companies, as well as for your foreign associates.

Very truly yours,

President

CHR:s

great difficulty in controlling its customers in the disposition of its products; (5) refused to bind itself not to license others than TG in TG's territory; but expressed the belief that in the prospective negotiations for any foreign patents owned by DP a solution would be worked out which would be "acceptable to all parties; it may well be that such negotiations will result in exclusive licenses to your foreign associates", and that exchange of experience would be treated in the same manner as patents.

On July 21, 1933, after further conversations between Rupprecht and Beschorman and also between Rupprecht and Jebsen, Beschorman sent a letter dated July 12, 1933, transmitting the Krebs letter of June 28th. In his letter of July 12th (Pl. Ex. 273)* Beschorman wrote (1) experience

---

*

July 12, 1933.

I. G. Farbenindustrie
Aktiengesellschaft
Frankfurt (Main)
Grüneburgplatz

Dear Sirs:

Immediately upon receipt of cablegram of June 22nd from Dr. Jebsen, copy of which is attached, we took the matter up with the Krebs Pigment & Color Corporation, submitting to them a copy of the cable, and take pleasure in handing you copy of their reply under date of June 28th. Careful reading of the Krebs letter will surely indicate to you the spirit in which they are entering into this contract and their efforts to meet your views. We feel that experience will prove that such will be the case.

In regard to the phrase "non-exclusive license" to which you call our attention as occurring in Article 5, Paragraph 2, we have to refer to the United States Anti-Trust Laws which absolutely forbid the granting of exclusive license between two manufacturers in the United States as such a practice would tend to create a monopoly. Therefore, the use of this phrase "non-exclusive license" is simply to comply with the United States Laws

will prove that Krebs is trying to meet your views; (2) the use of the phrase "non exclusive license" in Article V of

---

and in practice the licenses under each others patents will undoubtedly prove to be, to all intents and purposes, exclusive.

Referring subseqently to the points brought out in your letter of June 20th, under A, B, C, D and E, you will note that the Krebs Company consider themselves limited both as to use, manufacture and selling to the territory granted to them by the agreement. While this agreement do not specifically prevent Krebs from exporting into your territory any products not manufactured under the patents of the Titanium Pigment Company and its associated companies, it will be a difficult matter to discriminate between such manufacture and manufacture under their patents and maintain close and good co-operation, and the practical effect will be that Krebs will refrain from such export.

As to exports by clients of the Krebs Company, we note that Krebs will use all their efforts to prevent any export outside of their territory which would cause any trouble to you in any way.

In regard to licenses, although non-exclusive licenses are specified throughout the agreement, you will note from the letter of Krebs Company that they are not adverse to granting exclusive licences in case this may be found desirable by you. Under the practice, as we foresee it, these licenses will be given against a nominal payment except in cases of outstanding development.

We also see your point, that by the exclusive license you have given Titan Co. Inc., which has granted exclusive licenses to the Titanium Pigment Co. Inc., you are not in position to trade with Krebs regarding any American patents belonging to you. However, you may rest assured that your interest in these respects, which are also our own interests in view of our part ownership in the Titangesellschaft, will be fully and completely looked after.

At one time we considered the question of an agreement between the Titangesellschaft and Krebs covering the points in your letter, but have dropped this idea as we felt that you would be better served to have us look after your interests than to complicate the situation with a separate contract.

The only other point in your letter which we do not believe has been covered is your suggestion that the contract be changed from termination in three years to termination in five years. Frankly, there is no possibility of the contract being terminated at any time that we can foresee, and I am glad that you did not make any especial point of this either in the cable or in your letter of June 20th.

the Agreement is simply to comply with the anti-trust laws and in practice the licenses will prove to be, to all intents and purposes, exclusive; (3) while the agreement does not specifically prevent Krebs from exporting into TG's territory products not manufactured under TP patents, it will be difficult to discriminate between such manufacture and manufacture under their own patents and maintain close and good cooperation, and the practical effect will be that Krebs will refrain from such export; (4) Krebs will use its efforts to prevent export by its customers; (5) NL will look after your interest in these respects—a method preferable to making a direct contract between Krebs and TG.

A copy of Beschorman's letter of July 12th was, before it was sent to IG, shown to Rupprecht and on July 17, 1933, a copy was sent to him for Krebs' records.

There is no evidence that Rupprecht remonstrated against the sending of Beschorman's letter to IG. Krebs and DP through Rupprecht acquiesced in and ratified the assurance made by Beschorman to IG as to territorial delimitations of the titanium pigment business. In acquiescing in such assurance that DP would not manufacture in or sell in TG's territory, DP was not making a promise; it

---

May I add that we certainly appreciate your attitude and the views you have put forward in your letter to Dr. Jebsen and trust that you will not be disappointed in the future by following the lines we have suggested. May we ask for further advice from you as to whether the Krebs letter and above make the whole matter satisfactory.

Very truly yours

Exechtive Vice President.

Copy to—Dr. Kuhne
Dr. Jebsen
Mr. Rupprecht
Mr. Tasker, Vice Chairman, British T.P.Co.

was doing no more than giving expression to its then existing policy not to manufacture or sell in Germany and other TG territory. DP's aforesaid assurance in part formed the consideration for continued abstinence of the European producers from exporting to the United States.

IG construed the communications to mean that Krebs "will loyally respect the territorial deliniitations as regards manufacture, granting of licenses and sale, which are fixed in the agreement" between Tinc and TG; and in reliance thereon, withdrew its objections to the agreement Exhibit E. There is no evidence that the aforesaid construction was communicated to DP.

DP did not agree with TP or NL that it would refrain from exporting titanium pigments into TG's territory; but it assured TP and NL that, as a practical matter, such exports would not take place.

DP did not agree with TP or NL that it would grant NL's foreign associates exclusive licenses under DP's foreign patents; but it gave assurances that the practical effect of its conduct would produce substantially identical results as if it did so agree.

Tinc and NL's other foreign associates approved the agreement between TP and Krebs on the basis of the DP assurances.

NL agreed with DP that all of NL's titanium pigment business would be done exclusively through TP, and DP agreed with NL that it would only engage in the titanium pigment business through Krebs. The conduct of DP of its titanium business after January 1, 1936, through the Krebs Division of DP did not breach or violate this agreement or any assurance previously given by DP through Krebs.

DP, through Rupprecht and Krebs, by these assurances and Exhibit E, joined the conspiracy found herein to exist between, NL and its foreign associates. DP's status rights and obligations were different from those of the other members of the combination. DP did not thereafter withdraw.

In July, 1933, Blumenfeld conferred with Rupprecht, President of Krebs, and the former requested Krebs to agree not to export into the territory of the European producers so as to facilitate the making of an agreement for commercial cooperation among the European producers. Rupprecht stated that he would make no such agreement but he explained to Blumenfeld that DP was not interested in the export business.

Neither Krebs nor DP exported any titanium pigments to the territory of TG, BTP, SIT, TK, Terres Rares, Thann, Aussig or Montecatini.

In 1936, DP received an order from BTP for 50 pounds of titanium pigment. Rupprecht telephoned the President of NL and advised that he was sending the requested merchandise as a free sample, "not wanting to have any question raised about * * * selling outside the United States".

74. Blumenfeld's foreign associates, Terres Rares, Aussig, Thann and Montecatini imported no titanium pigments or compounds into the United States.

75. DP and NL exchanged technical information relating in any manner to the manufacturing or use of titanium pigments or compounds from about April, 1932, until April, 1940.

As of about May 1, 1940, the exchange of technical information between NL and DP was discontinued; and the

1933 agreement between TP and Krebs, which had been assumed by NL and DP, respectively, was, by an agreement between NL and DP dated January 1, 1941, (Ex. E-3) amended to eliminate provisions for exchange of technical information.

76. The aforesaid agreement, Ex. E, was further amended to include extender pigments, theretofore included by implication and practice. The agreement, Ex. E, as thus amended has not been terminated.

77. From August, 1933, to January 1, 1941, all patents and patent applications owned or filed by TP, NL, Krebs or DP which in any way related to titanium pigments or compounds within the licensed field of contract Exhibit E, were immediately available to each other on acquisition or filing. From and after January 1, 1941, all United States patent applications of either NL or DP were made available and still are available for the use of the other company after six months from the date of the filing of applications. All United States patents issued to or acquired by either DP or NL within the licensed field from and after January 1, 1941, continued to be and still are available to either company on a royalty-free basis immediately on issue or acquisition.

78. From 1933 on there was active competition between NL and DP for customers. There has been a vast increase in sales; and repeated reductions in the price of titanium pigments have taken place and a very few increases. DP entered the titanium pigment business in 1931 and since that date it has made frequent plant expansions for the manufacture of pure and composite TiO_2

and its production increased from 20,027 tons in 1935 to 50,674 tons in 1941 and then decreased to 42,843 tons in 1943.

NL and DP have endeavored to match each other's titanium products; but each also manufactures certain titanium pigments having special applications not manufactured by the other.

There is no allocation of territory or customers between NL and DP; and each maintains a large, highly trained technical sales force engaged in endeavoring to sell titanium pigments. To a very large extent the salesmen of the two companies are chemists whose contact with consumers (that is, manufacturers of paint, rubber, glass, etc.) consists in endeavoring to demonstrate that their products merit acceptance on the basis of technical superiority. The buyers of titanium pigments are mainly well-informed, experienced purchasing agents. NL and DP sell for identical prices; there is no evidence that such price identity is the product of agreement or collusion.

79. In entering into the agreement, Ex. E, NL had several purposes:

1) For about a year prior to the making of Ex. E officials of NL had been concerned by the early expiration dates of many of the patents upon which NL relied. By exchanging patents and technology with DP, a large and powerful corporation, possessed of great research facilities, NL expected to strengthen the patent monopoly of NL and DP jointly, as against newcomers in the titanium pigment business.

2) NL intended by its agreement with DP to avoid the expense and the risks of patent litigation and to obtain

access to the Blumenfeld patents and DP's research capacity.

3) NL expected to obtain the benefits of a friendly and cooperative competitor rather than that of a hostile competitor.

4) From the assurances given by DP on the request of IG, NL expected to obtain freedom from interference by DP in the arrangement made with the European producers.

DP's purposes in entering into the agreement Ex. E were:

1) To avoid the expense and risks of patent litigation.

2) To avoid the research expense in trying to avoid infringement of NL valid patents.

3) To obtain access to NL's technical experience and patents in the titanium pigment field as well as the patents and the experience of NL's foreign associates.

4) To strengthen its own patent position in the titanium pigment field to the exclusion of others than NL by pooling its patents with NL.

The necessary effects of the agreement Ex. E. and of DP assurances have been

1) The achievement of NL purposes.

2) The achievement of DP's purposes.

3) To give NL and DP together domination and control over the titanium pigment business in the U. S.

4) To remove obstacles from the execution of the TG-Aussig agreement—Ex. G, the Blumenfeld agreements G-1, G-2, G-3, the Japanese agreement Ex. J, the Canadian agreement Ex. K and the price agreement between BTP and Laporte for the British Empire.

5) A proliferation of patents.

6) To restrict and obstruct exports from the U. S. outside of Western Hemisphere.

7) To restrict and obstruct imports into the U. S.

8) To settle the existing and potential patent disputes and to promote the more rapid development of the titanium business and a greater freedom of action for the parties under titanium pigment patents and developments.

80. In 1934 defendants NL and DP jointly purchased the Leuchs patent relating to the manufacture of titanium pigments each contributing one-half of the cost. Shortly thereafter DP acquired NL's half interest and granted NL a non-exclusive license thereunder royalty free. At time of purchase NL's technical director advised that in his opinion the patent was invalid but he thought it might anticipate a Blumenfeld patent. The patent was reissued with broader claims. Said patent was never used by either DP or NL. The patent was included among those licensed to VC and Zirconium.

81. In 1939 National Lead undertook to adapt a patented machine known as the Micronizer Reduction Mill for use in the manufacture of titanium pigments. Following developments and changes by NL, the machine proved of substantial value as a means of improving the texture of

titanium pigments; and NL secured an exclusive license (Ex. P), with the right to grant sublicenses, for titanium pigments manufacture, from the patentee, International Pulverizing Corporation. NL granted DP pursuant to Ex. E the non-exclusive right to use this apparatus on the same terms and conditions as those granted to NL under its exclusive license from International Pulverizing Corporation. The license from NL to DP was granted at about the same time NL secured an exclusive license from International Pulverizing Corporation to use this apparatus. DP regarded this apparatus essential to enable it to make a pigment comparable to one produced by NL, which was using the apparatus. At its request Zirconium was granted by NL the right to use this apparatus about eighteen months later on the same terms and conditions as DP. NL refused a license of the "Micronizing Apparatus" to VC and Sherwin-Williams Company, who also desired to use this apparatus. In October, 1944, NL relinquished its exclusive license and took a non-exclusive license.

82. DP's method of doing business was to sell titanium pigments to manufacturing consumers. The form of sales contract used by DP contained the phrase "for the buyer's own consumption." The evidence does not establish that this phrase was used pursuant to any agreement with NL, rather than that it was used to express a usual term of a requirements contract.

NL's form of sales contract in 1939, 1940, 1941 and 1942 contained an identical clause.

There is evidence that such a clause is common in the chemical industry and that DP had employed it before the 1933 contract.

83. The only licenses granted by DP of any of its titanium pigment patents were the licenses described herein. No other company or person ever requested such a license from DP.

84. Early in 1934 Zirconium, which was owned by Glidden Company and by Metal and Thermit Corporation in equal shares, began to manufacture titanium dioxide. It owned some patents relating to such manufacture which it had acquired from its parent corporations. On January 8, 1934, DP notified Zirconium that such manufacture might infringe patents owned by DP. Negotiations ensued which resulted in a license agreement from DP to Zirconium dated January 1, 1935, and signed on August 19, 1935, Ex. I. Thereby DP granted Zirconium a non-exclusive license under specified patents, for the life of the patents, subject to the payment of a royalty on *all* TiO_2 produced and subject to a limitation on tonnage of 3,000 tons in 1935, to 9,000 in 1944 and thereafter, of titanium dioxide produced under the license.

On March 7, 1943, DP licensed Zirconium under additional patents without additional royalty. On November 10, 1944, the tonnage limitations were cancelled. DP has collected in royalty from Zirconium $196,655.86 to July 1, 1944.

On May 17, 1934, NL sent a notice to Zirconium of probable infringement. Negotiations followed which resulted in an agreement dated May 6, 1935, Ex. H, whereby NL in lieu of royalties received 10% of the stock of Zirconium, had its president elected to Zirconium's Board of Directors and NL and Zirconium cross licensed each other under all patents in the titanium pigment field, then owned

or thereafter acquired, and both parties agreed to exchange technical information and experience. Zirconium assumed obligations substantially like those of Article XIV of the 1920 agreement, Ex. A, including restriction on its exports. The agreement was to endure until August 7, 1951.

NL became discontented with the management of Zirconium. Glidden and Zirconium were dissatisfied with NL's refusal to invest more money in the development of Zirconium.

In April, 1944, the agreement was cancelled, the parties exchanged releases and NL assigned its shares of Zirconium to Glidden.

Zirconium produced only pure TiO_2. From May 6, 1935, to July 1, 1944, its total production was 33,667 tons. NL did render some engineering assistance to Zirconium in connection with the installation and use of its processes and imparted some technical information but frequently it refused to convey such technology to Zirconium on the ground that it was prevented by other agreements from so doing.

In the Spring of 1935 there was a conversation between Rupprecht for DP and Beschorman for NL respecting Zirconium's patents. The evidence does not show what the conversation was.

On occasions before 1940 there was exchange of information between DP and NL relative to Zirconium's production. The evidence does not warrant the inference that the licenses granted by DP to Zirconium and the cross licensing agreement between NL and Zirconium were made pursuant to a common plan of NL and DP or as a result of concerted action by them.

The necessary effect of the two agreements was to restrict the domestic production and foreign exports of Zirconium.

85. VC was organized in 1935 to manufacture titanium pigments in the United States.

On November 19, 1936, DP notified VC of its patent holdings in the titanium field and suggested conference. Negotiations followed and resulted in an agreement, Ex L, executed August 5, 1937.

By this agreement DP granted VC a non exclusive license under a specified list of U. S. patents subject to royalty payment on all production of TiO_2 and subject to limitation on the quantity produced under the license ranging from 3000 tons of TiO_2 content for the year 1937-8 to 9,000 tons for 1946 and any year thereafter. VC granted DP a non exclusive, royalty free license under a named patent.

In November, 1940, DP granted VC a similar license under another patent in this field for an additional royalty.

On July 22, 1943, DP granted VC a similar license under its patents for rutile pigments, without additional royalty.

In November, 1944, DP cancelled the quantity limitations in the licenses.

VC paid DP in royalties to July 1, 1944, $193,875.24.

VC produced only pure TiO_2. VC's total tonnage from August 5, 1937 to June 30, 1944, was 36,576 tons.

The necessary effect of this license was to restrict the production of VC.

Early in 1937 NL and VC discussed the possibility of VC infringing NL patents in the titanium field.

Extensive negotiations ensued which did not result in agreement. During these negotiations which extended over several years, VC was willing in 1938 to make an agreement for a reciprocal exchange of licenses and ex-

perience on a royalty free basis. NL desired VC to pay a 2% royalty which VC refused. NL explained its obligations under Art. XIV of the Agreement Ex. A, and was concerned about "the manner of expressing" the obligation of VC not to compete with NL foreign associates, in view of the anti-trust laws.

In a communication to Jebsen on September 13, 1938, NL adverted to this problem and stated that "in this case" a purely verbal understanding was not desirable. Mr. Jebsen replied that the foreign associates would not welcome a verbal understanding, "in the present case".

NL has not instituted any action against VC to enforce its claim of infringement.

There is no evidence that the action of NL and DP with respect to VC was the result of agreement between NL and DP.

86. After the execution of Exhibit E, representatives of DP and NL's foreign associates enjoyed the privilege of visiting each other's titanium pigment plants and obtaining any and all technical information desired by either as regards plant operations and plant equipment from August, 1933, to September, 1938. This exchange was a matter of courtesy and not of agreement; but it was a courtesy DP and NL's foreign associates expected to receive. Similar courtesies were refused to a representative of Aussig.

An exchange of technical information was also agreed upon in principle between DP and NL's foreign associates on June 8, 1938, but not in detail, but this was repudiated by Rupprecht on September 16, 1938. No experience was ever exchanged pursuant thereto. DP continued agreeable to permit plant visits from the representatives of NL's for-

eign associates, but excluded all research and development information from said exchange arrangement. NL and DP were not exchanging this type of technical information at that time.

The 1933 agreement between TP and Krebs (Ex. E) and the evidence relating thereto does not distinctly disclose what rights and obligations Krebs acquired and assumed with respect to Tinc through TP; specifically, whether Krebs acquired from TP a sublicense to Tinc U.S. patents, and the right to receive Tinc's experience (obtained from TG) conveyed to TP.

Upon the trial NL stated that Krebs obtained by the 1933 agreement sublicenses to all the U. S. patents available to NL, although in 1934 Jebsen claimed that this did not include the United States patents of TAS and Tinc. At the trial DP claimed that by virtue of the 1933 agreement Krebs acquired sublicenses to the U. S. patents of TAS and Tinc provided such patents were then "used" by TP.

The language of the 1933 agreement does not contain a restriction of the grants to patents "used".

The labelling of its products by Krebs immediately after the execution of Ex. E indicates the belief of Krebs that it did obtain sublicenses under at least some Tinc U. S. patents.

87. DP's first offer to NL's foreign associates of a license under Article V of Exhibit E covered the "Ti-Tint" patent application filed in the United States by DP in 1934. The royalties asked by DP of NL's foreign associates for its proposed license were unsatisfactory and no patent application covering this invention was ever filed in any foreign country by DP or NL's foreign associates. In 1935 DP filed applications for foreign patents on its Blended Pig-

ments invention, upon which various foreign patents issued. These were the only titanium pigment patents filed by DP in the territory of NL's foreign associates without their specific request for filing. DP granted royalty-free licenses to NL's foreign associates on such patents and applications exclusive except as to DP and ICI. All expenses for maintaining (but not for securing) such patents were paid by NL's foreign associates.

88. The foreign associates of NL desired a general arrangement covering the exchange of patents between DP and themselves in order to eliminate the details of negotiating licenses of specific patents in specific agreements as required by Article V of Exhibit E. The contract between Blumenfeld, Terres Rares and CP provided for the exchange of future patents and technical information relating to the manufacture and use of titanium pigments between CP, Terres Rares, and its associated companies engaged in the manufacture and sale of titanium pigments outside the United States. Before 1933 Krebs disclaimed any obligation to Terres Rares and Blumenfeld under the CP, Terres Rares, Blumenfeld contract. In 1935, Krebs stated that it did not wish to enter into a general cross-licensing agreement with the foreign associates of NL until it was reasonably certain that it would have no further difficulties with Terres Rares and Blumenfeld under their contract with CP.

89. Negotiations for a general exchange of patents continued between DP and NL's foreign associates in 1938. DP refused to make a written general agreement for the exchange of licenses on present and future patents between

itself and NL's foreign associates because of the United States anti-trust laws. An oral understanding was reached between DP and NL's foreign associates on June 8, 1938, whereby each of said parties agreed to exchange such of its patents and applications as related to the manufacture and use of titanium pigments within the licensed field of Exhibit E with each other as might be desired by each from the other. Such of each other's patents and applications as were desired by DP and NL's foreign associates were to be licensed on a royalty-free basis in separate annual license agreements. Licenses so granted by DP to NL's foreign associates were to be exclusive except as to DP and in England as to ICI. Rupprecht expressed to NL and Tinc the view that the reservation was in fact without practical importance. All licenses granted DP by NL's foreign associates were subject to the approval of NL and were non-exclusive. All expenses for filing and maintaining DP patents in territories of NL's foreign associates were paid for by the foreign associates in whose territory the patent applications were filed.

90. DP acting in accordance with said oral understanding of June, 1938, granted royalty-free licenses to Tinc with the right to sublicense NL's foreign associates on June 20, 1938, April 21, 1939, May 10, 1940, and June 23, 1941 (Pl. Exs. N, Q, R, S, which licenses are uncancelled), and continued to make available to NL's foreign associates on a royalty-free basis all patent applications filed by it in the United States relating to the manufacture and use of titanium pigments until a short time before the transmission of such applications was made dependent on the securing of governmental permission. NL's foreign associates act-

ing in accordance with said oral understanding of June, 1938, made all of their United States patents and patent applications relating to the manufacture and use of titanium pigments available to DP and via Tinc entered into cross licensing agreements with DP (Pl. Exs. Q, R and S) in 1939, 1940 and 1941. Certain patents and applications obtained under these agreements by DP were of significance to DP's operations. No licenses under the applications of NL's foreign associates were granted to any other producer in the United States, except NL and DP. No licenses under the patents of NL's foreign associates were granted to any producer in the United States, except NL, DP and Zirconium. All of said license agreements were granted with the consent of NL. The licenses granted to NL's foreign associates by DP in Exs. M, N, Q, R and S on any patents issued in the name of DP in the territories of the foreign associates of NL were and are exclusive except for a reservation in favor of DP and ICI. Neither DP nor ICI ever made or attempted to make any use of said patents or applications in the territories of NL's foreign associates. The exchange of DP patent applications with NL's foreign associates has been suspended since 1941 during the present emergency, and "until the present emergency terminates".

91. The filing of DP's foreign applications in the territory of NL's foreign associates is under the complete control of NL's foreign associates and all expenses incurred in filing and maintaining said patents are borne by NL's foreign associates who may abandon said patents or applications licensed to them by DP at will upon notifying DP of its intention to so abandon in which event DP may

elect to maintain the patent on its own account. There is no evidence that DP would have maintained the patent applications and patents abroad if NL's foreign associates had not carried the costs. DP patents issued in the name of DP in the territory of NL's foreign associates were sublicensed only if the sublicensees agreed not to export from the territory of the foreign associate.

92. No royalties were ever paid by DP to NL or by NL to DP (under the agreement made between NL and its foreign associates in 1937), and neither DP nor NL's foreign associates ever paid any royalties to each other for the use of the patents licensed by them in Exhibits M, N, Q, R, S.

93. The DP-Tinc licensing agreements of 1940 and 1941 did restrict and were intended to restrict the use and export of titanium pigments manufactured under any of said patents by purchasers of said pigments.

94. It is not claimed nor is there evidence that the defendants have controlled the supply of or restrained trade in ilmenite ore used in the commercial manufacture of titanium pigments in the United States.

95. The agreements and understandings entered into between the defendants and the other corporations herein named in Finding 1 have had the following necessary effects:

1. The defendant NL has refrained from competing with the other titanium pigment producers of the world outside of the Western Hemisphere and has not exported any titanium pigments or compounds outside

the Western Hemisphere unless requested so to do by its foreign associates.

2. DP has refrained from exporting titanium pigments or compounds outside the Western Hemisphere and has refrained from competing outside the Western Hemisphere with any of the co-conspirators in their respective exclusive territories.

3. All of the companies engaged in the manufacture of titanium pigments and compounds outside of the United States have refrained from importing such pigments or compounds into the United States and have refrained from competing with the defendants NL and DP in the United States.

4. The defendants NL, DP, and Tinc, have imposed restrictions on resales by purchasers of titanium pigments; but except to the extent found in Finding 93, the evidence does not establish as to DP that such restrictions were the result or effect of its agreements with NL or Tinc.

5. Prices of titanium pigments and compounds in the United States have been maintained at uniform levels and all competition with foreign producers in the manufacture and sale of titanium pigments and compounds in the United States has been eliminated.

6. The defendant DP has restricted the production of titanium pigments by its licensees Zirconium and VC to limit the competition of said licensees. Defendant NL has restricted the market of its licensee Zirconium.

7. The defendants NL and DP control and dominate the manufacture and sale of titanium pigments

and compounds in the United States to the exclusion of all actual or potential competition from any other potential entrant into the titanium pigment business in the United States.

8. The defendants NL and DP secured a monopoly on technical information relating to the manufacture and use of titanium pigments and certain apparatus and equipment necessary to the manufacture of certain titanium pigments to the exclusion and detriment of other producers now engaged in the titanium pigment business in the United States; when NL and DP ceased exchanging technical information, the titanium pigment business was a mature industry.

9. The defendants NL, DP and Tinc have utilized their patents which relate to the manufacture and use of titanium pigments to control and regulate the manufacture and sale of titanium pigments and compounds in the United States; and NL and Tinc with the cooperation of DP have done so throughout the rest of the world.

10. The defendants NL and Tinc, in cooperation with the European producers, have controlled the production of titanium pigments and compounds throughout the rest of the world outside of the United States and refrained from competing with their associated companies in markets allocated to said companies after the outbreak of hostilities in Europe in 1939, serving said allocated markets only at the request of their foreign associates and holding any profits therefrom in the markets so served for the associate to which said exclusive territory was allocated.

11. All of the patents and patent applications of NL's foreign associates in the United States which relate to the manufacture and use of titanium pigments have been and are available to DP on a royalty-free basis and similarly all of DP's patents and applications which relate to the manufacture and use of titanium pigments are available to NL's foreign associates in their respective exclusive territories throughout the rest of the world.

96. The intended effects of the acts of the defendants and the other members of the combination will probably continue to the extent that the post war conditions make possible.

CONCLUSIONS OF LAW

1. Beginning on or about July 30, 1920, NL and co-conspirator TAS and on various dates thereafter Tinc, DP and the others found herein to be co-conspirators continuing at all times thereafter to the date of these findings have been continuously engaged in a combination and conspiracy in restraint of trade and commerce in titanium pigments and compounds among the several states of the United States and with foreign nations and have been and are now parties to contracts, agreements and understandings in restraint of such trade and commerce.

2. Plaintiff is entitled to a decree.

SIMON H. RIFKIND,
U. S. District Judge.

IN THE

District Court of the United States

FOR THE SOUTHERN DISTRICT OF NEW YORK

UNITED STATES OF AMERICA, *Plaintiff,* *against* NATIONAL LEAD COMPANY, TITAN COMPANY, INC., E. I. DU PONT DE NEMOURS AND COMPANY, *Defendants.*	Civil No. 26-258

FINAL DECREE

This cause came on to be heard upon the complaint and the answers thereto upon the evidence and upon argument of counsel. The Court having thereafter rendered and filed its opinion and having made and entered findings of fact and conclusions of law wherein the defendants have been found to have been engaged in a combination in restraint of trade and commerce in titanium pigments among the several states of the United States and of foreign nations, and that the defendants have been and now are parties to contracts, agreements, and understandings in restraint of such trade and commerce in violation of Section 1 of the Sherman Act (26 Stat. 209, 15 U. S. C. § 1);

Now, therefore, upon motion of plaintiff by Wendell Berge, Assistant Attorney General, Herbert Berman and William C. Dixon, Special Assistants to the Attorney General, Julian Caplan and Ephraim Jacobs, Special Attorneys,

and John F. X. McGohey, United States Attorney, for relief in accordance with the prayer of the complaint, and the defendants having severally appeared by counsel, it is ORDERED, ADJUDGED and DECREED as follows:

1. The term "titanium pigments" as used herein shall mean any product containing two percent (2%) or more of the element titanium in a chemically, mechanically or physically combined state and mixtures thereof which can be used as pigments, whether or not adapted for other uses, and also extenders to be used in conjunction with any such product.

2. The term "defendants" shall mean the corporations hereinafter listed who may be identified by the designated abbreviations:

NL	National Lead Company
Tinc	Titan Company, Inc.
DP	E. I. du Pont de Nemours and Company

3. The term "co-conspirators" shall mean the corporations hereinafter listed, who may be identified by the designated abbreviations:

TP	The Titanium Pigment Company, Inc.
Krebs	Krebs Pigment & Color Corporation
TAS	Titan Co. A/S
IG	Interessengemeinschaft Farbenindustrie Aktiengesellschaft
TG	Titangesellschaft m.b.H.
SIT	Société Industrielle du Titane
ICI	Imperial Chemical Industries, Ltd.
GW	Goodlass Wall and Lead Industries, Ltd.
ISC	Imperial Smelting Corporation, Ltd.
BTP	British Titan Products Company, Ltd.

NTP or Laporte	National Titanium Pigments, Ltd.
CIL	Canadian Industries, Ltd.
CTP	Canadian Titanium Pigments, Ltd.
Kokusan or KK	Kokusan Kogyo Kabushiki Kaisha
TK	Titan Kogyo Kabushiki Kaisha
Terres Rares	Société des Produits Chimiques des Terres Rares
Thann	Fabriques des Produits Chimiques de Thann et de Mulhouse
Montecatini	Societa Anonima Titanium
Aussig	Verein fur Chemische und Metallurgische Produktion.

4. The term "patents as herein defined" shall mean United States letters patent and applications as follows: (a) the letters patent and patent applications listed in Appendix A hereof; (b) all divisions, continuations or reissues of any of the foregoing patents and applications; (c) all patents issued upon such applications; (d) all patents which cover any titanium pigments or any process for the manufacture of titanium pigments issued to any of the defendants within five years from the date of this decree; and all such patents which any of the defendants acquires within such five years; and all such patents of which any of the defendants becomes the exclusive licensee within such five years with power to sublicense.

5. The following agreements are hereby adjudged to be unlawful under Section 1 of the Sherman Act and each of them is hereby cancelled and the defendants and each of them and all persons acting or claiming to act through, for or under them and all successors and subsidiaries of any

of the defendants are hereby enjoined and restrained from the further performance of any of the provisions of said agreements and of any agreements amendatory thereof or supplemental thereto:

Agreement dated July 30, 1920, between TP and TAS (Exhibit A);

Agreement between TP and Krebs dated January 1, 1933, as amended January 1, 1941 (Exhibits E and E-3);

Agreements dated July 30, 1920, between NL, TP, The Titanium Alloy Manufacturing Company and TAS (Exhibits A-1 and A-2);

Agreement between TAS and SIT dated March 3, 1927 (Exhibit B);

Agreement between TAS and IG dated October 3 and 20, 1927 (Exhibit C);

Agreement between TAS and IG signed June 24 and October 20, 1927 (Exhibit C-1);

Agreement between TAS and TG signed October 3 and 20, 1927 (Exhibit C-3);

Agreement between TG and TAS dated October 3 and 20, 1927 (Exhibit C-7);

Agreement between TG and TAS dated October 3 and 20, 1927 (Exhibit C-8);

Agreement dated February 16, 1933 between ICI, ISC, GW and TINC (Exhibit F);

Agreements between TINC, SIT, TERRES RARES, and Thann dated June 5 and 17, 1935 (Exhibits G-1 and G-2);

Agreements between TINC, TERRES RARES, and IG, and between TINC, Terres Rares, IG, TG, Thann, and Doitsu both dated January 18, 1936 (Exhibits J and J-2);

Agreement between NL and CIL dated January 1, 1937 (Exhibit K);

Agreement between NL and CTP dated January 1, 1937, as amended February 27, 1939 (Exhibits K-1 and K-5);

Agreements between DP and TINC dated July 27, 1937, June 20, 1938, April 21, 1939, May 10, 1940, and June 23, 1941 (Exhibits M, N, Q, R and S), and the

"License Field Extender" agreements to which NL or TINC were parties, including the agreement between NL and TINC dated March 28, 1939 (Exhibit O);

provided, however, that the provisions of this paragraph with respect to the agreements between TP and Krebs dated January 1, 1933, as amended January 1, 1941 (Exhibits E and E-3) shall not go into effect until the expiration of nine months from the date of this decree.

6. Each of the defendants and each of their directors, officers, agents, employees, successors and subsidiaries and all persons acting, or claiming to act under, through or for them or any of them are hereby enjoined and restrained (a) from entering into, adhering to, maintaining or furthering, directly or indirectly, or claiming any rights under any contract, agreement, understanding, plan or program among themselves, the co-conspirators, or with any other person, partnership or corporation, which has as its pur-

pose or effect the continuing or renewing of any of the agreements listed in paragraph 5 hereof; (b) from entering into, adhering to, maintaining or furthering, directly or indirectly, any contract, agreement, undertaking, plan or program with any other producer or dealer relating to titanium pigments which has as its purpose or effect (1) to divide sales or manufacturing territories, (2) to allocate markets, (3) to limit or prevent United States imports or exports, (4) to grant to any third party any market as its exclusive territory, (5) to keep any third party out of any market; provided, however, that nothing contained in this subdivision (b) of this paragraph 6 shall prohibit any normal and usual arrangements between any defendant and its directors, officers, employees, agents, subsidiaries, or any dealer or distributor, whether or not a co-conspirator; (c) from restricting any purchaser of titanium pigments in the use thereof.

7. Each of the defendants is ordered to grant to any applicant therefor, including any defendant or co-conspirator, a non-exclusive license under any or all of the patents as herein defined at a uniform, reasonable royalty. Such grant may, at the option of the licensor, be conditioned upon the reciprocal grant of a license by the applicant, at a reasonable royalty, under any and all patents covering titanium pigments or their manufacture, now issued or pending, or issued within five years from the date of this decree, if any, owned or controlled by such applicant. Such license or reciprocal license may, at the option of either party, contain a provision for the inspection of the books and records of the licensee by an independent auditor who shall report to the licensor only the amount of royalty due and

payable and no other information. During a period of three years from the date of this decree such license or reciprocal license may at the option of either party contain a provision for the imparting in writing at a reasonable charge, by the licensor to the licensee, of the methods and processes used by the former at the date of the license in its commercial practice under the licensed patents in connection with the production of titanium pigments. The Court reserves jurisdiction to pass upon the reasonableness of any royalty or charge herein directed to be reasonable. Defendants are restrained from attempting to enforce any rights under any foreign patents owned by them or under which they are the exclusive licensees to prevent the exportation of titanium pigments from the United States to any foreign country.

8. Within one year from the date of this decree, defendants NL and Tinc shall present to the Court for its approval a plan for divesting themselves of their stock holdings and other financial interests, direct and indirect, in BTP, CTP, TG and TK, or for the purchase of the entire stock holdings and other financial interests, direct and indirect, in said companies or any of them. Such plan of sale shall not provide for the transfer of such stock or interest to any other defendant or to any corporation in which any defendant will, upon consummation of the plan, have any interest, provided that this provision shall not preclude transfer of said defendants' stock holdings in BTP to ISC, GW, and ICI, or any of them, or preclude transfer of said defendants' stock holdings in CTP to CIL. The plan shall provide for its completion within two years from the date of this decree.

9. Either American Zirconium Corporation or Virginia Chemical Corporation, their successors or assigns, may at

their option, if exercised within six months from the date of this decree, apply for licenses from DP under the provisions of paragraph 7. In the event American Zirconium Corporation, Virginia Chemical Corporation or their respective successors or assigns exercise the foregoing option, DP is enjoined from collecting royalties under any existing license agreement relating to titanium pigments between it and the person exercising the option in respect of any period subsequent to such exercise. Defendants NL, Tinc and DP are hereby enjoined from bringing, or threatening to bring, any action against any person or corporation for the alleged infringement prior to the date of this decree of any patent as herein defined.

10. The Attorney General of the United States or his proper representative shall, for the purpose of securing compliance with this decree, be permitted (1) access, during the office hours of the defendants, to all books, ledgers, accounts, correspondence, memoranda, and other records and documents in the possession or under the control of the defendants, relating to any matters contained in this decree, (2) subject to any legally recognized privilege, without restraint or interference from the defendants, to interview officers or employees of the defendants, who may have counsel present, regarding any such matters; provided, however, that information obtained by the means permitted in this paragraph shall not be divulged by any representative of the Department of Justice to any person other than a duly authorized representative of the Department of Justice except in the course of legal proceedings for the purpose of securing compliance with this decree in which the United States is a party or as otherwise required by law.

11. Judgment is entered against the defendants for all costs to be taxed in this proceeding.

12. The cancellations, injunctions and all executory action provided for under this decree shall not become effective or operative until ninety days from the date of this decree.

13. Jurisdiction of this cause, and of the parties hereto, is retained by the Court for the purpose of enabling any of the parties to this decree, or any other person or corporation that may hereafter become bound, in whole or in part, thereby to apply to the Court at any time for such further orders, modifications, vacations or directions as may be necessary or appropriate

(1) for the construction or carrying out of this decree, and

(2) for the enforcement of compliance therewith and the punishment of violations thereof.

Dated at New York,
October 11, 1945.

SIMON H. RIFKIND,
District Judge.

DISTRICT COURT OF THE UNITED STATE, FOR THE SOUHTERN DISTRICT OF NEW YORK

Civil No. 26-258

UNITED STATES OF AMERICA,

Plaintiff,

against

NATIONAL LEAD COMPANY, TITAN COMPANY, INC., E. I. DU PONT DE NEMOURS AND COMPANY, INC.,

Defendants

STATEMENT AS TO JURISDICTION

In compliance with Rule 12 of the Rules of the Supreme Court of the United States, as amended, the defendants National Lead Company and Titan Company, Inc. submit herewith their statement particularly disclosing the basis upon which the Supreme Court has jurisdiction on appeal to review the judgment of the District Court entered in this cause on October 11, 1945. A petition for appeal was filed on December 10, 1945, and is presented to the District Court herewith.

Jurisdiction

The jurisdiction of the Supreme Court to review by direct appeal the judgment entered in this cause is con-

ferred by Section 2 of the Expediting Act of February 11, 1903, as amended (32 Stat. 823; 36 Stat. 1167; 15 U. S. C. 29), and Section 238 of the Judicial Code, as amended (36 Stat. 1157; 38 Stat. 804; 43 Stat. 938; 28 U. S. C. 345).

The following decisions sustain the jurisdiction of the Supreme Court to review the judgment in this cause on direct appeal: *Hartford Empire Company et al.* v. *United States*, 323 U. S. 386 (1945); *United States* v. *Crescent Amusement Company et al.*, 323 U. S. 173 (1944); *United States* v. *Bausch & Lomb Optical Company et al.*, 321 U. S. 707 (1944); *United States* v. *Univis Lens Company, Inc. et al.*, 316 U. S. 241 (1942); *Ethyl Gasoline Corporation et al.* v. *United States*, 309 U. S. 436 (1940).

Statutes Involved

The Sherman Act of July 2, 1890, 26 Stat. 209, as amended (15 U. S. C. 1 and 2) provides:

> "§ 1. Trusts, etc., in restraint of trade illegal; exception of resale price agreements; penalty
>
> "Every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations, is hereby declared to be illegal: *Provided*, That nothing contained in sections 1-7 of this title shall render illegal, contracts or agreements prescribing minimum prices for the resale of a commodity which bears, or the label or container of which bears, the trade mark, brand, or name of the producer or distributor of such commodity and which is in free and open competition with commodities of the same general class produced or distributed by others, when contracts or agreements of that description are lawful as applied to intrastate transactions, under any statute, law, or public policy now or hereafter in effect in any State, Territory, or the District of Columbia in which

such resale is to be made, or to which the commodity is to be transported for such resale, and the making of such contracts or agreements shall not be an unfair method of competition under section 45, as amended and supplemented, of this title: *Provided further*, That the preceding proviso shall not make lawful any contract or agreement, providing for the establishment or maintenance of minimum resale prices on any commodity herein involved, between manufacturers, or between producers, or between wholesalers, or between brokers, or between factors, or between retailers, or between persons, firms, or "corporations in competition with each other. Every person who shall make any contract or engage in any combination or conspiracy declared by sections 1-7 of this title to be illegal shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding $5,000, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court. July 2, 1890, c. 647, § 1, 26 Stat. 209; Aug. 17, 1937, c. 690, Title VIII, 50 Stat. 693.

"§ 2. Monopolizing trade a misdemeanor; penalty

"Every person who shall monopolize, or attempt to monopolize, or combine or conspire with any other person or persons, to monopolize any part of the trade or commerce among the several States, or with foreign nations, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding $5,000, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court. July 2, 1890, c. 647, § 2, 26 Stat. 209."

The Issues and the Ruling Below

On June 24, 1944, the United States filed its complaint charging National Lead Company, Titan Company, Inc. and E. I. du Pont de Nemours and Company with violations of Sections 1 and 2 of the Sherman Act and praying that

such violations be enjoined and for certain other relief.

The facts may be summarized as follows:

The defendants National Lead Company (hereinafter designated as NL) and E. I. du Pont de Nemours and Company, Inc. (hereinafter designated as DP) are manufacturers and producers of titanium pigments in the United States; and Titan Company, Inc. (hereinafter designated as Tinc), which is wholly owned by NL, is in turn the owner of usbstantial stock interests in certain foreign companies.

Titanium is an element contained in ilmenite and other minerals. In and before 1920 there was no substantial trade or commerce in, and no commercial manufacture of, titanium pigments for use in paint, paper, rubber or other products; pigments used for such purposes were lithopone, white lead and zinc oxide. In 1920 the Titanium Pigment Company (predecessor in interest of NL) and Titan A/S (a Norwegian company, predecessor in interest of Tinc) made an agreement whereby the American company was exclusively licensed under the Norwegian owned patents for North America, with the right to grant sublicenses, and the Norwegian company was similarly licensed under the American owned patents outside North America. The parties agreed to make available to each other copies of patent applications and the validity of patents was not to be questioned. Each party appointed the other as its sole agent for the other's territory within the licensed field (which was defined in the agreement) and each party agreed to impart to the other full technological information relating to the licensed field. Licensees and sublicensees were required to agree to the terms of this 1920 agreement. On the basis of this agreement, and utilizing the Norwegian as well as its own United States patents, Titanium Pigment (then and thereafter financed and in 1936 fully acquired

by NL) undertook a program for the development and promotion of titanium pigments as an economical and otherwise desirable substitute for the pigments then on the market.

By 1933 DP had obtained rights under the Blumenfeld patents (hereinafter more fully described) which disclosed processes having certain substantial advantages in respect of manufacture of pure titanium dioxide. After a period of negotiation, and in view of genuine fear of prolonged, costly, and wasteful patent controversy, DP and NL exchanged licenses.

American Zirconium Company entered the field in 1935 with a license from both DP and NL. In 1937 Virginia Chemical Company entered the business with a license from DP but not from NL.

Meanwhile the Norwegian company attempted to exploit its position in Europe. Little was accomplished, however, until 1927 when National Lead purchased 87% of Titan A/S which at that time was heavily indebted to certain Norwegian banks. Shortly before this purchase I. G. Farbenindustrie, a German company, was endeavoring to purchase the Norwegian company. After NL's purchase an agreement was made between the Norwegian company and I. G. Farbenindustrie to form a new German company, Titangesellschaft, which was to have the exclusive license of the parties' patents for Germany and certain other territory. A similar procedure was followed later in forming a British company and, with certain modifications, a Canadian company. A Japanese company was formed under different circumstances but incorporating the same general principles.

As each new company was formed contracts were entered into similar in most respects to the original contract between Titanium Pigment Company and Titan A/S.

Meanwhile Joseph Blumenfeld, a chemist and managing director of Societe du Produits de Chemiques des Terres Rares, a French company in which he owned stock, had obtained certain patents relating to the manufacture of titanium compounds which he had assigned to Terres Rares. Between 1922 and 1933 Terres Rares granted exclusive licenses to a French Company for France, an Italian company for Italy, a Czechslovakian company for Czechslovakia and Central Europe, and to Laporte for the British Empire. Terres Rares sold its United States titanium patents to Commercial Pigments Company (predecessor in interest of DP).

Agreements were made between the Blumenfeld licensees and the TINC companies in Europe of a strictly commercial nature, dealing with prices, production, etc. There was no patent or technological exchange.

The Government contended—

a) that all the contracts to which National Lead Company or Titan Company, Inc. were parties were unlawful and that their performance should be enjoined;

b) that the defendants had combined and conspired to restrain foreign and domestic trade and commerce with the United States in titanium compounds in violation of Section 1 of the Sherman Act;

c) that the defendants had combined and conspired to monopolize trade and commerce in titanium compounds among the several states of the United States and with foreign nations in violation of Section 2 of the Sherman Act;

d) that the Court should perpetually enjoin the defendants and their representatives from combining and

conspiring or agreeing to restrain and monopolize trade and commerce among the several states of the United States or with foreign nations with respect to titanium compounds and that they be perpetually enjoined from engaging in or participating in practices, contracts, relationships, or understandings having the purpose or effect of continuing, reviving, or renewing any violation of the Sherman Act;

e) that the Court should order the defendants to grant upon request of any third person a royalty free license to make, use or sell any invention or inventions which defendants have used in carrying out the alleged illegal agreements and to furnish such third person all technical information appropriate to practice said invention.

On July 5, 1945, after a full hearing, the District Court rendered its opinion, and, on October 2, 1945, it entered its findings of fact and conclusions of law. It held that the defendants had violated Section 1 of the Sherman Act and that the Government was entitled to a decree which would restore titanium to the system of free competition and destroy the means of preventing such competition.

Accordingly, the District Court by its final decree—

1. Adjudged the agreements to be unlawful under Section 1 of the Sherman Act, canceled said agreements and enjoined the defendants and any person acting or claiming to act through or for them from the further performance of any of the provisions of said agreements.

2. Enjoined the defendants from (a) entering into, adhering to, or claiming any rights under any contract, agreement, undertaking, plan or program among themselves, the co-conspirators or with any other person, partnership or

corporation which has as its purpose a renewing of any of said agreements; (b) from entering into, adhering to, maintaining or furthering, directly or indirectly, any contract, agreement, undertaking, plan or program with any other producer or dealer relating to titanium pigments which has as its purpose or effect (i) to divide sales or manufacturing performance, (ii) to allocate markets, (iii) to limit or prevent United States imports or exports; (iv) to grant any third party any market as its exclusive territory; (v) to keep any third party out of any market; (c) from restricting any purchaser of titanium pigments in the use thereof.

3. Ordered the defendants to grant to any applicant a non-exclusive license on a uniform reasonable royalty basis under any existing United States patent and patent application owned by them and under all United States patents issued to them within a period of five years from the date of the Final Decree and also for a period of five years under any patent under which they became exclusive licensees with the right to grant sublicenses.

4. Ordered the defendants at their option or at the option of the licensee to impart in writing, at a reasonable charge, the methods and processes used by the licensor at the date of the license in its commercial practice and under the license patents in connection with the production of titanium pigments.

5. Ordered the defendants National Lead Company and Titan Company, Inc. to present within one year from the date of the Final Decree to the court for its approval a plan for divesting themselves of their stock holdings and financial interests, direct or indirect, in certain foreign companies, or of the purchase of the entire stock holdings of

other financial interests in said company. The plan is to provide for its completion within two years from the date of the Final Decree.

6. Enjoined the defendants from bringing or threatening to bring any action against any person or corporation for the infringement prior to the date of the Final Decree of any patent as defined in the Final Decree.

The Questions Are Substantial

We believe that the District Court erred in holding that the agreements were illegal under Section 1 of the Sherman Act. Exclusive, restricted licenses have been upheld by this Court in *Bement* v. *National Harrow Company*, 186 U. S. 70, 94. Cross-license agreements defining a "licensed field", containing provisions for the license of future patents, and fixing the terms under which licenses and sub-licenses were to be granted have been approved in *Standard Oil Company (Indiana) et al.* v. *United States*, 33 F. (2d) 617, 626 (N. D. Ill.), rev'd 283 U. S. 163. Exclusive agency: *Schnerb et al.* v. *Caterpillar Tractor Co.*, 43 F. (2d) 920, 921 (C. C. A. 2d), cert. denied 282 U. S. 898; *Baran* v. *Goodyear Tire & Rubber Co. et al.*, 256 Fed. 571, 572 (S. D. N. Y.). Exchange of information: *Maple Flooring Manufacturers Assn. et al.* v. *United States*, 268 U. S. 563. Allocation of territory: *Phillips* v. *Iola Portland Cement Co.*, 125 Fed. 593, 595 (C. C. A. 8th), cert. denied 192 U. S. 606; *Kentucky Natural Gas Corporation* v. *Indiana Gas & Chemical Corporation et al.*, 118 F. (2d) 831, 834 (C. C. A. 7th); *Thoms* v. *Sutherland et al.*, 52 F. (2d) 592, 596 (C. C. A. 3rd). The agreements were a reasonable exercise of patent rights and therefore do not violate the Sherman Act even though they contain provisions for the exchange of technical information (*Appalachian Coals, Inc.* v. *United States*, 288 U. S. 344,

374; *Bee Mach. Company, Inc.* v. *Freeman*, 131 F. (2d) 190 (C. C. A. 1), aff'd 319 U. S. 448, rehearing denied 320 U. S. 809); territorial restrictions (*Becton, Dickinson & Company* v. *Eisele & Company*, 86 F. (2d) 267 (C. C. A. 6), cert. den. 300 U. S. 667), and provisions for exclusive sales agencies (*Virtue* v. *Creamery Package, etc.*, 227 U. S. 8, 32). The purpose and effect of the agreements were "to promote the progress of science and useful arts" and to stimulate commercial development of the inventions licensed. Const., Art. I, sec. 8; see also *Motion Picture Patents Company* v. *Universal Film, etc.*, 243 U. S. 502, 511.

The Court was without jurisdiction to consider the conduct abroad of foreign corporations relating to commerce of foreign nations, and therefore could not invalidate certain of the contracts which have been canceled and declared illegal, even though an American company was a party to said contracts. *American Banana Company* v. *United Fruit Company*, 213 U. S. 347. The facts and issues in this case can be clearly distinguished from those in *United States* v. *Sisal Sales Corporation*, 274 U. S. 268. The issues have become moot by the intervention of war in Germany, Japan and Italy, at least to the extent that agreements with nationals of these countries are concerned, and the complaint should have been dismissed as to those contracts. *United States* v. *Hamburg-Amerikanische Packetfahrt A. G.*, 239 U. S. 466 (1916). As to the British and Canadian agreements the issues have become moot because new agreements were presented to the Court omitting any territorial restrictions or exclusive licenses. *Standard Oil Company* v. *United States*, 283 U. S. 163; *United States* v. *United States Steel Corporation*, 251 U. S. 417.

In any event the issues in this case are of substance and call for review by the Supreme Court.

A copy of the opinion in the District Court dated October 11, 1945, is appended hereto.*

Dated, December 10, 1945.

In the Supreme Court of the United States

OCTOBER TERM, 1946

No. 89

THE UNITED STATES OF AMERICA, APPELLANT

v.

NATIONAL LEAD COMPANY, TITAN COMPANY, INC., AND E. I. DU PONT DE NEMOURS AND COMPANY, INC.

MOTION BY THE UNITED STATES FOR LEAVE TO AMEND ITS ASSIGNMENT OF ERRORS

The United States moves the Court for leave to amend its first assignment of error so that it should read as follows:

> The court erred in failing to enter an injunction perpetually enjoining the defendants from enforcing the titanium patents presently owned or controlled by them.

This is a civil proceeding brought by the United States under Section 4 of the Sherman Act, in which the district court adjudged that the defendants (present appellees) had violated Section 1 of the Act and entered judgment against them. In the district court the United States

720249—46

requested that the court enter a judgment requiring each appellee to make available to any applicant on a royalty-free basis, for the duration of the patents, any or all patents then owned or controlled by it relating to the manufacture or use of titanium pigments or compounds (R. 39–40, 180, 1220). The judgment which was entered did not grant this relief, but required each defendant to grant to any applicant a nonexclusive license under any or all of its existing patents or patent applications for titanium pigments or compounds, at a uniform, reasonable royalty (R. 313–314).

In the appeal taken by the United States it assigned as error, among other things (R. 330, 331):

> 1. The court erred in failing to require each defendant to license its existing titanium pigment patents free of royalty until the court shall have determined, on application by any defendant, that the effects of the defendants' illegal combination, as set forth in the court's findings of fact and conclusions of law, have been fully dissipated.
>
> * * * * *
>
> 7. The court erred in failing to grant to the plaintiff the relief to which it is entitled.

By letters dated October 17, 1946, the United States advised counsel for the respective appellees that it proposed to argue under its seventh assignment of error that the district court erred in

failing to hold that the defendants' existing titanium patents are perpetually unenforceable because of the use made of them in restraining trade beyond the scope of the patent grant and in failing to enter an injunction perpetually enjoining the enforcement of such patents. Counsel were requested to advise whether they would contend that this argument is not within the scope of the Government's assignment of errors. Counsel for appellees National Lead Company and Titan Company, Inc., responded that they would not so contend and counsel for appellee E. I. du Pont de Nemours and Company, Inc., declined to give such assurance. A copy of the Solicitor General's letter of October 17, 1946, and a copy of the two replies from counsel for appellees are attached hereto and marked, respectively, Exhibit A, Exhibit B, and Exhibit C. We are advised by the Clerk that the case will not be reached for oral argument until the week of February 3rd.

The proposed amendment of petitioners' assignment of error cannot prejudice appellee du Pont since it has been given adequate advance notice of the question which the United States proposes to present to the Court and since substantially the entire record in the case is before the Court on the appeal and the omitted portions of the record are not in any respect relevant to this question. The amended assignment is within the

scope of the relief sought in the district court. (R. 39–40, 180, 1220).

In these circumstances, it would seem to be in the interest of justice that there be appellate review of the respects in which the Government deems that the relief granted by the district court was inadequate. It would also seem desirable to remove from the field of controversy dispute as to what is or is not within the scope of the Government's original assignment of errors.

This Court has previously granted motions to amend assignments of errors. *Dayton Power and Light Co.* v. *Public Utilities Commission of Ohio*, 292 U. S. 290, 312; *O'Connell* v. *United States*, 253 U. S. 142, 144, 147.

It is submitted that, for the reasons stated, the Court should grant the Government's motion.

Respectfully submitted.

GEORGE T. WASHINGTON,
Acting Solicitor General.

BETHUEL M. WEBSTER, Esq.,
Webster & Garside,
15 Broad Street, New York 5, N. Y.

DEAR MR. WEBSTER: We propose to argue under our seventh assignment of error that the district court erred in failing to hold that the defendants' existing titanium patents are perpetually unenforceable because of the use made of them in restraining trade beyond the scope of the patent grant, and in failing to enter an injunction perpetually enjoining the enforcement of such patents.

We assume that you will not take the position that this argument is not within the scope of the errors which we have assigned. If you intend to make this point would you be good enough to advise us promptly of that fact.

Sincerely yours,

J. HOWARD MCGRATH,
Solicitor General.

OCTOBER TERM, 1946

No. 89

THE UNITED STATES OF AMERICA, APPELLANT

v.

NATIONAL LEAD COMPANY, TITAN COMPANY, INC., AND E. I. DU PONT DE NEMOURS AND COMPANY, INC.

ON APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE SOUTHERN DISTRICT OF NEW YORK

BRIEF FOR THE UNITED STATES

OPINION BELOW

The opinion of the district court (R. 185) is reported in 63 F. Supp. 513.

STATUTE INVOLVED

The Act of July 2, 1890, 26 Stat. 209, known as the Sherman Act, provides in part as follows:

> SECTION 1 [as amended by the Act of August 17, 1937, 50 Stat. 693]. Every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations, is here-

by declared to be illegal: * * * (15 U. S. C. sec. 1.)

SEC. 2. Every person who shall monopolize, or attempt to monopolize, or combine or conspire with any other person or persons, to monopolize any part of the trade or commerce among the several States, or with foreign nations, shall be deemed guilty of a misdemeanor, * * * (15 U. S. C, sec. 2)

* * * * *

SEC. 4 [as amended by the Act of March 3, 1911, Sec. 291, 36 Stat. 1167]. The several district courts of the United States are hereby invested with jurisdiction to prevent and restrain violations of this act; and it shall be the duty of the several district attorneys of the United States, in their respective districts, under the direction of the Attorney-General, to institute proceedings in equity to prevent and restrain such violations. * * * (15 U. S. C. sec 4.)

JURISDICTION

The judgment of the district court was entered on October 11, 1945 (R. 307). The Government's petition for appeal and the separate cross appeals of the defendants were all filed and allowed on April 18, 1946 (R. 329, 334, 335, 350).

The jurisdiction of this Court is conferred by Section 2 of the Act of February 11, 1903, 32 Stat. 823, 15 U. S. C. sec. 29, and Section 238 of the Judicial Code, as amended by the Act of

February 13, 1925, 43 Stat. 936, 938, 28 U. S. C. sec. 345. Probable jurisdiction was noted on May 20, 1946 (R. 1289).

QUESTIONS PRESENTED

1. Where a court finds, in a suit under Section 4 of the Sherman Act, that a combination has created and maintained a patent position in violation of the antitrust laws and has illegally extended privileges granted by the patent laws, should the judgment enjoin future enforcement of the misused patent privileges?

2. Whether the judgment below granted adequate relief against the foregoing abuses in permitting the defendants to charge "reasonable royalties" in connection with the requirement for licensing the abused patents to any applicant.

3. Whether the judgment below granted adequate relief by permitting defendants to condition such licensing upon the grant of reciprocal licenses by the applicant under all patents owned by such applicant during the period of five years after the entry of the judgment.

4. Whether a combination which has illegally acquired a monopoly of technological information relating to methods and processes for manufacturing titanium pigments should be required to furnish such information at a reasonable charge to any applicant.

5. Whether two producers of over 90% of the pure titanium dioxide and 100% of titanium com-

posite pigments who by illegal combination have acquired domination and control over the titanium industry, should be required to divest themselves of part of their plant capacity.

TABLE OF ABBREVIATIONS

1. The following abbreviations will be used to identify the defendants and co-conspirators:

NL	National Lead
Tinc	Titan Company, Inc.
DP	E. I. du Pont de Nemours and Company, Inc.
TP	The Titanium Pigment Company, Inc.
Krebs	Krebs Pigment & Color Corporation
TAS	Titan Co. A/S
IG	Interessengemeinschaft Farbenindustrie Aktiengesellschaft
TG	Titangesellschaft, g. m. b. h.
SIT	Societe Industrielle du Titane
ICI	Imperial Chemical Industries, Ltd.
GW	Goodlass Wall and Lead Industries, Ltd.
ISC	Imperial Smelting Corporation
BTP	British Titan Products, Ltd.
NTP or Laporte	National Titanium Pigments, Ltd.
CIL	Canadian Industries, Ltd.
CTP	Canadian Titanium Pigments, Ltd.
Kokusan or KK	Kokusan Kogyo Kabushiki Kaisha
TK	Titan Kogyo Kabushiki Kaisha
Terres Rares	Societe de Produits Chemiques des Terres Rares
Thann	Fabrique de Produits Chemiques de Thann et de Mulhouse
Montecatini	Societa Anonima Titanium
Aussig	Verein für Chemische and Metallurgische Produktion

2. RE refers to Exhibit Volumes of Record.

STATEMENT

THE PROCEEDING

This is a civil action by the United States charging that defendants National Lead Company (NL), its wholly owned subsidiary Titan Com-

pany, Inc. (Tinc), and E. I. du Pont de Nemours and Company (DP), and certain non-defendant co-conspirators, were parties to a combination to restrain and monopolize interstate and foreign commerce in titanium pigments in violation of Sections 1 and 2 of the Sherman Act. The evidence introduced in support of the charges was mainly documentary. After hearing, the trial court rendered an opinion holding that the combination was in violation of Section 1 of the Sherman Act and stating that the United States was entitled to a decree "which will restore titanium to the system of free competition" (R. 222).[1]

The findings of fact (R. 234–306) state that defendants and their foreign co-conspirators were parties to an international agreement, necessarily affecting the interstate and foreign commerce of the United States in titanium pigments. Among these effects were that the defendants have refrained from exporting titanium pigments to certain foreign countries; that all foreign producers have refrained from exporting such pigments to the United States and from competing with the defendants in the United States; that the defendants have imposed restrictions on resales by purchasers of titanium pigments; that prices in the United

[1] The District Court did not deem it necessary to consider whether a violation of Section 2 had been proved (R. 203). That such a violation was proved seems clear. *American Tobacco Co.* v. *United States*, Nos. 18, 19, 20, 1945 Term, decided June 10, 1946.

States have been maintained at uniform levels; that defendants have restricted the production of their two domestic licensees to limit their competition; that defendants control and dominate the manufacture and sale of titanium pigments in the United States to the exclusion of all actual or potential competition from any other potential entrant into the business in the United States; that defendants have secured a monopoly on technical information relating to the manufacture and use of titanium pigments and certain apparatus and equipment necessary to the manufacture of certain titanium pigments to the exclusion and detriment of other producers now engaged in the titanium business in the United States; that defendants have utilized their patents relating to the manufacture and use of titanium pigments to control and regulate the manufacture and sale of such pigments in the United States; and that all of the patents of NL's foreign associates relating to the manufacture and use of titanium pigments have been and are available to DP on a royalty-free basis and similarly all of such patents of DP have been available to NL's foreign associates (R. 303–306). As will appear, another effect is that all of such patents of NL have been and are available to DP on a royalty-free basis and all of such patents of DP have been and are similarly available to NL.

The judgment of the trial court (R. 308–316) included provisions cancelling the agreements be-

tween the defendants and the agreements between NL and Tinc and their foreign co-conspirators found to be illegal (R. 310); and requiring NL and Tinc to submit a plan either for the divestment of their financial interests in the foreign co-conspirators or for the acquisition of the entire stock and other financial interest of the foreign co-conspirators (R. 314). The judgment further required the defendants to grant to any applicant, including any defendant or co-conspirator, a non-exclusive license at a uniform reasonable royalty under any or all patents now owned or acquired within five years relating to titanium pigments or the manufacture or use of such pigments. However, it permitted the defendants to condition the grant of such a license upon the reciprocal grant of a license by the applicant, at a reasonable royalty, under any or all patents owned or acquired within five years by such applicant. The judgment also provided that, for a period of three years, such license or reciprocal license may, at the option of either party, contain a provision for the imparting in writing at a reasonable charge by the licensor to the licensee of the methods and processes used by the former at the date of the license in its commercial practice under the licensed patents in connection with the production of titanium pigments. (R. 313–314.) The judgment also provided that the two present licensees of NL and DP might within

six months apply for licenses from NL and DP on the described basis (R. 314–315).

After the entry of the judgment, all the parties appealed to this Court. Upon the application of NL, this Court on January 2, 1946, suspended the operation of a portion of the judgment pending determination of the appeals.

The appeal by the Government (No. 89) attacks the provisions of the judgment relating to licensing of patents and imparting of technical information on the ground that the relief granted in those respects was insufficient. It also attacks the refusal of the trial court to grant a partial divestiture of the physical properties now owned and operated by NL and DP. (R. 330–331.)

The Facts[3]

Defendant NL has assets in excess of $100,000,000. It is the largest manufacturer of titanium pigments in the world. In 1943, the last year for which figures are found in the record, NL produced 76.5% of the composite and 46.4% of the pure titanium pigments produced in the United States. (R. 236.) NL owns all of the stock of defendant Tinc, a holding company (R. 236). NL owns directly or indirectly through Tinc 99% of the stock of Titan Co. A/S (TAS); 49% of the voting stock of Canadian Titanium Pigments,

[3] This statement is taken in the main from the findings of fact (R. 234–306), which are not challenged by the Government.

Limited (CTP); 44% of the voting stock of British Titan Products Company, Limited (BTP); 50% of the voting stock of Titangesellschaft, g. m. b. h. (TG); 57% of the voting stock of Societe Industrielle du Titane (SIT); and 18.5% of the voting stock of Titan Kogyo Kabushiki Kaisha (TK), all of which are engaged in the titanium pigment business in foreign countries (R. 236–237, 242, 243).

Defendant DP has assets in excess of $1,000,000,000. It is the second largest manufacturer of titanium pigments in the world. In 1943 DP produced 23.5% of the composite and 45.1% of the pure titanium pigments made in the United States. (R. 237.)

Titanium pigments are manufactured from titanium, the ninth most abundant element on the earth's surface. Titanium is contained in ilmenite, which is found in the United States, Norway, India, Brazil, and elsewhere throughout the world. Titanium pigments possess great opacity, hiding power and chemical inertness, and are used in the manufacture of paints, rubber, glass, paper, vitreous enamels, and many other products. They are sold in competition with and are largely displacing other pigments such as lithopone and white lead. (R. 245–246.)* A quantity of titanium dioxide (TiO_2) is approximately three times as

* In 1943, the sales of titanium pigments by NL alone exceeded the sales in the United States of lithopone, zinc oxide and white lead by all producers (R. 273).

effective as the same quantity of lithopone (Ex. 4).[3a] Titanium pigments composed of titanium dioxide in a relatively pure form are described as pure pigments; those composed of titanium dioxide intimately mixed with one or more other pigmentary materials, as compounds or composite pigments (R. 378, 392). Composite pigments are commercially the most important and these have been subject to a 30% *ad valorem* import tariff since 1922 (R. 251).

Prior to 1920 there was no substantial trade or commerce in titanium pigments (R. 246). In that year the total production in the United States was 100 tons (on the basis of pure titanium dioxide content) and this increased to approximately 110,000 tons in 1943, with a peak production of approximately 128,000 tons in 1941 (R. 247). The total production of titanium pigments outside of the United States has shown much less growth, the estimated foreign production of titanium pigment being approximately 1000 tons in 1920 and 23,000 in 1938 (R. 247).

While there was no substantial commerce in titanium pigments prior to 1920, experimental work in this field had been carried on by chemists located in the United States, Norway, and France (R. 246–247). The American chemists, Barton and Rossi, had taken out important

[3a] By stipulation between the parties Exhibit 4 was not reproduced but is a part of the record for all purposes (R. 360).

patents on processes and products largely for the manufacture of composite titanium pigments (R. 246). These patents had been transferred to Titanium Pigment Company, Inc. (TP), a corporation formed to engage in further research development and promotion in the pigment field (R. 246). During the same period Gustav Jebsen, a Norwegian chemist and businessman, perfected processes, patented in Norway, the United States, England, Germany, and in other countries, for producing relatively pure titanium dioxide pigment by direct application of sulphuric acid. While the Norwegian chemist was aware of the possibility of composite pigments, he had not perfected processes for the manufacture of such products. In 1920 the process and product patents of Jebsen and his associates were held by Titan Company A/S (TAS), a Norwegian company. (R. 246–247.) In or about 1922 Joseph Blumenfeld, a French chemist, obtained patents in the United States and foreign countries relating to the manufacture of titanium pigments. These were assigned to Societe de Produits Chemiques des Terres Rares (Terres Rares), a French corporation (R. 247, 243).

In 1920, NL, a manufacturer of pigments, purchased ten percent of the stock of TP with an option to purchase up to fifty percent (R. 246). Thereafter, in July 1920, TP, whose policies were then and thereafter controlled by NL, entered into an agreement with TAS (R. 239, 251). Its pre-

amble recited that each of the parties owned and would thereafter own certain patents and that each desired to obtain rights under these patents (RE. 1). The essential features of the agreement are:

(a) The "licensed field" was defined to include all substances containing above 2% of titanium (unless such substances contained by weight more than 5% of a metal other than titanium in its purely metallic state) and all apparatus, methods, and processes useful in obtaining or manufacturing such substances (except as stated). The intention was to cover processes, substances, and apparatus in the titanium and titanium compound field. (R. 251.)

(b) TAS agreed to grant to TP "upon the terms and conditions, including the covenants and agreements, hereinafter specified" and the latter agreed to accept "a license exclusive of all others including" TAS under all "existing or future" patents of the Norwegian company within the "Licensed Field"; but only in or for territories within North America (defined as including the continent of that name, Central America, and Panama); and TP agreed to grant to TAS upon the same conditions the correlative rights, but only outside North America, under the existing or future patents of TP. The parties agreed not to sell outside their respective territories, except that reciprocal non-exclusive rights of sale were reserved for South America. (R. 252, RE. 3–4.)

(c) Detailed provision was made for exchange of copies of applications for patents filed by the parties or their other licensees, and for the filing and payment of expenses incidental to the prosecution of such applications and maintenance of patents in territories outside the territory of each; and there was provision for assignment by each company to the other in case either party elected not to prosecute applications or maintain patents outside its territory (R. 252).

Neither party would ever question or contest the validity of any patent of the other under which it is licensed (within the licensed field) (R. 252).

(d) TAS made TP the exclusive agent of TAS for sales by TAS in North America, such sales to be at prices and on terms determined by the agent, and TP similarly made TAS its sole agent for sales by TP outside North America and South America. With a view to "the wildest possible development of titanium products in the 'Licensed Field,'" it was agreed that, notwithstanding the agencies provided for, importations of "finished articles"—that is, paint, paper, rubber, glass, etc.—containing titanium products of the principal, its licensees or sublicensees, would be permitted, provided such products did not constitute such an important part of such finished articles that sales within the agent's territory would substantially interfere with the agent's sales of its own titanium products (R. 252–253.)

(e) Each party would impart semi-annually to the other full and accurate information in detail as to knowledge obtained in and applicable to the "licensed field," and would permit the other to inspect and study operations at its plants (exclusive of research laboratories) (R. 253).

(f) The reciprocal grants of exclusive licenses extended to December 31, 1936, and thereafter for periods of ten years each, with provision for termination by notice to be given at least five years before the end of any such period; and it was agreed that upon such termination each would receive for itself and its licensees within its territory a non-exclusive license under inventions covered by existing patents or applications of the other, but that in other respects the obligations, liabilities, and benefits would cease. (Notice of termination was never given.) (R. 253.)

(g) In Article XIV of the 1920 agreement (mentioned by number because of its significance in connection with later agreements) it was provided that each company would have the right, so long as it held an exclusive license from the other under the 1920 agreement, to grant licenses under its own patents and sublicenses under the other's patents on condition, nevertheless, that every such licensee or sublicensee would (i) grant to the party to the 1920 agreement other than its licensor its patent rights in the "licensed field" identical in character, territorial scope, and dura-

tion to those given by its licensor to the other party to the 1920 agreement, (ii) would appoint such other party its sole agent as specified above in respect to its licensor, and (iii) would impart technical information to such other party in the same manner and to the same extent as its licensor. (R. 254).

Simultaneously with the execution of this contract, NL entered into a contract with TAS and TP in which NL agreed to respect its provisions and to assign promptly to TP all patents, inventions, and improvements relating to titanium pigments which it then used or might thereafter acquire or which should be at its disposal throughout the world (R. 254).

The purpose and effect of these agreements were threefold: First, to promote the more rapid development of the business of NL and TAS by securing to each the right to use the processes and products covered by the patents held by the other, together with future developments and technological improvements and "know-how"; second, to keep these patent rights and technological know-how as the exclusive possession of the parties and their sublicensees; and third, to prevent competition in the industry on a world-wide basis (R. 254–255, 922, 924, 927–929, 968–981, RE. 3–7, 10–11, 13, 15–17, 798–802, 1436–1441, 2953–2955). It is significant to note, as the trial court pointed out, that the suppres-

sion of competition was not limited to patented articles or to articles produced by patented process but extended to all products within the "licensed field" (R. 191). Furthermore, no pretense was made of limiting restraints on the parties or on licensees to identified inventions or for the term of any patent. The restraints were co-extensive with all the operations of the industry and were to be maintained by the patent position created by the combination irrespective of the actual scope of the patents included in the pool.

In 1927, NL acquired control of TAS by purchasing 87% of its stock, Jebsen retaining the other 13% (R. 255, 240). NL made this acquisition for the purpose of utilizing TAS and the 1920 contract further to control competition in all markets of the world including the United States. The plan for accomplishing this purpose was as follows: TAS was to form in each of the important industrial countries, in association with a local company which contemplated the manufacture or sale of titanium pigments or which could contribute to the commercial or technical development or which threatened to be a serious competitor of NL or TAS, a new company in which NL or TAS was to have a part interest. Each company so formed was to be given as its exclusive territory a portion of the territory assigned to TAS by the 1920 agreement and was to

refrain from competing with NL in its exclusive territory or in the exclusive territory of any other company associated with NL. All of the present and future patents belonging to NL or TAS or any of the companies associated with either in the formation of such new companies, as well as those of the new companies to be organized, were to be licensed exclusively to NL for North America and to the new companies to be organized for their respective territories and to TAS for the rest of the world. (R. 255–256, RE. 637, 646, 653, 660, 661, 607–610, 619–621.)

The purpose of NL further to control competition was accomplished by a series of agreements entered into pursuant to this plan (R. 255). The first of these agreements was entered into in 1927 by TAS and Societe Industrielle du Titane (SIT), a French corporation. By this agreement SIT was given as its exclusive territory France and its territories except those appurtenant to North and South America. TAS owned about 20% of SIT and NL acquired an additional 58%. (R. 256, 241.)

NL regarded IG Farbenindustrie Aktiengesellschaft (IG), one of the largest chemical companies in the world, which had tried to acquire TAS in 1927, as either a potentially invincible competitor or the most powerful ally (R. 257, 255, 240). NL, therefore, through TAS, made IG an ally. TAS agreed with IG to form Titan-

gesellschaft (TG) to which was granted as its exclusive territory Germany, Russia, Austria, Hungary, Czechoslovakia, Switzerland, Rumania, Serbia, Croatia, Slovenia, Bulgaria, Greece, Turkey, Japan, China, and Spain. IG agreed to engage in the titanium pigment business only through TG. IG further agreed to transfer exclusively to TG all its patents, methods and experience relating to the manufacture or use of titanium pigments within the "licensed field." TG and TAS agreed to engage in the business only in the territory assigned to them and to exchange know-how. TG and TAS agreed that each might grant sub-licenses under the licensed patents and to exchange know-how with such sub-licensees (R. 257–259). IG and TAS each acquired 50% of the stock of TG (RE. 51–52).

In 1933, NL and Tinc, the successor to TAS,[4] became apprehensive over the threatened competition of Imperial Chemical Industries, Limited (ICI), the largest manufacturer of chemicals in the British Empire, and Goodlass Wall and Lead Industries (GW), the largest producer of lead pigments in the British Empire (R. 259,

[4] NL organized Tinc in 1929. Tinc became NL's corporate pocket for its holdings in foreign titanium enterprises. Tinc assumed all of the obligations of TAS and succeeded to all the benefits running to TAS under the 1920 agreement and the French and German agreements of 1927. NL owned 87% of the stock of Tinc until 1944 when it acquired the remaining 13%. (R. 255, 236, 237.)

241). Therefore, NL and Tinc entered into negotiations with ICI, GW and Imperial Smelting Corporation (ISC), one of the largest producers of pigments in the British Empire, which resulted in the formation of British Titan Products Company, Limited (BTP) and the assignment to it as its exclusive territory of the British Empire exclusive of portions within or appurtenant to North and South America. Tinc agreed not to conduct any operations relating to the manufacture or sale of Titanium pigments within that territory, and ICI, GW, and ISC agreed to conduct all of their operations of that nature anywhere only through BTP which in turn agreed to confine its operations to the territory assigned to it. ICI, GW and ISC further agreed to grant BTP exclusive licenses under all of their patents within the "licensed field." Tinc and BTP agreed to exchange exclusive licenses under their existing and future patents for their respective territories with the right to grant sub-licenses on a reciprocal basis. Each agreed also to exchange know-how. Tinc acquired 49% of the stock of BTP and each of the three British companies acquired 17% (R. 259–262, RE. 725–827, 833, 861).

Prior to 1936 certain Japanese companies were planning to enter the industry. NL, Tinc, IG and TG believed that these companies would export which would lead to competition in all of the markets of the world including the United

States. Therefore, Tinc, IG, TG, and companies operating under the Blumenfeld patents (for reasons which will appear later) entered into an agreement with Kokusan Kogyo Kabushiki Kaisha (KK), the largest manufacturer of paints in Japan, to form a new company, Titan Kogyo Kabushiki Kaisha (TK) to which was allocated as its exclusive territory the Japanese Empire. The agreements with TK were substantially similar to the 1920 and subsequent agreements. Tinc acquired 35% of the new company with IG having an option to purchase one-half of Tinc's share. (R. 264–266, 978–979, RE. 1544–1547; 2313–2338, 2346–2351.)

Under the 1920 agreement, Canada had been allocated to NL as part of its exclusive territory (R. 266). Prior to 1934, National Titanium Pigments, Limited (Laporte), a licensee under the Blumenfeld patents, was interested in erecting a titanium pigment factory. In 1937 NL and Canadian Industries, Limited (CIL),[5] which is owned substantially by DP and ICI, formed a new company, Canadian Titanium Pigments, Limited (CTP), through which NL and CIL agreed to conduct their titanium business in

[5] DP owns 45% of stock of CIL (RE. 2441). ICI owns 45%. DP sold its titanium pigment products in Canada prior to the creation of CTP to CIL and since the creation of CTP entirely to CTP (R. 270). DP and ICI had an agreement which provided that CIL would be used as the proper vehicle for cooperation in Canada (RE. 958).

Canada.[6] NL granted CTP, for Canada, an exclusive license under its present and future patents. CTP granted NL, for the rest of the world, an exclusive license under its present and future patents, with the condition that NL grant DP a nonexclusive license under them for North and South America. NL and CTP agreed to respect each other's territory. CTP then acquired the Canadian titanium business of Laporte with Laporte covenanting not to engage in the business in Canada until 1952. NL acquired 49% of the voting stock of CTP upon its formation (R. 267–270).

The intended effect of all of these agreements has been (1) to prevent among the parties competition in the licensed fields within the exclusive territory assigned to each; (2) to create a world-

[6] CIL agreed with NL that both companies would engage in the titanium pigment business in Canada only through CTP, and CIL agreed with NL not to deal in or manufacture titanium pigment anywhere in the world except at the request of CTP (R. 267–268). Prior to the execution of this contract, NL agreed with CIL, BTP and Laporte to maintain prices on American titanium pigments sold by NL in Canada above the prices charged for titanium pigments manufactured by BTP or Laporte and sold by BTP and Laporte in the Canadian market. This facilitated a price agreement between BTP and Laporte for the British Empire market outside of Canada. (R. 269.) Although the district court refused to find it as a fact, the record shows that on January 4, 1935, NL advised BTP by cable that American titanium *producers* would maintain Canadian prices on the foregoing basis (RE. 2436). DP and NL were the only American producers of titanium pigments at that time.

wide patent pool of many of the patents of commercial value relating to the manufacture of titanium pigments within the licensed fields in which the patents are available only to the parties; (3) to create a world-wide pool of technical information available only to the parties, the information being of inestimable value in developing the business of the parties to the exclusion of potential newcomers in the industry (R. 272, 271); and (4) to prevent entirely any patent litigation among the parties. There has been no patent litigation in the titanium pigment field anywhere in the world. Access to patent rights and technology in the industry has been only on terms established by the combination.

It has already been stated that Blumenfeld, the French chemist, had assigned his titanium pigment patents to Terres Rares (R. 247). Between 1922 and 1933, the latter granted exclusive licenses for specified territories to Fabrique de Produits Chemiques de Thann et de Mulhouse (Thann), a French company, Societa 'Anomina Titanium (Montecatini), an Italian company; Verein fur Chemische und Metallurgische Produktion (Aussig), a Czechoslovakian company; Laporte, a British company. The Commercial Pigment Company (CP), an American company (R. 273, 239) purchased the Blumenfeld patents in the United States. The Blumenfeld group were the only other principal producers and sellers of titan-

ium pigments in the world (R. 248), and they were in competition with the NL group (NL, TAS, SIT, TG, BTP and Tinc) in Europe, the British Empire (R. 273) and the United States (R. 239). NL desired to eliminate this competition and facilitate exchange of patent rights and technical information between the two groups in all markets of the world (R. 277). Negotiations between the NL and Blumenfeld groups to accomplish this objective were begun in 1930 (R. 277, 278).

By March 1931, a tentative understanding had been arrived at between NL's foreign associates and the Blumenfeld interests relating to markets outside the United States, an understanding which embodied both commercial and technical cooperation. The parties believed, however, that no agreement eliminating competition between the two groups in markets outside the United States would be effective unless they were secure against competition from American producers. (R. 277.) Since NL was prevented from exporting by the various agreements discussed above, CP remained the only other United States producer which might upset the world-wide plan by exporting titanium pigments. Through an agreement (Ex. E. R. 69) between TP and CP's successor (Krebs Pigment and Color Corporation [Krebs] at that time owned 70% by DP), the provisions of which will be discussed later (*infra* pp. 26–29), and assurances from DP, NL's foreign associates and the Blumenfeld representatives received adequate

assurances that there would be no exports from the United States (R. 280–289), after which NL's foreign associates and the Blumenfeld Companies entered into specific written agreements which brought under control of the parties thereto any competition theretofore existing in titanium pigments in all markets outside the Western Hemisphere (R. 273–277).

The first of these agreements (all of which Jebsen, acting for Tinc, either made or approved (R. 273)) was the TG-Aussig agreement of November 1933 (R. 274), which established sales quotas for the two companies for a specified territory, regulated prices, provided for the exchange of certain patents royalty-free, and required that both parties refrain from giving any technical information or aid to potential competitors. Aussig agreed to purchase from TG at preferential prices any requirements of titanium pigments, above Aussig's then production capacity, which it might need to meet its quota. A second agreement, the Contrat a Quatre, was executed in 1935 (R. 274), but to take effect as of May 1934 between SIT and Tinc on one hand and Thann and Terres Rares on the other. Here, also, sales quotas for specified territories were established, prices were regulated, certain patents were exchanged royalty-free, and assistance was to be withheld from potential competitors. The Contrat de Livraisons (R. 275) was executed at the

same time by the same parties, and provided that each group would supply the other at fixed prices with any titanium pigments which it might have available after its own needs were satisfied. Titanium pigments so supplied could not be re-exported by the parties or their customers. The Contrat a Six (R. 275) was also entered into at this time by Thann, Terres Rares, Montecatini Tinc, SIT, and TG. The parties' exclusive rights of sale in specified territories were recognized; sales were allotted for these territories on a quota basis; third parties were to be prevented from entering the titanium pigment business within any of the territories; sales prices were to be fixed by mutual consent; certain patent rights were to be exchanged royalty-free.

The British Empire was not included within the above agreements. It will be recalled that Laporte was the Blumenfeld licensee for the British Empire (R. 273), and was obligated under its agreement with Blumenfeld to refrain from exporting outside this territory (R. 277). In 1934 BTP and Laporte entered into a price agreement for the British Empire, and in 1941 they executed a quota agreement, allocating to each a specified share of the titanium pigment business in the British Empire (R. 276). This

[7] Under the Contrat a Six, Terres Rares and Thann were recognized, together with TG, as having exclusive rights of sale in Japan. It was for this reason that the Blumenfeld companies were given a share in the Japanese company, TK, organized in 1936 (R. 265).

did not include Canada, since Laporte withdrew from the Canadian market in 1937 in favor of CTP (R. 269).

These agreements between the foreign associates of NL and Blumenfeld were intended to help NL and Tinc prevent any exports to the United States. This intention was achieved. There have been no exports to the United States by any of Blumenfeld's foreign associates (R. 277, 289, 790–793, 825, 979–980, RE. 706, 1068, 1224, 1264, 2045, 2061–2063, 2081, 2288–2292, 2915–2916).

The agreement with DP[8] and NL in 1933 (Ex. E) which removed the obstacles to the agreements between the foreign associates of NL and the Blumenfeld companies followed negotiations initiated in 1930 between NL and CP, then the only two producers of titanium pigments in the United States (R. 277, 278). In July 1931, the business of CP was acquired by Krebs, a corporation 70% of whose stock was owned by DP (R. 238).[9] Thereafter, negotiations were instituted between NL and Krebs which culminated in the agreement (Ex. E) between TP and Krebs in August 1933

[8] DP, one of the largest lithopone producers, was aware of the threat of titanium pigments to its lithopone business. It had, therefore, prior to 1930, attempted to make some arrangement with NL which would permit it to enter the industry.

[9] DP acquired the remaining 30% in 1934. In 1935 DP acquired all the assets and assumed all the obligations of Krebs and, thereafter, operated the properties through the Krebs Division of DP (R. 238).

(R. 280). Its preamble recited that each desired to obtain from the other "a license of the character and scope and upon and subject to the terms and conditions hereinafter set forth" (R. 69). The essential provisions of this agreement are:

1. The licensed field is defined as "(1) All methods, processes and apparatus in the field of manufacture and use of all titanium compounds containing two per cent (2%) or more of the element titanium in a chemically, mechanically or physically combined state, and mixtures thereof, which can be used as pigments, whether or not adapted for other uses, and (2) all such titanium compounds and mixtures which can be used as pigments, whether or not adapted for other uses" (R. 281).[10]

2. TP granted Krebs (a) a non-exclusive license to use within the United States, its colonies and possessions, and for the licensed field, all processes and apparatus of manufacture, patented or not, which it then used or thereafter used during the term of the agreement, and as to which it was free to grant such license; (b) a non-exclusive license to exploit within the same territory and for the licensed field all United States patents then or thereafter owned by it during the term of the agreement; and (c) a non-exclusive license to sell the products resulting from

[10] The definition of licensed field" was subsequently amended specifically to include extender pigments, theretofore included by implication and practice (R. 290).

such processes in the United States, its colonies and possessions, Mexico, Central America, West Indies and South America (R. 281).

3. Krebs granted the identical rights to TP (R. 281).

4. Both parties agreed to exchange technical information, including patent applications and the aims and results of their research and development work (R. 281).

5. Each party agreed to help the other obtain a non-exclusive license for the mentioned territory under any United States patent under which the other was licensed (R. 281).

6. Krebs agreed to give TP's foreign associates the first opportunity to acquire from Krebs a non-exclusive license under any patent issued in Europe or Great Britain within the license field, at the disposal of Krebs (R. 282).

7. The contract was subject to cancellation after December 31, 1933, on three years' notice (R. 282).

8. The parties released each other from claims for infringement of the United States patents then owned or thereafter acquired, during the term of the agreement, with right to sue for past infringement. Each of the parties also released the customers of the other from past infringement claims. (R. 282.)

9. Mutual royalties which could not exceed a total of $40,000 by either party were provided for and no royalties were to be paid by either

party after 1936. (And such royalties were paid.) (R. 282.)

Before this agreement could be executed, it was necessary to secure the approval of NL's foreign associates. IG objected to the proposed agreement because it did not comply with the requirements of Article XIV of the 1920 agreement (R. 282). However, IG withdrew its objection upon the receipt of assurances from DP, and the agreement was approved by IG, Tinc and NL's other foreign associates (R. 287–288). These assurances, which related to the protection of IG in its exclusive territory and the grant of licenses, exclusive in effect, to NL's foreign associates, formed in part the consideration for continued abstinence of the European producers from exporting to the United States (R. 287–288). As a result of them, DP became a party to the worldwide combination (R. 289).

The purposes of NL and DP in entering into their agreement were in some vital respects similar. NL was concerned by the early expiration date of many of the patents upon which it relied. By exchanging patents and technology with DP, a large and powerful corporation possessed of great research facilities, NL expected to strengthen the patent position of NL and DP jointly as against newcomers to the industry. NL also expected to obtain the benefits of a friendly competitor rather than the disadvantages of a hostile competitor. (R. 291–292.)

DP desired to obtain access to the patents and technical experience of NL and its foreign associates, and to strengthen its patent position to the exclusion of others than NL (R. 292). The necessary effects of the agreement have been the achievement of each of these purposes and to give NL and DP together domination and control over the titanium business in the United States, to proliferate patents, and to restrict and obstruct imports into and exports from the United States (R. 292–293). The agreement in substance coincided with the "licensed field" of the 1920 agreement, and also operated on the industry as a whole without respect to the life or scope of any particular patent.

From August 1933 to January 1, 1941, all patents and patent applications within the licensed field owned or filed by TP, NL, Krebs or DP were immediately available to each of them. After January 1, 1941, patent applications were so available only after six months from the date of filing (R. 290). In addition to the patents and applications owned or filed by TP or NL, the patents and applications of NL's foreign associates have also been available to DP (R. 306). Since 1936, all of these patents and applications have been available to NL and DP on a royalty-free basis (R. 282, 303, 306).[11]

[11] DP refused to make a written general agreement for the exchange of licenses on present and future patents between itself and NL's foreign associates because of the United

NL now claims to own or control or be exclusively licensed to use 145 United States patents and applications in the licensed field.[12] In addition, it is licensed to use 186 DP patents and applications. Of the total of 331, NL uses 66 or approximately 20% (R. 250). DP owns 206 patents and applications and is licensed to use 123 patents and applications of NL or its foreign associates. Of the total of 329, DP uses only

States antitrust laws. An oral understanding was reached between DP and NL's foreign associates on June 8, 1938, whereby each of said parties agreed to exchange such of its patents and applications as related to the manufacture and use of titanium pigments within the licensed field of Exhibit E with each other as might be desired by each from the other. In accordance with said oral understanding DP granted royalty-free licenses to Tinc with the right to sublicense NL's foreign associates on June 20, 1938, April 21, 1939, May 10, 1940, and June 23, 1941, and continued to make available to NL's foreign associates, on a royalty-free basis, all patent applications filed by it in the United States relating to the manufacture and use of titanium pigments until a short time before the transmission of such applications was made dependent on the securing of Governmental permission. NL's foreign associates acting in accordance with said oral understanding made all of their U. S. patents and patent applications available to DP via Tinc. This was accomplished through cross-license agreements entered into annually between DP and Tinc on the above dates. (R. 300–302.)

[12] These 145 patents and applications include some transferred to Tinc by TG under the following circumstances: After the outbreak of war in 1939, NL, Tinc and TG believed that if the United States and Germany should declare war, the United States Alien Property Custodian might seize TG's United States patents and the German Government might seize Tinc's German patents, and license them to out-

about 70 or approximately 20% (R. 250–251). The validity of none of these patents has ever been passed upon by any court (R. 249).

NL and DP began exchanging extensive technical information relating in any manner to the manufacture and use of titanium pigments in 1932 while the negotiations leading to the TP-Krebs written agreement (Ex. E) were still in progress (R. 279–280, 289). This exchange continued until May 1940 (R. 289) at which time the titanium pigment business was a mature industry (R. 305). From August, 1933, to September, 1938, DP and NL's foreign associates

---

siders who might compete with the companies in their respective territories. Therefore, NL, Tinc, IG and TG, in order to prevent this potential competition, decided that all of TG's United States patents should be transferred to Tinc, and Tinc's patents in TG's territory should be transferred to TG. Thereupon TG assigned to Tinc some of its United States patents and applications, and Tinc endeavored to reciprocate with respect to its patents in TG's territory. (R. 271.) Thirty-two of the 145 patents and applications were vested by the Alien Property Custodian and are now held by the Attorney General, as his successor. The Attorney General, as successor to the Alien Property Custodian, is not a party to this action and no issue as to his title or his right to administer these patents is involved herein. In view of the district court's special enumeration of the patents vested by the Custodian (R. 320), we do not read the judgment as applicable to them. It is important that the decision of this Court should be without prejudice to the rights and interests of the Attorney General in and to the vested patents or to the jurisdiction of the district court, upon application, to clarify its decree with respect to such rights and interests.

permitted each other to visit their plants and to obtain complete technical information relating to plant operation and equipment. After 1938, DP permitted plant visits from NL's foreign associates but research and development information was excluded from the exchange: (R. 278–299, RE. 1540, 1848–1855, 1898, 1990, 3009, 3086–3095.)

The exchange of information between NL and DP which commenced in 1932 before their agreement was signed was not confined merely to alleged claims of patent infringement or even to what is generally regarded as "know-how" essential to operate under patents. Rather, complete details of plant operation were disclosed to the minutest detail. Information was even exchanged on personnel matters relating to wages, vacations, types of clothing worn, health facilities and safety measures, as well as information on more technical matters such as ore storage and milling, packing, bleaching, wet grinding, pigment washing, materials and supplies consumed, production of waste heat boilers, method of determining iron in titanium dioxide, method of determining tinting strength and consistency of pigments, factors determining the temperature of exit gas, installation of equipment, advantages of certain types of castings and bolts, and a number of other items (RE. 1290, 1878–1885, 1901–1925, 3651–3731).

Neither NL (except as indicated below)[13] or DP have exported titanium pigments to the territory of TG, BTP, SIT, TK, Terres Rares, Thann, Aussig, or Montecatini (R. 289, 303–304) and these companies have not imported such pigments into the United States (R. 289, 304). NL, DP and Tinc have imposed contractual restrictions on resales by purchasers of their pigments, but the court below found that, except as to the years 1940 and 1941, the evidence did not establish that the restrictions imposed by DP were pursuant to an agreement with NL (R. 304, 294).

NL and DP have endeavored to match each other's titanium products, but each manufactures some product having special applications not manufactured by the other (R. 291, 1072–1074, 1149). There is active competiton between NL and DP for customers (R. 290), on the basis of endeavoring to demonstrate that their products merit acceptance because of technical superiority (R. 291). There is no price competition, however. NL and DP sell similar products at identi-

[13] When the war started in Europe in 1939 it became impossible, due to supply shortages and shipment difficulties, for NL's foreign associates to take care of sales in all the countries within their territories. The parties agreed, therefore, that NL and Tinc, upon the request of their associates, would serve the markets allocated to the latter, only for the duration of the emergency, and profits derived by NL and Tinc from the markets so served would be held in trust for the associate in whose market the sales were made. (R. 305, RE. 3338–3416.)

cal prices (R. 291). The trial court found no evidence that such price identity is the result of agreement (R. 291), but did find that an effect of the combination was to maintain prices at a uniform level (R. 304). Since 1927 there have been repeated reductions in prices with few price increases but the trial court stated that it was unable to find whether there was a causal relationship between the increased production at decreased prices and the contracts of NL with its foreign associates (R. 272-273).

An example of the close cooperation that existed between NL and DP is found in the situation relating to the Micronizer Reduction Mill, a patented machine used to improve the texture of titanium pigments (R. 293). NL obtained an exclusive license to use this machine in 1939 from the International Pulverizing Corporation. The machine proved of great value, and DP regarded this apparatus as essential to enable it to manufacture a pigment comparable to the pigment produced by NL by use of the apparatus. NL granted DP a sublicense to use the machine at about the same time that NL obtained its license from the International Pulverizing Corporation. This sublicense was granted pursuant to the 1933 TP-Krebs agreement. It was not until about 18 months later and at the request of the International Pulverizing Corporation (RE. 1832, 1833) that NL also granted a sublicense on the machine

to Zirconium. NL refused to sublicense the apparatus to Virginia Chemical and to the Sherwin-Williams Company. (R. 294; RE. 1834–1840.)

Another instance of NL–DP cooperation is found in their joint purchase, in 1934, of the Leuchs patent, with each company contributing half the cost. Shortly thereafter, DP purchased NL's half interest and gave NL a non-exclusive royalty-free license. NL's technical director believed that the patent was invalid, but he thought it might anticipate a Blumenfeld patent. (R. 293.)[14]

NL and DP have also cooperated on many occasions by furnishing to each other certain types of titanium pigments and much needed ilmenite (RE. 1548–1560).

The only companies other than DP and NL producing titanium pigments in the United States are American Zirconium Corporation (Zirconium) and Virginia Chemical Corporation (VC) (R. 251). Zirconium commenced the manufacture of titanium dioxide in 1934 under patents which it had acquired from its parent corporations, the Glidden Company and Metal & Thermit Corporation (R. 295). Early in 1934 both NL and DP notified Zirconium of probable infringe-

[14] DP acquired the Blumenfeld patents in the United States when it acquired the assets of CP in July 1931 (R. 238). The Leuchs patent U. S. No. 1,853,626 was never used commercially by either DP or NL but was among the patents named in the NL and DP licenses to Zirconium (RE. 261, 289).

ment of their respective patents. Negotiations between NL and Zirconium and DP and Zirconium relating to license agreements followed. (R. 295.)[15] The negotiations between NL and Zirconium resulted in an agreement entered into on May 6, 1935 (R. 295) whereby the parties cross-licensed each other under all present and future patents in the licensed field. Zirconium was required to assume obligations substantially like those in Article 14 of the 1920 agreement, including restrictions on its exports (R. 296). The agreement also provided for an exchange of technical information. NL rendered some engineering assistance to Zirconium and imparted some technical information, but it frequently refused to convey such technology on the ground that other agreements prevented it from so doing (R. 295–296).[16] In lieu of royalties NL received 10 percent of Zirconium's stock and its president was elected to Zirconium's board of directors (R. 295).

---

[15] In the spring of 1935 there was a conversation between Rupprecht for DP and Beschorman for NL respecting Zirconium's patents (R. 296, 845). The DP-Zirconium license was executed on August 10, 1935 though dated January 1, 1935 (RE. 282).

[16] In 1939 Zirconium advised NL of its concern over the fume nuisance created in their operation of the Washburn patents licensed from NL. Zirconium requested permission to witness the operation in NL's plant of the process covered by those patents. NL advised Zirconium that NL's agreements with others prevented them from granting such permission. The inspection was never made (RE. 1718–1727).

The DP and Zirconium negotiations resulted in an agreement signed in August 1935 under which DP granted Zirconium a non-exclusive license under specified patents subject to royalties on titanium dioxide produced (whether or not under DP's patents) and subject to a quantity limitation on the amount of titanium dioxide that Zirconium might produce. Its production was limited to 3,000 tons in 1935 and graduated to 9,000 tons in 1944 and thereafter. (R. 295.) Zirconium produced only pure titanium dioxide and its total production from May 1935 to July 1944 was 33,677 tons (R. 296). On many occasions since the licenses Zirconium has purchased titanium dioxide from NL and DP (R. 1146). Before 1940 NL and DP occasionally exchanged information relative to Zirconium's production (R. 296). Zirconium paid DP approximately $200,000 in royalties (R. 295).

In April 1944 the NL-Zirconium agreement was cancelled and in November of the same year the tonnage limitation provision of the DP-Zirconium agreement was cancelled on the recommendation of DP's legal department (R. 295–296).[17]

VC was organized in 1935 to manufacture titanium pigments and owns certain patents relating to their manufacture and use (R. 245). Late in 1936 and early in 1937 DP and NL re-

[17] The investigation of this industry was initiated in 1943 and antedated the filing of the Complaint in June 1944 (R. 263). NL and DP were, of course, aware of the investigation.

spectively discussed with Virginia Chemical the possibility that the latter might be infringing their titanium pigment patents. The negotiations which followed resulted in agreement between DP and VC executed in August 1937. (R. 297.) The provisions of this agreement were substantially the same as those of the DP-Zirconium agreement. DP granted a non-exclusive license under enumerated patents subject to a royalty payment on all titanium dioxide produced by VC and subject to graduated quantity limitations on VC's production ranging from 3,000 tons for the first year to 9,000 tons in 1946 and thereafter. VC manufactured only pure titanium dioxide and its total production from August 1937 to July 1944 was 36,576 tons. Like Zirconium it paid DP approximately $200,000 in royalties to July 1944. (R. 297.) It purchased titanium dioxide from DP (R. 1146). In November 1944 DP cancelled the quantity limitation provision of the agreement on the recommendation of its legal department (R. 297).

The NL and VC negotiations did not result in an agreement. NL explained to VC its obligations under Article XIV of the 1920 agreement whereby it woud be compelled, among other things, to obligate VC not to compete with the foreign associates of NL. NL was concerned about "the manner of expressing" the obligation it would have to impose on VC if an agreement were en-

tered into. NL communicated with its foreign associates and it was decided that "in the present case" a verbal understanding relating to exports by VC would not be acceptable to the foreign associates (R. 297–298). NL never instituted any action against VC to enforce its claim of infringement (R. 298).

SUMMARY OF ARGUMENT

The defendant's complete control of the titanium industry was acquired by an unlawful combination of patents including those controlling the three originally independent and competing lines of development, by deliberate extension of patents to control the unpatented, by a monopoly of technology, and by agreements of foreign producers not to export to or compete within the United States. Unlawfully operating outside the system of competition the Sherman Act was designed to protect, the defendants have been able to develop an industry pattern, the chief characteristics of which are the concentration of the industry in their hands, complete absence of competition from foreign producers, and uniform prices in the domestic market.

The judgment of the district court permits the existing industry concentration and marketing patterns to continue largely undisturbed. Since the judgment does not neutralize the power by which defendants control the industry, as is re-

quired by the decisions of this Court, it is inadequate to restore the industry to the system of free competition.

I

A. Defendants are required by the district court's decree to grant licenses under their patents to any applicant subject, however, to the payment of reasonable royalties. This provision is inadequate antitrust relief not only because it attempts to give continued vitality to otherwise unenforceable patents but permits defendants to exact a toll from all who would compete with them. Unless defendants are deprived of this power, potential competitors who are already at a serious competitive disadvantage are additionally handicapped to a point where the availability of these patents to them is rendered largely illusory. "Reasonable" royalties amount to a double subsidy to defendants in that defendants would derive profits from all licensees' sales whereas licensees must absorb an additional item of cost not borne by defendants. A decree permitting the defendants to charge royalties leaves in their hands the fruits of their illegal conduct. Since defendants have abused the right to collect royalties as well as the right to exclude, traditional concepts of adequate antitrust relief require that defendants be enjoined from charging royalties for, or otherwise enforcing, the misused patents.

B. The practical difficulty of determining reasonable royalties renders such relief unworkable. The evaluation of patents imposes upon courts "an onerous and absorbing administration burden" for which the courts are not equipped. The fixing of a royalty which will at the same time reward the patentee and instill competition into the industry requires judicial regulation of the future economics of the industry, incompatible with the system of free enterprise.

C. Domination of the titanium industry by defendants has been achieved and maintained primarily by consistent misuse of an aggregation of patents. Such misuse has consisted of the deliberate extension of the several patent monopolies beyond the terms of the authorized grants.

That patents so misused should be rendered unenforceable is compelled by established principles applicable under the patent laws as well as under the antitrust laws. The patent privilege is limited to the invention and any extension beyond the invention renders the patent unenforceable. Protection of the system of free enterprise is the basic rationale of the patent decisions of this Court whether the issue be that of indefinite claims, claims encompassing more than the invention, failure to comply with the disclaimer or reissue statutes, or misuse of patents after issuance. Since the purpose of the antitrust laws, is, also, the protection of free

competitive enterprise, the relief granted by the Court in public proceedings under the Sherman Act must be no less than that accorded to private patent litigants.

D. The decision in *Hartford-Empire Co.* v. *United States*, 323 U. S. 386, is inconsistent with the above principles since it proceeds upon the apparent assumption that equity may not grant adequate relief if the result is destruction of property values. However, traditionally under the patent statutes, the privilege is lost through deliberate attempts to extend the patent privilege beyond the authorized grant, and apart from the decree, defendants here could not enforce their patents because of their misuse. An antitrust decree prohibiting enforcement, therefore, does not confiscate anything of value. Instead of being inconsistent with the defendant's rights under the patent laws, this result is compelled by principles which both the patent and antitrust laws have in common. Furthermore, it is well established that, although equity may not go out of its way to impose penalties, it has power to grant effective relief even though the result may impair property values.

Since defendants' unlawful conduct has established a combination of patents, in place of competition between three originally competitive lines of patents, and has extended patents beyond their authorized scope, it is now impossible to segregate lawful patent values from the values resulting

from defendants' misconduct. Accordingly, as has been determined in similar situations under the patent and antitrust laws, defendants are not entitled to continued enforcement of the abused privileges.

The defendants' patents should be rendered unenforceable for the remaining period of the several grants since the consequences of misuse can never be dissipated while royalties continue to be paid. A decree allowing defendants to reinstate their patents at some future date will inhibit the introduction of new competition.

II

The decree permits the defendants to license their patents upon the condition that the licensee grant them licenses under any patents the licensee now owns or may acquire within five years. Under this provision a competitor who wishes to use a single patent of a defendant must surrender licenses under every patent it owns or acquires within five years. The cumulative effect of these surrenders is to create a pool of patents available to defendants but unavilable to every non-defendant, although only the defendants have violated the law. The provision, therefore, strips competitors of the only competitive advantage they may possess during the crucial five year period while at the same time increasing the already overwhelming competitive advantages of

the defendants. The provision should be eliminated in order that competition in the industry not be forestalled.

III

The district court found that the defendants had acquired a monopoly of the technology of the industry to the detriment of competitors. The judgment, however, limits access to this technology only to licensees of the defendants upon payment of a reasonable charge and only to the extent that it relates to the methods and processes used by the defendant licensor in its commercial practice under a licensed patent or patents. The effect of this provision is to exclude competitors from the general technology of the industry; from the technology necessary to produce unpatentable or unpatented products not produced by a patented process or apparatus; from the technology necessary to the practice of the inventions embodied in expired patents, among which are the basic patents of the industry; and from the technology necessary to practice the invention embodied in any patent not put into commercial practice. The result of this exclusion is to permit the defendants to continue to retain for themselves the technology necessary to produce products falling within the "licensed field", and therefore, within the trade and commerce restrained.

IV

Defendants du Pont and National Lead producing 100% of composite and 90% of pure titanium pigments produced in the United States, acquired domination and control as a result of the unlawful conspiracy. Possessing competitive advantages of tremendous size and capacity, assured sources of raw materials, the cumulated experience and technology of major producers here and abroad, extensive research facilities, trained personnel, established trade connections and good will and probably much lower production costs than other American small producers, defendants National Lead and du Pont have the power to suppress competition of others. This power cannot be neutralized except by partial divestiture of their plants. The power of the Court to order partial divestiture is not limited to cases of fusion. Where this Court has ordered divestiture it has recognized that a competitive industry cannot be restored merely by enjoining the future conduct of units which have unlawfully controlled it, where such units have become so much greater in size than their potential competitors that they may continue to dominate the market by lawful methods of operation. Where such domination has been jointly achieved by two or three large units continued enjoyment of their dominant market position, even acting individually, should be prevented by a divestiture sufficient to a sure elimina-

tion of that position. Otherwise continued concentration of economic power in the hands of a few industrial giants who have demonstrated a clear intention to abuse such power may not be eliminated by Sherman Act suits. If the Act was not intended to eliminate such power, then the Court's recent condemnation of it in *United States* v. *American Tobacco Company* has no effective meaning.

ARGUMENT

INTRODUCTION

A. THE FUNCTION OF AN ANTITRUST JUDGMENT

Each case under the Sherman Act stands upon its own facts and the judgment must be moulded to the exigencies of the particular case. *United States* v. *Union Pacific R. R. Co.*, 226 U. S. 470, 474; *United States* v. *Crescent Amusement Co.*, 323 U. S. 173, 185. It should be designed effectively to dissolve the unlawful combination, neutralize its continuing effects, and prevent its recurrence. *United States* v. *Trans-Missouri Freight Assn.*, 166 U. S. 290, 308; *Standard Oil Company* v. *United States*, 221 U. S. 1, 77–78; *Local 167* v. *United States*, 291 U. S. 293, 299; *United States* v. *Bausch & Lomb Co.*, 321 U. S. 707, 726; and *United States* v. *Crescent Amusement Co.*, 323 U. S. 173. Any doubts in framing its provisions should be resolved against the wrong-doers and in favor of those the Act seeks to protect. *Local 167* v. *United States*, 291 U. S. 293, 299.

In the *Standard Oil* case this Court said (221 U. S. at pp. 77–78):

> It may be conceded that ordinarily where it was found that acts had been done in violation of the statute, adequate measure of relief would result from restraining the doing of such acts in the future. *Swift v. United States,* 196 U. S. 375. But in a case like this, where the condition which has been brought about in violation of the statute, in and of itself, is not only a continued attempt to monopolize, but also a monopolization, the duty to enforce the statute requires the application of broader and more controlling remedies. As penalties which are not authorized by law may not be inflicted by judicial authority, it follows that to meet the situation with which we are confronted the application of remedies two-fold in character becomes essential: 1st. To forbid the doing in the future of acts like those which we have found to have been done in the past which would be violative of the statute. 2d. The exertion of such measure of relief as will effectually dissolve the combination found to exist in violation of the statute, and thus neutralize the extension and continually operating force which the possession of the power unlawfully obtained has brought and will continue to bring about.

This was a clear recognition of the power to neutralize unlawfully created and continually operating forces destructive of the interests pro-

tected by the Act; and of the necessity of exercising that power to grant the proper measure of relief. This is a general principle applicable alike to integrated combinations like that in the *Standard Oil* case and to loose combinations like that in the present case. In each type of case there is an unlawfully created force which will continue operating unless neutralized; and in each type of case operation of the force will continue to deprive the public of the rights the Act was designed to protect.

The opinion in *Hartford-Empire Co.* v. *United States*, 323 U. S. 386, decided one month after the *Crescent* case, *supra*, does not purport to modify this long established principle. Indeed, its approval of compulsory licensing of the defendants' patents at reasonable royalties must have stemmed from an application of that principle. That this is so is suggested by the dissenting opinion of Mr. Justice Rutledge. He said (323 U. S. at p. 440):

> One may start, *with the Court*, upon the basic idea that, in such a proceeding, the decree's function is not to impose sheer "punishment" for past misconduct, but is rather to devise effective measures to prevent its repetition and dissipate its consequence. [Italics supplied.]

B. THE INADEQUACY OF THE RELIEF GRANTED BY THE DISTRICT COURT

The district court in its opinion (R. 222) and judgment recognized the applicability of this principle. The vice of the judgment lies in the fact

that it falls far short of accomplishing the required neutralization.

The district court found that the defendants have unlawfully acquired control and domination over the industry to the exclusion of all actual or potential competitors (R. 304–305). This control was primarily acquired and maintained by an unlawful combination of patents forming "a veritable jungle of patent claims" (R. 221). Some of these patents were acquired from foreign producers partially by a promise by defendants to restrain their foreign trade in a licensed field broader than the claims of all the patents. And all of the patents came into the combination by a mutual desire of the defendants to strengthen their control over the industry. Included among the patents were those controlling the three originally independent and competing lines of development and the later patents of every significant producer in the world, including the proliferated patents which were the inevitable consequence of the unlawful agreements. As a result of the agreements the validity of none has been adjudicated in any court in any country in the world. Some of the patents the defendants recognized to be of doubtful validity. The defendants have used these patents to acquire control of the entire industry, including trade in unpatented products and products not produced by patented processes (*infra*, p. 98). These patents have also been used to control the competition of the only other domestic producers.

The defendants' control of the industry rests also upon their monopoly of the technology of the industry, a monopoly the district court found detrimental to competitors (R. 305). This information includes the accumulated knowledge and experience of every major producer of products within the licensed fields, fields broader than the trade encompassed by the patents. It relates not only to the practice of the inventions embodied in expired or existing patents but to "secret processes * * * which are not patentable or covered by patents" (RE. 1452). The importance of technology varies with different industries. The record here is replete with evidence of its importance in this industry (RE. 1249–1250, 1290, 1540, 1718–1727, 1878–1885, 1898–1925, 2220, 3651–3731). It is supported by the uniform insistence upon exchange of technology as well as patents in each of the many agreements entered into by the conspirators. One of the reasons why du Pont joined the cartel was to acquire this technology. This extreme importance is to be expected in a new industry concentrated in a few hands since its inception where restrictions on availability of technology have been a keystone of a continuing combination which would forever have kept such technology from the public domain.

Still another means by which control was acquired was the agreements of foreign producers to refrain from exporting to and competing in

the United States. Under the judgment of the district court, the foreign producers are released from these agreements. However, it is demonstrable that there will be either no or negligible competition from them. They are located in war-ravaged countries. The record does not show if their plants are in, or can be restored to, production. Furthermore, there is good reason to believe that they will not desire to export in view of their long established policy of non-competition and lack of contacts in this country (R. 948–949). An important factor is that National Lead now owns a substantial interest in and, under the judgment, may acquire the entire interest in most of the major foreign producers.[18]

The defendants' control of the industry, originally based upon an aggregation of patents, a monopoly of technology, and agreements for a world-wide allocation of exclusive territories, now rests in part upon yet another base. The unlawful control of the industry began with its birth in 1920 and has continued beyond the time of its maturity in 1940 to the present. As a result the industry has never been a part of the free enterprise system the Act was designed to protect. Unlawfully operating without that system, the defendants have been enabled to establish an

[18] NL has already applied to the district court for approval of its purchase of the remaining interest in Canadian Titanium Pigments, Limited.

industry and marketing pattern which will permit them to maintain their domination and control and to continue their restrictions upon the freedom of trade and the right to purchase in a competitive market. The chief characteristic of the industry pattern is the concentration of the industry and its control in the hands of NL and DP, corporations of great size and wealth. They are the two largest producers of titanium pigments in the world. Each has two plants strategically located possessing the major bulk of the domestic productive capacity, and assured sources of supply of ilmenite (R. 248). In these plants they produce the entire domestic production of composite pigments and 90% of the production of pure titanium dioxide. They have extensive research facilities, the entire accumulation of technology, and experience. They have trained personnel, trade connections, and established reputations and good will. The marketing pattern of the industry is characterized by price uniformity, a direct effect of the unlawful agreements (R. 304). Competition has been reduced simply to an attempt by NL and DP to demonstrate the superiority of their products.

The effect of the defendants' control, acquired and maintained by the described means, has been to suppress the growth and development of domestic competition with the result that all purchasers of composite pigments and substantially all pur-

chasers of pure titanium dioxide have been required to purchase from NL or DP and at a uniform price.

The scheme of the judgment fashioned by the district court is this: The present industry and marketing patterns are permitted to continue subject only to such changes as may result from provisions intended to permit the growth of competition. As we will show, the provisions designed to permit the growth of competition, do not, under existing factual circumstances, neutralize the defendants' power to suppress competition. On the contrary, the defendants are permitted rights and privileges, including the right to maintain existing industrial and marketing patterns, the combined effect of which is the continuance of their control with the result that the purchasing public is in the same and competitors in substantially the same position as before this action was brought.

I

The Misused Patents Should Be Rendered Unenforceable for Their Remaining Lives

A. Reasonable Royalty Licensing of Misused Patents Is Inadequate Antitrust Relief

The defendants' control of the industry was acquired and is maintained primarily by their patents,[188] *supra* (p. 50). The defendants did not object in the court below to the compulsory

[188] The word "patents" is used to include existing patents and patent applications.

licensing of these patents (R. 1227, 1240). We assume, therefore, that it is conceded that these patents should be available for use by non-defendants. The district court at the request of the defendants included a provision permitting the defendants to charge "a uniform, reasonable royalty" for their use. Subsequent to the entry of the judgment, the trial court stated that it did not believe the defendants should have been permitted to charge royalties and indicated that it permitted them to do so because it felt that under the decision of this Court in *Hartford-Empire Co. v. United States*, 323 U. S. 386, it had no power to do otherwise.[19] We shall discuss this question *infra*, p. 104.

The power created by the possession of these patents will not in fact be neutralized if defendants are permitted any royalty for their use. The right to collect royalties is the power to levy a

[19] In the course of the argument on the motion brought by defendant National Lead to determine reasonable royalties, the following statements were made: (Transcript of hearing on National Lead Motion, October 24, 1946, pp. 55-6).

Mr. WEBSTER: . . . Now, Your Honor has found here first that these two companies dominated and controlled the business of titanium manufactured in the United States, almost in those words. Then you go on to find that they have achieved a monopoly of technical information and that they have achieved that monopoly by virtue, among other things, of proliferation of patents.

The COURT: No doubt about that. I will believe that forever. . . . I will go further than that. *I would have liked to go along on the question of royalty-free patents, but I felt that I hadn't been given the green light on that.* (Italics supplied.)

toll upon all who would compete with the defendants. This toll not only reduces the defendants' costs of production in the amount they collect but increases the costs of the non-defendants who must pay it. If all other items of cost were identical this would still be a serious competitive disadvantage. But the record indicates that the costs of production are not and will not be identical since to some extent at least costs decrease with increased capacity. In 1939 Zirconium then operating on a production quota of 6000 tons per year (RE. 1728) requested du Pont to increase its quota to 9000 tons per year. It advised du Pont that "unless we can increase our volume of production we are faced with definite losses" and "if we could be permitted to increase our production to 9000 tons it would * * * put us on a profitable basis * * * (RE. 1737–1738).

Increased costs must be reflected in higher prices. Since defendants du Pont and National Lead are the two dominant producers of titanium products in the United States, a decree permitting those defendants to charge royalties for the use of their patents could only have a retarding effect upon establishment of competitive conditions in the titanium industry. Coupled with defendants' economic advantages of tremendous size, full line production of titanium pigments, established customer relationships and skilled personnel, is the further impediment to establishment of com-

petitive conditions inherent in the fact that newcomers to the industry or producers not parties to the conspiracy are faced with the necessity of paying tribute to the defendants in the form of royalties which become a part of the fixed cost of operation for such licensees. Conversely, the defendants in the future will have an added element of profit derived from the royalties exacted from other titanium producers. Thus, "reasonable" royalties, in reality, amount to a double subsidy to the defendants in that defendants derive a profit from the sales of all licensees and such licensees must absorb an additional item of cost not borne by the defendants. This royalty, no matter how "reasonable", unescapably must result in placing the defendants in a more favorable competitive position, *vis a vis*, their licensees.

Under such circumstances it can hardly be expected that risk capital will be attracted to new enterprises in the titanium industry and the court's efforts to instill competition will have failed from the start. This is precisely the result which was criticized by Justice Rutledge in his dissent in *Hartford-Empire v. United States, supra,* at 451, wherein he stated, "This Court's revisions of the decree in these respects load upon the industry and the consuming public continuing charges in favor of those who have violated both the anti-trust statutes and the patent laws, a burden which will not end until the last of the

illegally aggregated patents has been expired, if then."

It is to be noted that internecine conflict between the defendants since the entry of the lower court's decree has apparently convinced one of them, defendant National Lead, that reasonable royalty licensing of misused patents in this case cannot be effective or give adequate relief to prevent continued violations of the antitrust laws.[20] After attempting to negotiate reasonable royalties with du Pont respecting each other's patents, National Lead has come to the conclusion that such payments would put du Pont in a position to dominate the industry. If defendant National Lead, the world's largest producer of titanium pigments, finds itself at such

[20] Defendant National Lead in its motion filed in the lower court on October 9, 1946, has conceded, "The Court having found that National Lead and duPont patents and patent applications listed in the appendix attached to the decree were used in unreasonable restraint of trade, they cannot be enforced against infringers, at least until the effects of the illegal restraints have been fully dissipated." (Citing *Morton Salt*, *B. B. Chemical*, and *Mercoid* cases)

"If a patent cannot be enforced against infringers, it is clearly unreasonable to charge a royalty for a license under it.

"It is National's position, therefore, that it is unreasonable to require any applicant to pay a royalty for a license under any of the National or duPont patents or patent applications listed in the appendix attached to the decree and that this Court should so determine." (Petition of National Lead Co. Requesting the Court to Pass Upon the Reasonableness of the Royalty Demanded by Defendant E. I. du Pont de Nemours & Co. for a License Under the duPont Patents Listed in the Final Decree dated October 11, 1945, pp. 10–11).

a competitive disadvantage as a result of reasonable royalty licenses, how can it be expected that any newcomers or the existing independents could hope to survive, much less provide effective competition?

While compulsory licensing of the abused patents upon a reasonable royalty charge has a plausible sound, the attempt to continue or to create in the defendant a qualified patent privilege, inconsistent with the basic right of exclusion granted by the statute, creates more problems than it solves. These problems preclude and go beyond those which required the courts to refuse enforceability to patents claiming more than the invention discussed *infra*, pp. 78–97. Not only have all of the rights granted by the patent statute been exercised as a whole in the past by the defendants to the detriment of the functions of the patent system, but the exercise of these rights has necessarily become embodied in an affirmatively unlawful course of business in which such exercise is an inextricable part.

The Court has not hesitated to strike down in their totality license agreements containing provisions which might be regarded as valid apart from the illegal context in which they were used; the Courts do not attempt to save for the defendants the valid parts of the license agreements, but enjoin enforcement of the entire agreement. (*Interstate Circuit, Inc.* v. *United States*,

306 U. S. 208; *Ethyl Gasoline Corporation* v. *United States,* 309 U. S. 436.) The basis for such holdings is that the Court recognizes the practical impossibility of segregating the legal from the illegal elements of such agreements and at the same time of protecting the public interest in effective termination of the illegal scheme of which they were an integral part. Implicit in these holdings is the further recognition that in the absence of a history of lawful use by the defendants of such agreements the Court is in no position to predict the competitive consequences of such future use. Since the defendants themselves have deliberately deprived the Court of any basis for such an estimate, they are, of course, in no position to insist that one be made for their benefit.

Similarly, any attempt to keep alive for the benefit of the defendants some of the statutory patent privileges which are found to have been illegally used by them in the past also requires an artificial separation of interdependent privileges habitually used as a whole. We submit this is legally and practically impossible of achievement. Thus, in a decree requiring compulsory reasonable royalty licensing the statutory right to sue for infringement of the patent is qualified by partially removing monopoly rights in the hands of the patentee. The patentee no longer retains the essential attribute of the patent privilege,

that of excluding all others except upon his consent but is limited to retention of royalties nebulously defined as "reasonable." This form of relief would appear logically to be predicated on a finding that the only abuse of the patent has been exclusion of competitors by a scheme violative of the Sherman Act. It would appear to presuppose that the right to waive infringement suits upon payment of royalties to the patentee has not been abused.

Yet this analysis is not supported by the facts in the instant case. In the instant case not only have duPont and National Lead concertedly exercised their rights under patents to dominate the titanium industry and to exclude competition (R. 272, 291, 303–6), but also the defendants have granted licenses to two small American titanium producers, American Zirconium and Virginia Chemical, upon condition that the defendants be paid royalties based upon all titanium production of such licensees irrespective of whether the titanium was produced under the licensed patents or under processes not covered by the licensee. Thus not only have abuses occurred with respect to the statutory right to exclude but also with respect to the waiver of this right upon payment of royalties.

Traditional concepts of antitrust relief should, therefore, equally condemn continued exercise of

either right by the defendants. Application of the traditional antitrust policy in the formulation of an equity decree would prohibit assertion of any rights under the patent statutes by the defendants with respect to the abused patents.

It is also apparent that permitting the defendants to charge royalties for the licensing of the patents subject to this decree leaves in the defendants' hands the fruits of their illegal conduct. This also is pointed out by Justice Rutledge in his dissent in the *Hartford-Empire* v. *United States, supra,* at p. 443, in which he stated:

> Every dollar hereafter, as well as heretofore, secured from licenses on the patents illegally aggregated in the combination's hands is money to which the participants are not entitled by virtue of the patent laws or others. It is the immediate product of the conspiracy. To permit these patents to remain in the guilty hands, as sources of continuing lucrative revenue, not only does not deprive their owners of the fruit of their misconduct. Rather it secures to them its continued benefits. The pool may no longer utilize illegal methods. It, and the constituent members, will continue to enjoy the preferred competitive position which their conduct has given them and to use both that position and the ill-gotten patents, together with the patent position, to derive trade advantage over rivals and gain from the public which the patent laws of themselves never con-

templated and the antitrust laws, in my opinion, forbid.

Furthermore, permitting the defendants to charge royalties for the licensing of such patents leaves them with the advantages gained by abuse of the patent privilege. They hold all rights under processes initiated as alternative and potentially competitive means of producing titanium and its pigments and compounds.

No newcomer could undertake to contest the patent position which has been attained by the defendants. The burden of retracing the steps by which the technology of the industry has been built up, to separate what was or is novel in such patent position, and to present such information to the patent office and the courts, if not impossible, is a substantial foreclosure of the field. The illegal actions of the defendants have in the past precluded the step by step testing of such patent position, which is contemplated by the patent laws.

Only by rendering the abused patents unenforceable can the objectives of the antitrust laws and the patent laws again become operative in this industry.

B. UNWORKABILITY OF REASONABLE ROYALTY LICENSING AS ANTITRUST RELIEF

The practical difficulty of providing for reasonable royalties in a background of patent abuse and antitrust violation renders such relief unworkable. These practical considerations, implicit in the

rationale of the rule terminating the enforceability of abused patents, are:

1. That the evaluation of patents as a part of antitrust relief against a background of abuse of patents, imposes upon the courts "an onerous and absorbing administrative burden." *United States v. Crescent Amusement Co.*, 323 U. S. 173, 186.

2. That the fixing of a patent value in terms of a royalty which will at the same time instill competition into the industry and dissipate the effects of monopoly, requires judicial regulation of the future economics of the industry, and is hence incompatible with our system of free enterprise.

The determination by the Court in the *Hartford-Empire* case to permit continued enforceability of the abused patents and the collection of "reasonable" royalty was made without a demonstration to this Court by the parties of the seriousness of such difficulties.[21] However, consideration

[21] The difficulty of determining reasonable royalties, however, has previously been given recognition as one of the objections to practically every Congressional bill for compulsory licensing of patents. Testimony before Committee on Patents, House of Representatives on H. R. 23417 (Oldfield Bill), 62nd Cong., 2nd Sess. (1912), Part XII, p. 11, Part XXVI, p. 26, 29–30; Minority Report on H. R. 23417, 62nd Cong., 3rd Sess. (H. Rep. No. 1161, Part 2); Hearings before Senate Committee on Patents on Stanley Bill, S. 3410, 67th Cong., 2nd Sess. (1922); Hearings before the TNEC, Part 3, Patents, p. 999; Hearings on H. R. 9259, H. R. 9815, and H. R. 1666 before the Committee on Patents, Subcommittee on Compulsory Licensing, House of Representatives,

of these difficulties as illustrated by subsequent experiences in the Hartford case itself, indicates that they constitute an independent ground against permitting any continued vitality in the abused grants.

Valuation of a patent in a proceeding before a master in supplement to other antitrust relief, gives rise to all the problems which accompany any patent accounting. Klooster, *Patent Accountings* (1930); Bennett, *The American Patent System* (1943). The same resort must be made to expert testimony and to evidence regarding the character of the invention, cost of manufacture and marketing, prices, present and future demand, efficiency of producers, etc. *Austin-Western Road Machinery Company* v. *Disc Grader*

75th Cong., 3rd Sess. (March 1938, p. 30); Report of Special Committee of American Patent Law Association, March 15, 1938, with respect to H. R. 9259, 75th Cong., 3rd Sess.

The report of the Subcommittee of the American Bar Association appointed to Consider the King Bill, S. 383, 74th Cong. (1935) makes a typical comment:

"* * * Common experience in patent accountings indicates not only the difficulty of establishing a fair and reasonable royalty in a large proportion of cases, but the unlikelihood that the terms established in the granting of compulsory licenses would prove to be fair in any large percentage of cases. In most cases the initial terms would be fixed before use or sufficient use, so that necessarily the value of the invention and a fair return would be purely speculative. Again, in many instances the patent under which the license would be sought would be only one of a number of patents covering the thing in question. To evaluate that patent fairly would usually be hopeless."

and Plow Company, 291 Fed. 301 (C. C. A. 8); Klooster, *op. cit.*, p. 49 ff. There is the same difficulty of apportioning to the invention only its particular share of the total value of the product, process or apparatus of which it is a part. Klooster, *op. cit.*, Chapter LX. Furthermore, in selecting a comparable unpatented machine device or process for measuring the economic advantage or savings involved in using the patented invention, the problem is raised as to whether such machinery or device infringes the patent in question.[22] Another problem is that of determining the value of unexploited patents and applications or patents and applications for future use. Such prophecy of future value can only be decided on the basis of the most conjectural kind of expert testimony.

The solution of all these problems will necessarily be time consuming and expensive, even more so than the conventional patent accounting proceedings which are notoriously lengthy.[23]

[22] In the *Hartford-Empire* proceedings only one competing manufacturer exists. Its machine, the Liberty feeder was placed on the market in 1942. Counsel for Hartford have indicated that they consider this machine infringes a "substantial" number of the Hartford patents. The court may thus have to decide an infringement suit as a prerequisite to determining reasonable royalties.

[23] "Five years * * * is not too long to estimate for the accounting proceedings," Klooster, *op. cit.* p. 92. The proceedings before the master in the *Hartford-Empire* case will last at least several months. It should also be pointed out that so many matters of dispute have already arisen regard-

Furthermore, since a new invention may develop into unforeseen importance during its patent life or may be rendered substantially obsolete by future inventions, readjustment of royalties may be required from time to time by the court. Vaughan, *Economics of Our Patent System* (1925) p. 243. In fact, there would be no finality to the finding of a reasonable royalty in any sense since it could not be res adjudicata as to any particular applicant. *Goodyear Tire & Rubber Co.* v. *Overman Cushion Tire Co.*, 95 F. 2d 978, 984 (C. C. A. 6).

This burden which is imposed upon the courts in the case of a single or a few patents becomes overwhelming in patent pooling situations, such as in the instant case, where there is a piling of patent upon patent, an aggregation of patents extending across the whole breadth and depth of the industry and its technology. In the instant case the court will have to place a value upon each of 351 patents and applications owned or exclusively licensed to duPont and National Lead. About 200 of these patents and applications contain one or more claims on apparatus or processes used in the manufacture of titanium pigments. Most of them are improvements on the processes and apparatus originally disclosed

---

ing procedure, burden and scope of proof, whether or not the validity of the patents is to be determined, etc., that the *Hartford* case will probably not be concluded until after a further hearing in this court.

in the basic patents now expired. The remaining 150 patents relate to the physical products themselves, which may be roughly classified as Titanium Oxide Pigments, Rutile Pigments, Composite Pigments, Extenders, Titanium Dioxide Plus Inorganic Materials, Zinc Oxide and White Lead plus TiO_2 Pigments, Pigments of TiO_2 plus Organic Materials, Titanates, Seed or Nuclear Materials, Intermediate Products, End Products Using Pigments and Miscellaneous. Of the 351 patents and applications only 66 are commercially used by National Lead and approximately 70 are used by duPont. The value of the commercially used patents and applications will presumably have to be determined by comparison with the unused patents in the aggregation.[24] The difficulty of evaluating these patents is further increased by the fact that the court will have no prior body of evidence or finding of fact to look to for assistance, since one of the effects of the conspiracy has been to prevent entirely patent litigation in the titanium pigment field throughout the world (R. 272).

Obviously, no court can decide arbitrarily that all the patents should be lumped together and a reasonable royalty fixed at an arbitrary figure of, e. g., 2% of the sales price of goods produced under the patents (du Pont's proposal to

[24] e. g., The Leuchs patent, purchased jointly by National Lead and duPont in 1934 which was thought might anticipate a Blumenfeld patent (R. 293).

National Lead). It would be contrary to the patent laws and to the public interest to reward the defendant patentee for more than the actual value of the economic advantages or savings attributable to the inventions covered by his unexpired patent or patents. *Scott Paper Co.* v. *Marcolus,* 326 U. S. 249, 256–7. It is only the "precise essence" of the "advance in the art" for which the patentee may be rewarded. *Mercoid Corporation* v. *Minneapolis-Honeywell Company,* 320 U. S. 680, 683.

This rule must be given strictest application where the defendant patentees have for years illegally dominated the industry and monopolized the art and the artisans. Under the circumstances of the present case, any offhand determination of reasonable royalty could easily reward the defendant patentee for (and burden competitors and the public with the cost of) economic advantages resulting from its high level of know-how rather than from advantages stemming directly and solely from the inventive features of the processes, machinery or products covered by his patents. Furthermore a licensee must be given the right to take a license under only the patent or patents which he may desire, e. g., the competitor who is satisfied to produce something less than the most improved process; or less than a full line of the patented products; or, for a more striking example, the competitor whose own

research has enabled him to develop and patent an entirely independent process or machine which in commercial application infringes upon a minor improvement patent of defendant patentee. In the instant case both independents, American Zirconium and Virginia Chemical, had patents of their own and took licenses under only a part of du Pont's patents. (R. 295, 297.)

This "onerous and absorbing" burden, is not peculiar to the determination of reasonable royalties in the Hartford-Empire and National Lead cases but will be imposed on the courts in every anti-trust case involving patents. In fact, in some antitrust suits where large areas of American industry are controlled patentwise the task would seem impossible.[25]

It is not merely the difficult, burdensome and time-consuming prospect of evaluating thousands of patents in many lawsuits involving countless products, imposed upon the courts which makes the reasonable royalty formula a harmful one. It saddles the courts, the public, the injured parties, and prospective competitors with what may be

[25] For example the Government has presently 5 cases against General Electric Co. involving hundreds of patents covering incandescent and fluorescent lamps and electrical equipment and apparatus of all kinds. In the civil suit pending in the Southern District of New York, *United States* v. *Imperial Chemical Industries, Ltd.*, charging a conspiracy to restrain trade involving a patents and processes exchange agreement, there are estimated to be over 2,000 patents involved covering 4,500 products in the chemical and allied fields.

years of litigation as a method of providing relief against antitrust violations. The days or weeks spent litigating the question whether the antitrust laws have been violated are thus terminated by a final judgment ordering months or even years of further litigation to fix reasonable royalties. The person most likely to gain from such continued litigation is the antitrust violator who has the patents, the monopoly profits, and the monopoly position. The competitor who settles [26] rather than face the expense of such litigation does so on the royalty terms of the antitrust violator, and thus enters or continues in the industry by paying tribute and doing business at the sufferance of the one against whose misuse of patents the judgment was designed to protect him.

A second practical problem of the reasonable royalty formula is that it puts the courts squarely in the position of regulating competition in the industry and of fixing the financial terms upon which new competition can enter the industry. The evaluation of the patent is not the court's only task. In arriving at a reasonable royalty, the

[26] It should be pointed out that determination of royalties by settlement negotiation between the defendants in a patent pooling case is no solution. It would merely be a continuation of conspiratorial activity. Judge Rifkind stated in the hearing on National Lead's Motion to Modify the Decree, that even if duPont and National Lead had agreed on a royalty, the court would still consider it necessary to go through with evaluation proceedings. (Transcript of Hearings, p. 60.)

value of the patent must be qualified and tempered by consideration for the competitor's ability to pay and by consideration for the ultimate purpose of relief, i. e., dissipation of the effects of the patent abuse and the instillation of competition in the industry. Obviously, if the value of the patent is so high as to prevent free and vigorous competition between defendant and competitor then monopoly and restraint by means of valuable patents would render the courts impotent to provide adequate relief. In the Memorandum Opinion of the district court in the *Hartford-Empire* case filed April 3, 1946,[27] the court ordered that a reasonable royalty should be determined "at a figure which will permit continuous competition between the lessor in leasing such machines and an efficient distributor in selling them, or, if the licensor does not also lease machines, then at a figure which will permit the sale of such machines at a reasonable profit by an efficient distributor thereof in a competitive market." The remarks of the district judge with regard to this problem are noteworthy:

> Until the Supreme Court says, in unmistakable terms, that it does not desire to instill competition into the manufacture, sale and distribution of glass making machinery, this Court must assume that the Higher Court does desire competition in

[27] *United States* v. *Hartford-Empire Co.*, 65 F. Supp. 271 (D. C. N. D. Ohio).

the industry and does desire that the illegal combination, resulting in an unreasonable restraint of trade in the glass container industry through the control of machinery used in the manufacture of glass, be dissolved. Perhaps the Higher Court did not fully appreciate the extent of the problem that it was referring to this Court to solve when it ordered that Hartford should be required to license the patents involved for manufacture, use or sale on reasonable terms. What are reasonable terms in a given industry for a license to manufacture and sell certain inventions cannot be arrived at through mathematical formula, nor should they be arrived at through arbitrary judgment or mere guess work. The parties involved herein have attempted to arrive at a definition of "reasonable terms" and they have failed. The Court has no criteria to govern him in arriving at a definition of "reasonable terms" in this particular industry and for this kind and class of machinery. By the terms of the Supreme Court opinion, the Hartford Company is required to license glassware manufacturers to use and machinery manufacturers to make and sell its patented inventions. The royalties charged manufacturers to use can be taken into consideration in arriving at the license fee to be paid by machinery manufacturers to make and sell, but they ought not to govern the establishment of reasonable terms for a license to make and sell. There is nothing

> to prevent the Hartford Company from continuing its established policy of leasing its machinery on a use royalty basis if it so desires, but certainly there is an injunction coming from the Supreme Court to the Hartford Company to license its patents on reasonable terms to all applicants who may desire to manufacture and sell this same machinery. This means, of course, the establishment of competition between the two methods of distributing machinery. The Court is then confronted with the problem of instilling competition into the business of manufacturing, selling and distributing glass making machinery, and at the same time allowing the patentee reasonable compensation for the licensing thereof.

Thus the courts must try to discern in the shifting forces in an industry the fine point at which a royalty rate may be made to coincide with the requirements of competition. It must attempt the difficult task of determining what economic advantage can be given to the defendant by means of royalties without at the same time giving that defendant a competitive advantage which will prevent others from entering or remaining in the industry.

To make that determination, if such a determination is possible, the court must decide how much competition it wants, how efficient a manufacturer must be (in order to sustain the

royalty), what is a fair profit return (over and above the royalty), and if the royalty fixed does not produce the required competition the court must adjust it downward until it does.

Such judicial regulation has been condemned by this court in the price-fixing cases, *United States* v. *Trenton Potteries*, 273 U. S. 392; *United States* v. *Socony-Vacuum Oil Co.*, 310 U. S. 150, where it refused to undertake the task of determining reasonable prices. It should likewise be condemned as a part of antitrust relief in cases involving patents because the determination of a reasonable royalty regulates competition just as surely as determining reasonable prices. In fact this Court has already had occasion to observe that the power to fix royalties "is tantamount to the power to fix prices", *Standard Oil Co.* v. *United States*, 283 U. S. 163, 174. And in the final analysis the determination of reasonable royalties requires a preliminary determination of the reasonableness of the defendants' prices.

In the instant case product patents as well as apparatus and process patents are involved. To determine what is a reasonable burden to impose upon competition, the court must not only determine savings in manufacturing cost arising out of the use of the patented processes and apparatus, but also profits obtainable from the sale of the patented products. Obviously the court can determine the profits attributable to the pat-

ented products only after the most exhaustive study of the past costs and prices and the prospective future sales of duPont, National Lead and the licensees, and even then only after the adoption of one or more accounting and economic theories.

Furthermore in examining profits obtainable from the use of the patents the courts must first consider whether such profits were obtained under monopoly prices.[28] If a royalty is fixed on past profits obtained under monopoly prices, that royalty may be so high as to burden the public thereafter with high monopoly prices. Moreover, the price level will determine the extent to which competitors can compete under the royalty charges. If an existing price level under which the defendant makes high profits is taken as a basis for determining what royalty a reasonably efficient[29] manufacturer can pay and still make a reasonable profit, the defendant can always control competition by the threat of cutting

[28] In the instant case, the court found one of the necessary effects of the conspiracy to be that "prices of titanium pigments and compounds in the United States have been maintained at uniform levels and all competition with foreign producers in the manufacture and sale of titanium pigments and compounds in the United States has been eliminated." (R. 304.)

[29] The problem of determining "efficiency" in an industry which, for twenty years, has been under monopoly control should not be underestimated. The monopolist's own practices are a poor test since there is no incentive for a monopolist to be efficient.

prices to the point where the licensee breaks even (assuming equal costs between them), whereas the defendant under those conditions still has a profit amounting to the royalty on his own sales plus the royalties paid by the competitor. Thus it would seem that if real competition is to be instilled into the industry, and the public protected against monopoly prices, the courts must fix a royalty based upon a price level estimated to return to defendants only a reasonable profit.

It is submitted, therefore, that the fixation of a reasonable royalty is no different from a determination of the court as to whether or not an agreed price is reasonable. The same problems of choice of economic philosophies, and accounting principles exist. There is the same inconstancy of any finding as a result of changing economic conditions. There is the same inadequacy of judicial procedures for making such findings. And more serious, there is the same end result—the dynamics of our economic system determined by judicial regulation rather than by the play of competitive forces in a free market.

In the long line of cases culminating in *Morton Salt* and *Mercoid, infra*, pp. 89–97, the rule was adopted that improperly used patents are unenforceable. This rule reflects the impossibility of reconciling a continued vitality in the abused grant with the purpose of the patent grant in a system of free competitive enterprise.

To attempt to permit a continued vitality in the abused grant by permitting the collection of reasonable royalties and the imposition of other conditions (such as continuing to secure the technology of others by requiring reciprocal licensing of licensees' patents) would not only be to assume that such a reconciliation can be made, but would impose an impractical burden on the courts.

C. THE POLICY OF THE PATENT LAW AS WELL AS OF THE ANTITRUST LAW REQUIRES THAT DEFENDANTS' PATENTS BE RENDERED UNENFORCEABLE FOR THEIR REMAINING TERMS

We have demonstrated that in order to dissipate the effect of the defendants' unlawful conduct and restore a truly competitive structure to the industry, it is necessary that defendants no longer be permitted to collect royalties on their patents here involved. The same conclusion—the unenforceability of the patents so misused—follows if the problem be approached by way of the patent laws. For the anti-monopoly policy of the Sherman Act and the statutory and judicially recognized restrictions on the use of patents are both designed to maintain a competitive economic system, limited only by the exclusive rights of those who use their patents lawfully. Although this is a suit under the Sherman Act, the identity of result under the patent law is important, inasmuch as defendants rely on their

"patent rights" to defeat the Government's contention that the patents be made completely unenforceable for their remaining lives. Furthermore, the theory of the decisions dealing with extensions of the patent privilege beyond the grant authorized by the patent statutes and the holdings in the *Mercoid* cases in particular, see pp. 89–94, *infra,* demonstrate that the same relief should be granted in antitrust suits.

We will show that domination of the titanium industry by the defendants has been achieved and maintained primarily by consistent misuse of an aggregation of patents. Infra, pp. 98–103. Such misuse, in essence, consisted of the deliberate extension of the several patent monopolies beyond the terms and scopes of the authorized grants. That the patents so misused should be rendered unenforceable for the remaining periods of the grants, is, we submit, compelled by established principles applicable alike under the patent laws and under the antitrust laws.

The patent is a grant of special privilege conferred upon inventors by the United States. Its constitutional purpose is to promote the progress of science and useful arts. The scope and terms of the grant are such as Congress decrees for it. Limitations and disabilities inherent in the grant arise from its constitutional purpose and the functions of the patent system in an economy of free competitive enterprise.

The Constitution provides for a patent system "to promote the Progress of Science and useful Arts, by securing for limited Times to * * * Inventors the exclusive Right to their * * * discoveries". Art. I, Section 8, Clause 8. The patent statutes grant to the patentee a right to exclude others from making, using, or vending his invention. 35 U. S. C. § 31. Basic under both the constitutional sanction and the statutory grant are the limitations: (1) only a right to exclude is conferred and (2) such right of exclusion is restricted to the invention or discovery.

These limitations are essential to the functioning of the patent system. The system operates by granting to the inventor a period during which he may exercise a right to exclude from his invention in exchange for disclosure of such invention. The purpose of disclosure is two-fold: (1) to insure the ultimate dedication to the public of the invention and the means of its practice and application and (2) to inform others of the limits of the grant, of the line between what is open for invention and development and what has for a limited time been preempted by the patentee. *Universal Oil Products Co.* v. *Globe Oil & Refining Co.*, 322 U. S. 471, 484. Such disclosure takes the form of the specifications and claims in the patent. The claims must be responsive to the prime condition upon which a patent is issued to

the patentee, he must "particularly point out and distinctly claim the part, improvement, or combination which he claims as his invention or discovery". Revised Statutes, Sec. 4888, 35 U. S. C. § 33. Sharp definition of the invention is essential to prevent the issuance of colorable grants. Such grants would establish monopolies for subjects beyond the invention, would prevent competition in the development of technology and would result in privilege to monopolize derogating from the public domain where no grant should be issued. Only by adhering to the limitation that the privilege is limited to the invention or discovery can the patent system be kept within its proper function.

The underlying rationale for limiting the patent privilege to the invention has always been a part of our patent system. Whenever the patentee attempts to secure or assert a monopoly beyond his invention, "he prevents others from attempting to improve upon the manner and process which he has described in his specification—and may deter the public from using it, even if discovered. He can lawfully claim only what he has invented and described, and if he claims more his patent is void". *O'Reilly* v. *Morse*, 15 How. 62, 120–121.

Without limiting the privilege to the invention both in the grant and in the use, the constitutional

purpose of the patent grant is defeated and the patent system would conflict with the basic public policy against restraints of trade and monopoly which predates and is incorporated in the Sherman Act. Without such limitation the incentive to invent sought to be encouraged by the patent system would be perverted to an incentive to secure sanctions for illegal restraints of trade. *Mercoid Corp.* v. *Mid-Continent Co.*, 320 U. S. 661, 666.

The public policy enunciated in the constitution, the patent statutes and the decisions of this Court, limiting the patent privilege to the invention or discovery, is the dominant norm for adjudication of the scope and disabilities of the patent privilege. The limitation assures alike that the privilege will not be used to create monopolies beyond the invention in contravention of the antitrust laws and will not be used to bar the development of further and competitive technologies or the utilization of available technology as contemplated by the patent system.

It is a necessary and inevitable consequence of the public policy which limits the patent privilege to the invention that the patent is rendered unenforceable for its remaining life where it is used to extend the privilege beyond the invention for which the grant is authorized. Such extension creates situations which cannot be rectified under

the antitrust and the patent laws merely by prohibiting the abuse and permitting the privilege to continue. The past and future effects of loss of opportunity for others to invent, the uncertainty as to general commercial rights, the deterring of others from legitimate action together with the inseparability of past abuse from future operation of the patent system in this field necessitates complete unenforceability of the patent privilege where it has been claimed for more than, or extended beyond, the authorized grant. Several lines of authority converge to sustain this proposition.

Regardless of the manner in which private litigants have posed the issue of the relative importance of the public interest in the patent system as contrasted to the convenience or commercial interests of the patentee, the Court has consistently refused to apply ordinary principles of estoppel or other common rules of contract law where the application might lead to a result injurious to the dominant public interest in maintaining the integrity of the patent system. Thus the Court has refused to foreclose a private litigant from contesting the validity of a patent even though he had previously attempted to secure a similar patent, *Haughey* v. *Lee,* 151 U. S. 282; *Paramount Publix Corporation* v. *American Tri-Ergon Corporation,* 294 U. S. 464; even though

he had not exercised a high degree of diligence in making the claim of invalidity, *Hazel-Atlas Co.* v. *Hartford-Empire Co.*, 322 U. S. 238; or had taken a restrictive license from the patentee, *Sola Electric Co.* v. *Jefferson Electric Co.*, 317 U. S. 173; *Edward Katzinger Co.* v. *Chicago Metallic Mfg. Co.*, Nos. 70, 71, this Term, decided January 6, 1947. And in *Scott Paper Co.* v. *Marcalus Manufacturing Co.*, 326 U. S. 249, the primacy of the public interest in the patent system was reaffirmed under circumstances which make it perfectly clear that conventional doctrines applicable to the disposition of property rights created by private contract have a very limited application to the disposition of patent rights. In that case the Court refused to apply the doctrine of private equitable estoppel to prevent an inventor who had assigned his patent from claiming as against his assignee that he had in fact invented nothing in securing the patent in question, but had merely copied an expired patent. The public interest in securing the rights of all the public, including in this instance the specious inventor, to the practice of expired patents was held to override the principles of equitable estoppel which govern transactions in private property. Similarly the Court has refused to enforce a contract which required the licensee not to contest the validity of certain patents under which he was not licensed. *Pope Manufacturing Co.* v. *Gormully*, 144 U. S. 224. Furthermore, since the

question of validity of a patent is of much greater public importance than the question of infringement by a particular litigant, the Court has criticized a tendency of the lower federal courts to dispose of infringement suits upon the ground of non-infringement without passing upon the question of the validity of the patent. *Sinclair Co.* v. *Interchemical Corporation*, 325 U. S. 327.

In thus protecting the public interest dominant in the patent system this Court has repeatedly refused to enforce a patent used to monopolize or claim more than the invention, with no suggestion that such a result confiscated any property rights.[30] Thus where an applicant for a patent has failed to "particularly point out and distinctly claim the part, improvement, or combination which he claims as his invention or discovery," 35 U. S. C. § 33, the Court has refused enforcement, recognizing that "to sustain claims so indefinite as not to give the notice required by the statute would be in direct contravention of the public interest which Congress therein recognized and sought to protect." *United Carbon Co.* v. *Binney Co.*, 317 U. S. 228, 233. Or as was said in *Universal Oil Products Co.* v. *Globe Oil Co.*, 322 U. S. 471, 484, "the claim is required to be specific for the very purpose of protecting the public against extension of the scope of the patent." So too,

[30] See also *General Electric Co.* v. *Wabash Co.*, 304 U. S. 364; *Evans* v. *Eaton*, 7 Wheat. 356; *Brooks* v. *Fiske*, 15 How. 212.

the patent privilege is lost if the claims made in application or grant go beyond the invention (*Marconi Wireless Telegraph Co.* v. *United States*, 320 U. S. 1), for otherwise "the patent monopoly would thus be extended beyond the discovery and would discourage rather than promote invention." *Holland Furniture Co.* v. *Perkins Glue Co.*, 277 U. S. 245, 257.[31] If the invention and the method of its practice are not fully stated, the patent is invalidated *in toto*. *General Electric Co.* v. *Wabash Co.*, 304 U. S. 364. Similarly, any claim designed to deceive or mislead the public invalidates the entire patent. *Turner* v. *Winter*, 1 T. R. 602, 605 (1787); *Carlton* v. *Bokee*, 17 Wall. 463, 472. The Court will refuse to accord the patent privilege to an invention which includes the old with the new, as it was not the intention of the patent law "to take from the public, that of which they were fairly in possession. * * * it would be extremely impolitic, to retard or embarrass this advance, by withdrawing from the public any useful invention or art, and making it a subject of private monopoly." *Shaw* v. *Cooper*, 7 Pet. 292, 320. Nor may a patentee lengthen the period of his monopoly by withholding knowledge of his invention, yet work it commercially, and then at a later date apply for

[31] See also *O'Reilly* v. *Morse*, 15 How. 62.

a patent to forestall the danger of competition. *Pennock* v. *Dialogue*, 2 Pet. 1; *Woodbridge* v. *United States*, 263 U. S. 50.[32]

The only escape which the law allows to the person who claims more than his invention is a timely correction before the Patent Office and a showing that the excess or exaggeration in the claims were due to mistake, accident or inadvertence: Rev. Stat. §§ 4917, 4922; 35 U. S. C. 65, 71. Under the general rule a patent with an invalid claim is wholly void, the purpose being the "protection of the public from the threat of an invalid patent." *Marconi Wireless Telegraph Co.* v. *United States*, 320 U. S. at p. 58. To invoke the protection of the disclaimer statute, the patentee must conduct himself strictly in accordance with its terms. "Escape is permitted only to one who acted originally in good faith and who has complied with the prescribed conditions." *Ensten* v. *Simon, Ascher & Co.*, 282 U. S. 445, 452. The Court has strictly enforced the requirements of the disclaimer statute and where it has found a failure to comply with its specifications the patentee has lost his entire grant, including his rights under the otherwise valid claims of his patents. The Court has not permitted reformation of the claims so as to describe solely that which was true

[32] See also *Metallizing Engineering Co.* v. *Kenyon Bearing Co.*, 153 F. 2d 516 (C. C. A. 2).

invention nor has it concerned itself with the question whether such loss of an exclusive right in the invention constitutes a confiscation of property rights. The Court in *Altoona Theatres* v. *Tri-Ergon Corp.*, 294 U. S. 477, 493, indicating that it gives no weight to a consideration of confiscation of property rights in cases involving abused patents, has stated "the settled rule that unreasonable delay in making a disclaimer invalidates the whole patent * * * rests upon the similar principle that misuse of the patent, or a part of it, by the patentee in such a manner as to mislead the public or operate to its detriment, deprives the claim of the benefit of the patent laws."

Nor has the Court been concerned where a patentee has lost his patent privilege by failure to comply strictly with the terms of the reissue statute. Rev. Stat. § 4916; 35 U. S. C. § 64. By its terms a patentee may surrender a defective patent and obtain a reissue only upon a showing of inadvertence, accident or mistake and such reissue must be sought without delay. The Court has been quick to point out the damage to the public interest which would result from a loose application of this statute holding that the grant of a reissue "after an unreasonable delay, is clearly an abuse of the power to grant reissues and may justly be declared illegal and void. It will not do for the patentee to wait until other

inventors have produced new forms of improvement, and then, with the new light thus acquired, under pretence of inadvertence and mistake, apply for such an enlargement of his claim as to make it embrace these new forms. Such a process of expansion carried on indefinitely, without regard to lapse of time, would operate most unjustly against the public, and is totally unauthorized by the law. In such a case, even he who has rights, and sleeps upon them, justly loses them" *Miller* v. *Brass Co.*, 104 U. S. 350, 355.

And in a now famous line of cases beginning with *Motion Picture Co.* v. *Universal Film Co.*, 243 U. S. 502, and culminating with *Mercoid Corporation* v. *Mid-Continent Co.*, 320 U. S. 661,[33] the Court has condemned any attempt after issuance of the patent to monopolize the unpatented by use of the patent privilege. These decisions have not been predicated upon any failure to comply with the statutory requirements of the patent laws. The Court in these cases has denied enforceability to the patent privilege where the basic limitation of the grant to the invention has been disregarded by the patentee or those claiming under him. The Court has recognized that the evils of extending the patent grant beyond the

[33] See also *Carbice Corp.* v. *American Patents Corp.*, 283 U. S. 27; *Leitch Mfg. Co.* v. *Barber Co.*, 302 U. S. 458; *Morton Salt Co.* v. *G. S. Suppiger Co.*, 314 U. S. 488; *B. B. Chemical Co.* v. *Ellis*, 314 U. S. 495.

authorized right to exclude from an invention, are the same and require the application of the rule of unenforceability wherever and however the abuse of the privilege occurs. No matter how the question arises the evil is "expanding the patent beyond the legitimate scope of its monopoly" (*Mercoid Corp.* v. *Mid-Continent Co., supra*, 665), with the attendant interference in the functions of the patent system and injury to the public. The Court has recognized the fundamental similarity in the injury to the public arising from patents claiming more than the invention and the use of patents to monopolize or control competition in the unpatented by stating that "the public policy which includes inventions within the granted monopoly excludes from it all that is not embraced in the invention. It equally forbids the use of the patent to secure an exclusive right or limited monopoly not granted by the Patent Office and which it is contrary to public policy to grant." *Morton Salt Co.* v. *G. S. Suppiger Co.*, 314 U. S. 488, 492.

In the *Mercoid* case (320 U. S. at 665) the Court pointed out that the basic rationale of the Court's decisions which "alike nullifies a patent where any part of it is invalid * * * and denies to the patentee after issuance the power to use it in such a way as to acquire a monopoly which is not plainly within the terms of

the grant" is "the protection of the public in a system of free enterprise". We submit that this rationale is basic to the cases which have been herein reviewed; that it is fundamental and applicable whether the issue has been that of indefinite claims, claims encompassing more than the invention, failure to comply strictly with the disclaimer statute or the reissue statute, or misuse of patents after issuance. The Court has recognized that the threat to a system of free enterprise and the distortion of the patent system which results from such abuses requires unenforceability of the privilege where it has been extended or exercised beyond the authorized grant.

The purpose of the antitrust laws also, of course, is the protection of a system of competitive free enterprise.

In *Mercoid Corp.* v. *Mid-Continent Co.*, 320 U. S. 661, and *Mercoid Corp.* v. *Minneapolis-Honeywell Co.*, 320 U. S. 680, the Court was called upon to determine the consequences flowing from the misuse of a patent in violation of the antitrust laws. There the Court recognized that the rationale of the rule rendering improperly used patents unenforceable was applicable alike under the patent laws and the antitrust laws. In the first case, *Mercoid Corp.* v. *Mid-Continent Co.*, Mercoid, in answer to a suit for contributory infringement, alleging misuse of

the Cross patent in violation of the antitrust laws; and in the second case, *Mercoid Corp.* v. *Minneapolis-Honeywell,* Mercoid, charging a use of the Freeman patent in violation of the antitrust laws, sought affirmative relief against respondents in the form of injunctions against infringement suits and treble damages. In the first decision, holding that attempts to control competition in an unpatented device forming an integral part of the combination patent constituted a misuse of the patent, the Court again restated the threat to the integrity of the patent system and to the maintenance of the antitrust laws presented by such misuse, as follows (pp. 667, 668):

> But the fact remains that the competition which is sought to be controlled is not competition in the sale of the patented assembly but merely competition in the sale of the unpatented thermostatic controls. The patent is employed to protect the market for a device on which no patent has been granted. But for the patent such restraint on trade would plainly run afoul of the anti-trust laws. If the restraint is lawful because of the patent, the patent will have been expanded by contract. That on which no patent could be obtained would be as effectively protected as if a patent had been issued. Private business would function as its own patent office and impose its own law upon its licensees. It would obtain by contract what letters patent alone may grant. Such a vast power to multiply monopo-

> lies" at the will of the patentee * * * would carve out exceptions to the anti-trust laws which Congress has not sanctioned. * * *
>
> * * * If a limited monopoly over the combustion stoker switch were allowed, it would not be a monopoly accorded inventive genius by the patent laws but a monopoly born of a commercial desire to avoid the rigors of competition fostered by the anti-trust laws. If such an expansion of the patent monopoly could be effected by contract, the integrity of the patent system would be seriously compromised.

In *Mercoid Corp.* v. *Minneapolis-Honeywell*, *supra*, the Court expressly recognized that the misuse of the Freeman patent constituted a violation of the antitrust laws and that Mercoid was entitled to affirmative injunctive relief against the patentee, stating (p. 684), "For the reasons stated in *Mercoid* v. *Mid-Continent Investment Co.*, *supra*, the effort here made to control competition in this unpatented device plainly violates the anti-trust laws, even apart from the price-fixing provisions of the license agreements. It follows that petitioner is entitled to be relieved against the consequences of those acts." The decree entered in these two cases in the District Court pursuant to the mandate of the Supreme Court effectively protect the Mercoid Corporation from further misuse of the patents by Minneapolis-Honeywell and Mid-Continent Investment

Co. and render the patents unenforceable, without time limitation, as against Mercoid.[34]

We submit that the application of the doctrine of unenforceability of patents misused in violation of the antitrust laws in suits between private litigants demonstrates that similar relief is appropriate in suits instituted by the Government under Section 4 of the Sherman Act to restrain and prevent continued violations of the Sherman Act. The principal significance of those two cases lies, we believe, in their demonstration that the same basic rationale which renders abused patents unenforceable is operative alike under the patent statutes and the antitrust laws.

[34] In *Mid-Continent* v. *Mercoid*, Civil Action No. 2070, the District Court pursuant to mandate entered a final judgment on April 10, 1944, enjoining Mid-Continent Investment and Minneapolis-Honeywell Regulator Company from instituting or threatening to institute suits for contributory infringement of the Cross patent against Mercoid's customers, "or from in any manner interfering with defendant's business by use of the Cross patent;". Mid-Continent and Minneapolis-Honeywell were enjoined from engaging in or carrying out the conspiracy and combination in restraint of trade found by the Supreme Court or from engaging in any similar conspiracy involving the Cross patent. The patentees were further enjoined from enforcing or carrying out any of the provisions of the exclusive license or the sublicenses declared illegal in the Court's opinion and were enjoined from enforcing or carrying out any similar licenses involving the Cross patent. The complaint of Mid-Continent Investment Company and Minneapolis-Honeywell Regulator Company was dismissed. The Mercoid Corporation was also allowed treble damages and a master was appointed to ascertain the amount of damages suffered by Mercoid. [Footnote continued on next page.]

The public interest in patents has led this Court not to apply the doctrines which ordinarily govern private litigation. See pages 83–84, *supra*. No such obstacles impede the protection of the public interest in suits by the United States, on behalf of

In *Mercoid* v. *Minneapolis-Honeywell*, Civil Action No. 1839, the District Court pursuant to the mandate of this Court entered a final judgment on March 16, 1944, adjudging that Minneapolis-Honeywell had misused the Freeman patent in violation of Sections 1, 2 and 14 of the antitrust laws; decreed that the complaint of Minneapolis-Honeywell be dismissed; and issued an injunction perpetually restraining Minneapolis-Honeywell from granting any license to use the combination claimed by the Freeman patent where such use is conditioned on purchasing from Minneapolis-Honeywell or from sources designated by it any parts or devices to be used in combination but not patented by the Freeman patent. The Court also enjoined Minneapolis-Honeywell from selling any part or device with an understanding that the purchaser will be granted the right to use the Freeman combination patent on condition that such part or device shall be purchased from Minneapolis-Honeywell or from a source designated by it. Minneapolis-Honeywell was also enjoined from discriminating in the granting of licenses under the Freeman patent between users of such combination who purchase parts from Minneapolis-Honeywell or a source designated by it and such users who purchase such parts or devices from any other source. In addition Minneapolis-Honeywell was enjoined from so using the Freeman patent as to tend to create a monopoly in a part or device not patented by such patent or in any way misusing such patent in violation of the antitrust laws. Also enjoined were suits, or threats of suits, against customers of Mercoid for alleged infringement of the Freeman patent on account of the sale or use of devices obtained from Mercoid prior to the date of the judgment. Mercoid was allowed treble damages against Minneapolis-Honeywell and a special master appointed to ascertain the amount of damages.

the public, under the Sherman Act. The relief granted by the court in private patent litigation to protect the public interest as a matter of course dictates that the relief granted in public proceedings under the Sherman Act must be no less.

The instant case, brought under Section 4 of the Sherman Act necessarily involves more than mere injury to private parties and consequently the relief granted must give effective protection to the general public. We submit that in such suits this protection can only be had by a decree which enjoins the defendants from the future exercise of any of the rights granted by the patent statutes with respect to the patents misused in the unlawful conspiracy or monopoly. This implies no departure from or extension of the doctrine of future unenforceability by a misuser of the patent privilege established in the private litigation and infringement cases cited above. It is a recognition that the doctrine is based on an underlying public policy from which definite disabilities on patents have developed and are applied.[35]

[35] See Mr. Justice Rutledge's statement of this policy in his dissent in *Hartford-Empire* v. *United States*, 323 U. S. 386, 452–3:

"The general policy has been to restrict the right of the patent-holder rigidly within the terms of his grant and, when he overreaches its boundary, to deny him the usual protections of the holder of property. That this ordinarily has been done in infringement suits or suits for cancellation does not

The majority opinion in the *Hartford-Empire* case, 323 U. S. 386, apparently did not consider the applicability of the foregoing principles to patent rights standing alone. That opinion and the clarifying opinion, 324 U. S. 570, were primarily concerned with the effect of the judgment on past as well as future royalties which included past payments for rental of machinery and for servicing such machinery. Hence, a forfeiture of payments for products and services not fully covered by the patents was thought to be involved which suggested a confiscation of property rights not granted by the patent statutes.

It should be borne in mind that the application of the principles reviewed in the foregoing decisions is limited in this case to a prohibition against enforcement by the defendants of the misused patents quite apart from any relief relating to charges for machinery or services which were involved in the *Hartford-Empire* case.

---

qualify the fact or the policy. * * * When the patent-holder so far overreaches his privilege as to intrude upon the rights of others and the public protected by the anti-trust legislation, and does this in such a way that he cannot further exercise the privilege without also trespassing upon the rights thus protected, either his right or the other person's, and the public right must give way. It is wholly incongruous in such circumstances to say that the privilege of the trespasser shall be preserved and the rights of all others which he has transgressed shall continue to give way to the consequences of his wrongdoing."

D. THE DEFENDANTS HAVE DELIBERATELY EXTENDED THE PATENT PRIVILEGE BEYOND THE AUTHORIZED GRANT

The defendants' abuse of the patent privilege was not limited to single acts or to a series of acts but comprehended the entire industry, its present and future production, technology, markets and participants. The conspiracy was initiated at the time when three alternative processes for the production of titanium pigments were being developed. It resulted in the elimination of all competition in the development of these processes for commercial use. Eligibility to participate in the industry was conditioned upon the terms which conspirators had established for patent licenses and "a business, originally founded upon patents which have long since expired, is today less accessible to free enterprise than when it was first launched" (R. 221). The original patents have been extended to control over all the products and to all uses, compounds, and mixtures of titanium.

As a condition to the waiver of the right to exclude from the practice of the inventions covered by existing patents the parties to the conspiracy have, by private arrangement, extended the existing patent monopolies to restrain and monopolize subject matter and activities unprotected by the several patent grants. They have in fact accomplished all the advantages to

themselves and disadvantages to others which the rule limiting the grant to the invention seeks to prevent. The parties have tied as a condition to the exchange of exclusive licenses under existing patents a requirement that all future patents relating to the broad field of the titanium industry be exclusively licensed to the conspirators.

The parties have extended their existing patent monopolies by giving to them extraterritorial effect. Accordingly, the markets of the world have been divided into exclusive domains, each of which has been allocated to one or several of the conspirators. Existing patents monopolies have been extended to restrict or prohibit the exportation and importation not only of patented products but unpatented and unpatentable products. Exportation of titanium products has been prohibited even to countries where no system of patents exists. Marketing restrictions have been predicated on patent grants which even the parties themselves have recognized as of doubtful validity. To make doubly sure that the territorial allocations were respected, the parties to this conspiracy have been designated, each for his own respective territory, the exclusive agent for the marketing in such territory of titanium products produced by the other parties, such sales to be at prices and on terms determined by such exclusive agent. Disposition of titanium products after sale by the cartel parties has been

regulated to the end that customers of the cartel might not disturb the market allocations.

Licensing has been conditioned upon reciprocal undertakings to furnish all present and future "know-how" to the cartel parties.

The restrictions invoked by the parties as a condition to the waiving of the right to exclude extended beyond the life of any then existing patent.

By mutual agreement new parties to the cartel could gain access to the pooled inventions only upon condition that they would accede to all the above restrictions. Thus the new party was licensed under the pooled patents of the cartel only upon condition that such licensee would contribute to the pool not only his existing patents but also his future inventions, that he would obey the allocation of world markets and confine his activities to the market reserved to him, that he would impart to the cartel all his present and future technological information relating to the titanium industry.

Small American companies interloping in the American titanium market gained freedom from patent intimidation only upon accepting tonnage restrictions. Payment of substantial royalties has been based upon all titanium produced whether by utilization of the licensed inventions or by use of processes not subject to the licensed patents.

The abuse of patents occurred not only in their use after issuance by the Patent Office. Competition in the acquisition of patents was also proscribed in that defendants du Pont and National Lead adhered to the policy of privately determining which had priority in respect of patent claims which were the subject of interference proceedings in the Patent Office. (Motion of Defendant National Lead for Determination of Royalties, dated October 9, 1946, p. 9). The patent statutes contemplate issuance of patents only to the first inventors. Interference proceedings in the Patent Office are a means of assuring this result as well as avoiding the issuance of otherwise improper patents. This requirement has been disregarded and these safeguards nullified by defendants' program to eliminate all interference proceedings among themselves. As to existing patents and as to patents not then in existence the parties agreed never to contest their validity. By such activities the parties to the conspiracy eliminated the chief source of private resistance to the grant of improper patent monopolies (R. 221). The inevitable consequence has been a proliferation of patents uncontested in the Patent Office and untested by the courts. By multiplying monopolies, patents long since expired have retained their attribute of exclusivity by virtue of the pooling arrangements. In practical effect there has been no dedication to the domain of public tech-

nology of the subject matter covered by the expired patents.

The elimination of competition in the development of technology, the proliferation of uncontested patents, the conditioning of eligibility to enter industry or to utilize its products on the licensing terms fixed by the cartel, and the projection of the original patents to control all future developments in the industry represent all the evils which the principle limiting the patent privilege to a right to exclude from the invention, and only the invention, seeks to prevent. The defendant's activities have resulted in consummation of what the Court feared when in *United Carbon Co.* v. *Binney Co.*, 317 U. S. 228, 236, it said: "A zone of uncertainty which enterprise and experimentation may enter only at the risk of infringement claims would discourage invention only a little less than unequivocal foreclosure of the field." Here the defendants, through their abuse of the patent privilege, have not only created a zone of uncertainty as to the scope and status of technology in the titanium field, but have succeeded in foreclosing the field and securing the inventions of others for their own use. The constitutional purpose of the patent system has thus been completely nullified.

It is now impossible to restore the research, which could have been done, to recreate the in-

centive to invent, or to revitalize the prod of fear of competitive technological development which would have existed if the operations of the patent system had not been distorted by the defendants. It is impossible here, just as it is impossible where distortion of the patent system occurs by indefinite or unjustified claims, to reach back through time and withdraw from the course of events the evil effects on the patent system of the defendant's abuse of patents to achieve a complete monopoly of the industry. To maintain the future integrity of the patent system and to prevent continuance of the monopoly, complete unenforceability of the abused patent is as essential here as in any other of the situations where unenforceability results from extension of the privilege beyond the authorized grant.

Certainly, if a private litigant demonstrated these abuses in defense to an infringement action brought by these defendants, the courts would have refused enforcement of the misused patents and granted affirmative injunctive relief against future enforcement of the abused patents in accordance with the doctrine of the *Mercoid* cases. *A fortiori*, the Government should be accorded at least commensurate relief in this proceeding if the effectiveness of the antitrust laws is to be maintained and the integrity of patent system preserved.

E. THE HARTFORD-EMPIRE CASE IS INCONSISTENT WITH THE ABOVE PRINCIPLES AND SHOULD BE OVERRULED.

In *Hartford-Empire Co.* v. *United States*, 323 U. S. 386, the Court, speaking through less than a majority of the full membership, set aside the provision of the district court's decree requiring that the patents misused by the defendants be licensed royalty-free in the future. The reasoning of the opinion was (p. 414):

> Since the provisions of paragraphs 21 to 24 inclusive, in effect confiscate considerable portions of the appellants' property, we think they go beyond what is required to dissolve the combination and prevent future combinations of like character. * * *

The quoted passage seems to say that a court of equity may not order adequate anti-trust relief if the result would be that property values are destroyed. Such a theory, we submit, is in conflict with well-established principles of equity jurisdiction, applied in anti-trust cases and elsewhere. Furthermore, the premise upon which application of the theory rests is defective, inasmuch as misused patents cannot be enforced and hence have no value to be confiscated.

It is to be noted that in this case, as distinct from the *Hartford* case, in which Hartford was dependent for its revenues mainly on the royalties from its patents, the world-wide pool of patents

has been largely created through an exchange of royalty-free licenses (Findings 44, 48, 60 and 73; R. 251–254, 255–256, 270, 280–289). The cross-licensing arrangement between DuPont and National Lead initially provided for mutual royalties but no royalties were paid after 1936 (Finding 73). Thus income from royalty-bearing licenses under the defendants' patents has not been the objective that the defendants customarily have sought. Yet the decree in this case seeks to assure the defendants a reward, which they have never had before. To deprive the defendants of this new opportunity to use the antitrust decree against them as a basis for expanding their revenues from the misused patents can hardly be confiscatory.[26]

[26] In its petition in the district court (see p. 58, supra), National Lead has stated: "Moreover, it is solely because of the Government's successful prosecution of this case that DuPont is enabled to demand any royalty from National. Had no case been started, or had the Government been unsuccessful, DuPont would not be in a position to collect any royalty from National. Stated in its simplest terms, therefore, DuPont's position comes down to this: As a result of a trial in which the Government has satisfied the Court that National and DuPont were together guilty of conspiring to violate Section 1 of the Sherman Act, DuPont proposes to extract millions of dollars from co-defendant National, a tribute which duPont would not be allowed to collect but for the Government's success in establishing the guilt of both companies. This absurd result cannot be the purpose of the decree. If such a result is achieved, it can truly be said that DuPont, and not the Government, won the case."

a. *To prevent the collection of royalties on unenforceable patents is not confiscation*

We have demonstrated in II that the patent and antitrust laws combine to render unenforceable patents which have been misused. The *Mercoid* cases, in which the patentee was both denied the enforcement he sought as plaintiff and enjoined under the Sherman Act, best illustrates the inseparability of the two approaches.

Since a patent, unlike physical property, is only a right to exclude, it has no value if the patentee cannot enforce that right. An antitrust decree which prevents enforcement of misused patents which the patentee could not enforce in private litigation, whether by a direct injunction against infringement suits or by ordering the patentee not to collect royalties, obviously does not confiscate anything of value.

The *Hartford* opinion (323 U. S. at 415) attempted to meet this argument by stating that *Morton Salt Co.* v. *G. S. Suppiger,* 314 U. S. 488, and *B. B. Chemical Co.* v. *Ellis,* 314 U. S. 495, cited by the Government:

> * * * merely apply the doctrine that, so long as the patent owner is using his patent in violation of antitrust laws, he cannot restrain infringement of it by others. * * *

But even if it can be said that the *Morton Salt* and *B. B. Chemical* cases rest entirely on the private law doctrine of "unclean hands" rather than on the public interest in the patent system,

the same cannot be said of the subsequent *Mercoid* cases which were decided after the *Hartford* case was first briefed and argued and were not mentioned in Mr. Justice Roberts' opinion. For in the second *Mercoid* case, 320 U. S. 680, the Court unanimously (with four concurring Justices noting the *Morton Salt Co.* case as sole authority, 320 U. S. at 684), allowed the petitioner affirmative injunctive relief against the patentee, a result which could not have been reached if the unenforceability of the patent was based only on the defensive principle of unclean hands. Even if the latter were the sole basis for unenforceability, however, it would follow that if patents are unenforceable they have no value. An antitrust judgment which recognizes this to be so accordingly cannot be deemed confiscatory, or a forfeiture. Its effect is primarily to prevent the patentee from using patents which could not be legitimately enforced to harrass potential users with the threat of expensive litigation which would often in itself be sufficient to compel them to pay tribute which could not be lawfully exacted.[37]

---

[37] *United States* v. *Vehicular Parking, Ltd.*, 54 F. Supp. 828 (D. Del.); *Lynch* v. *Magnavox Co.*, 94 F. 2d 883 (C. C. A. 9); *Patterson* v. *United States*, 222 Fed. 599 (C. C. A. 6), certiorari denied, 238 U. S. 635; *A. B. Farquhar Co.* v. *National Harrow Co.*, 102 Fed. 714 (C. C. A. 3); Vaughan, *Economics of our Patent System*, pp. 147–152; Hamilton, Temporary National Economic Committee, Monograph 31, pp. 47–48, 89; Temporary National Economic Committee, Hearings, 537, 538, 585–6, 589, 590, 600, 613–14, 631, 790.

The *Hartford* opinion relies upon the failure of Congress to enact bills which would have enabled the courts "to cancel a patent which has been used as an instrument to violate antitrust laws" (323 U. S. at 416), or compelled "a patentee found guilty of violation of the antitrust laws * * * to a penalty, to license all his future inventions at reasonable royalties" (*id.* at 417).[38] But it does not follow that the failure of Congress to adopt such legislation shows that Congress meant to prevent equity courts from exercising their established powers to give adequate relief particularly where such relief follows principles already developed in patent cases. The most that can be said is that Congress has not found occasion to single out this type of legislation from the many other bills introduced and make it a special order of business for its determination. In these circumstances the recent

[38] Although the Court relied upon these proposed bills in setting aside the royalty-free provisions of the District Court's decree, the Court apparently disregarded these bills by directing reasonable royalty licensing of defendants' existing and future patents. This result was all that some of the bills referred to in the Court's opinion sought to accomplish. Furthermore the fact that the majority opinion in the *Hartford-Empire* case ordered compulsory licensing at reasonable royalties for present and future patents and enjoined suits for past infringements, also indicates that the Court did not consider that relief in antitrust cases was limited by any overriding or clear-cut necessity for preserving improperly used patent grants.

warning by Justice Rutledge in *Cleveland* v. *United States*, decided Nov 18, 1946, Nos. 12–19, this Term, is pertinent. He said:

> Notwithstanding recent tendency, the idea cannot always be accepted that Congress, by remaining silent and taking no affirmative action in repudiation, gives approval to judicial misconstruction of its enactments. See *Girouard* v. *United States*, 328 U. S. —. It is perhaps too late now to deny that, legislatively speaking as in ordinary life, silence in some instances may give consent.[1] But it would be going even farther beyond reason and common experience to maintain, as there are signs we may be by way of doing, that in legislation any more than in other affairs silence or nonaction always is acquiescence equivalent to action.
>
> There are vast differences between legislating by doing nothing and legislating by positive enactment, both in the processes by which the will of Congress is derived and stated[2] and in the clarity

[1] As an original matter, in view of the specific and constitutional procedures required for the enactment of legislation, it would seem hardly justifiable to treat as having legislative effect any action or nonaction not taken in accordance with the prescribed procedures.

[2] See note 4. Legislative intent derived from nonaction or "silence" lacks all the supporting evidences of legislation enacted pursuant to prescribed pro-

and certainty of the expression of its will." * * *

* * * Just as dubious legislative history is at times much overridden, so also is silence or inaction often mistaken for legislation.

Furthermore, the patent cases discussed, *supra*, pp. 78–79, and particularly the *Mercoid* cases are inconsistent with the notion that the failure of Congress to pass such bills precludes the courts from holding illegally used patents unenforceable, for that is precisely what the courts have done in the cases cited.

If, when necessary to afford effective relief in private antitrust suits, such as in the *Mercoid* cases, the courts may so decree, it is not likely that Congress intended the courts to have less power in antitrust actions instituted by the Government, see pp. 95–96, *supra*. Clearly, Section 4 of the Sherman Act (15 U. S. C. Sec. 4), which empowers the courts to prevent violations at the suit of the United States, is at least as broad as Section 16 of the Clayton Act (15 U. S. C. Sec. 26), which authorizes private persons to obtain

---

cedures, including reduction of bills to writing, committee reports, debates, and reduction to final written form, as well as voting records and executive approval. Necessarily also the intent must be derived by a form of negative inference, a process lending itself to much guesswork.

[a] See note 5.

injunctive relief in accordance with general principles of equity.[39]

b. *Equity has power to grant effective relief even though the result may be to impair property values*

Even if it be assumed, *arguendo*, that application of the unenforceability doctrine would deprive the patentee of presently existing values, it does not follow that such an order would be improper. In undoing the consequences of unlawful conduct, equity frequently may cause pecuniary injury to a defendant even though it has neither the power nor the desire to punish or to forfeit property. In such cases, equity courts

[39] The pertinent provisions of Sec. 4 of the Sherman Act read as follows: "The several district courts of the United States are hereby invested with jurisdiction to prevent and restrain violations of this act; and it shall be the duty of the several district attorneys of the United States, in their respective districts, under the direction of the Attorney-General, to institute proceedings in equity to prevent and restrain such violations."

The pertinent provision of Section 16 of the Clayton Act reads as follows: "Any person, firm, corporation, or association shall be entitled to sue for and have injunctive relief, in any court of the United States having jurisdiction over the parties, against threatened loss or damage by a violation of the antitrust laws, including sections two, three, seven and eight of this Act, when and under the same conditions and principles as injunctive relief against threatened conduct that will cause loss or damage is granted by courts of equity, under the rules governing such proceedings * * *."

do not first determine whether property rights will be affected or destroyed and if so hold themselves powerless to provide a remedy having such an effect, no matter how necessary to the undoing of the wrong, although they will, of course, endeavor to sacrifice property values as litfle as is compatible with the granting of adequate relief. They first decide what relief is essential, and any harmful but necessary effect on the property rights of the wrong-doer is *absque injuria*.

The *Hartford* opinion adopts the former approach. Instead of stating merely that a court of equity may not enter an order for the purpose of penalizing or confiscating, the opinion indicates (p. 414) that since the royalty free provisions of the order confiscate property they necessarily "go beyond what is required to dissolve the combination and prevent future combinations of like character". This is a non sequitur. It puts the cart before the horse. The effect on property rights cannot determine whether such an order is in practice necessary to undo the effect of the conspiracy. The reasoning of the Court can be warranted only if there is a rule barring courts of equity from destroying property rights even when necessary to the granting of effective relief. The contrary, however, is clearly the case, as we will show.

It is well known that equity has power to abate a nuisance even though the effect may be to destroy property values, e. g., *Georgia* v. *Tennessee Copper Co.*, 206 U. S. 230, 237 U. S. 474; *American Smelting Co.* v. *Godfrey*, 158 Fed. 225 (C. C. A. 8); *United States* v. *Luce*, 141 Fed. 385 (C. C. D. Del.). A more direct deprivation of property, when necessary to do equity by restoring the *status quo* before the violation of law, occurs when money must be paid out, as for purposes of restitution. The forced payment of money is certainly the taking of the defendant's property. In *Porter* v. *Warner Holding Co.*, No. 793, 1945 Term, decided June 3, 1946, the Court upheld an order of monetary restitution in an injunction suit brought under the Emergency Price Control Act. In its opinion the Court stated with respect to the power of a court of equity:

> * * * Unless otherwise provided by statute, all the inherent equitable powers of the District Court are available for the proper and complete exercise of that jurisdiction. And since the public interest is involved in a proceeding of this nature, those equitable powers assume an even broader and more flexible character than when only a private controversy is at stake. *Virginian Ry. Co.* v. *System Federation*, 300 U. S. 515, 552. Power is thereby resident in the District Court, in exercising this

jurisdiction, "to do equity and to mould each decree to the necessities of the particular case." * * *

More closely akin to a patent is such intangible property as a contract right. That such a right may be abrogated when it stands in the way of effective antitrust relief needs no citation of authority.[40]

And if we turn to cases under the antitrust laws, it is clear that defendants have no right to escape compliance with a decree of divestiture, when that is necessary to restore competition, on the ground that available purchasers will not pay the full value of the property to be divested. Thus in *United States* v. *Union Pacific R. R. Co.*, 226 U. S. 61, 98, the Court ordered the stock in the Southern Pacific owned by the Union Pacific to be disposed of by "receivership and sale" if no satisfactory plan were presented in three months, without making its order conditional upon the bidders at the sale offering a price which would secure the defendants against property loss. The basic principle that loss of property value is to be avoided only to the extent that such a result

[40] The right to a trade-mark is also analogous to a patent right, and yet courts administering the Federal Trade Commission Act enjoin the use of deceptive trade names irrespective of whether the respondent has registered the name as a trade-mark and of the value which such a mark might have. See *Charles of the Ritz Distributors Corp.* v. *Federal Trade Commission*, 143 F. 2d 676, 679 (C. C. A. 2) and cases cited.

will not impair full effectuation of the object of the statute was stated when the *Union Pacific* case returned to this Court for instructions as to whether a proportional distribution of the Southern Pacific shares to Union Pacific stockholders were sufficient. In holding that it was not, the Court stated (226 U. S. 470, 477):

> So far as is consistent with this purpose a court of equity dealing with such combinations should conserve the property interests involved, but never in such wise as to sacrifice the object and purpose of the statute.

The same principle was applied in *Continental Insurance Co.* v. *United States*, 259 U. S. 156, a proceeding brought by Reading Co. bondholders who had not themselves violated the Antitrust Act. In sanctioning redistribution of the property secured to the bondholders by mortgage, this Court clearly indicated its desire to disturb their property rights no "more than seems necessary to effect fully the purpose of the law" (259 U. S. at 173), saying (at 171, 173):

> The power of the court under the Sherman Anti-Trust Law to disregard the letter and legal effect of the bonds and general mortgage under the circumstances of this case, in order to achieve the purpose of the law, we can not question. * * *
>
> We have no desire to vary the security of the bondholders more than seems neces-

> sary to effect fully the purpose of the law, and wish to recognize their equities as against the two companies and the stockholders, as will later appear.

In a similar case decided the same day, the Court stated (*United States* v. *Southern Pacific Co.*, 259 U. S. 214, 241):

> We direct that a decree be entered severing the control by the Southern Pacific of the Central Pacific by stock ownership or by lease. But, in accomplishing this purpose, *so far as compatible therewith*, the mortgage lien asserted in the brief filed for the Central Union Trust Company shall be protected. [Italics supplied.]

These cases clearly demonstrate that in fashioning antitrust relief the courts should attempt to impair property value as little as is "compatible" with the accomplishment of the purpose of the antitrust law—not that they should refuse to give effective relief because property rights may be injured.

That this is the proper approach was recently reaffirmed in *United States* v. *Crescent Amusement Co.*, 323 U. S. 173, decided shortly before the Hartford-Empire case. The defendants there contended that the divestiture provisions of the decree (323 U. S. at 189):

> * * * are inequitable and harsh income tax wise, that they exceed any reasonable

requirement for the prevention of future violations, and that they are therefore punitive.

In reply, the Court stated (*ibid.*):

> The Court has quite consistently recognized in this type of Sherman Act case that the government should not be confined to an injunction against further violations. Dissolution of the combination will be ordered where the creation of the combination is itself the violation. * * * Those who violate the Act may not reap the benefits of their violations and avoid an undoing of their unlawful project on the plea of hardship or inconvenience. That principle is adequate here to justify divestiture of all interest in some of the affiliates since their acquisition was part of the fruits of the conspiracy. But the relief need not, and under these facts should not, be so restricted. The fact that the companies were affiliated induced joint action and agreement. Common control was one of the instruments in bringing about unity of purpose and unity of action and in making the conspiracy effective. If that affiliation continues, there will be tempting opportunity for these exhibitors to continue to act in combination against the independents. The proclivity in the past to use that affiliation for an unlawful end warrants effective assurance that no such opportunity will be available in the future. * * *

c. Where the lawful portion of the value of defendants' patents cannot be segregated from the value resulting from the unlawful combination, defendants are entitled to no return on the patents.

The provision that the defendants may not enforce their patents has another justification not considered in the *Hartford* case. Only the unlawful combination prevented competition between the Barton-Rossi, Jebsen, and Blumenfeld patents. The joiner of all the patents to create and maintain a patent position for exclusive use by the defendants is what has given the defendants their present advantage. If there had been competition between the three original patent developments, there would have been and would still be an incentive to keep the royalties low otherwise lacking. Under the present decree the District Court is to attempt to fix reasonable royalties. But a substantial proportion of the value of the defendants' patents at present exists only because of the prior lack of competition between the different lines of technological development.

If it were possible to segregate whatever value the patents now possess into the portion derived solely from the lawful patent right and not from the unlawful use the district court might proceed to establish royalty for the former alone.[11]

[11] As to the difficulty of this see pp. 63–78, *supra*.

But defendants' unlawful conduct during over two decades has so established the structure of the industry that any such segregation is now utterly impossible. We do not believe that it can now be said with any certainty that any particular proportion of the patent values does not stem from the unlawful manner in which the patents have been used.

Inasmuch as this inability to determine the portion of the values attributable to the lawful patent right has resulted from the defendant's own misconduct, they must bear the burden of it. As this Court recently stated in dealing with an analogous problem in *Bigelow* v. *RKO Radio Pictures*, 327 U. S. 251, 265:

> The most elementary conceptions of justice and public policy require that the wrongdoer shall bear the risk of the uncertainty which his own wrong has created. See *Package Closure Corp.* v. *Sealright Co.*, 141 F. 2d 972, 979. That principle is an ancient one, *Armory* v. *Delamirie*, 1 Strange 505, and is not restricted to proof of damage in antitrust suits, although their character is such as frequently to call for it application. * * * And in cases where a wrongdoer has incorporated the subject of a plaintiff's patent or trade-mark in a single product to which the defendant has contributed other elements of value or utility, and has derived profits from the sale of the product, this

Court has sustained recovery of the full amount of defendant's profits where his own wrongful action has made it impossible for the plaintiff to show in what proportions he and the defendant have contributed to the profits. *Westinghouse Co.* v. *Wagner Mfg. Co.*, 225 U. S. 604; *Hamilton Shoe Co.* v. *Wolf Brothers*, 240 U. S. 251; see also *Sheldon* v. *Metro-Goldwyn Corp.*, 309 U. S. 390, 406.

The illustration last quoted is the converse of the situation here. Where the wrongdoer has by his own conduct prevented severance of the wrongful and lawful portions of the value of a patent, he should be entitled to nothing. This result is reached not for purposes of punishment, but to restrain defendant from further profiting from his wrong at the expense of the victims of the crime.

A similar principle proclaimed in a number of antitrust cases permits the cancellation of valid as well as of invalid segments of an unlawfully established system "in order that the ground may be cleansed effectually from the vice of the former illegality. Equity has power to eradicate the evils of a condemned scheme by prohibition of the use of admittedly valid parts of an invalid whole". *United States* v. *Bausch & Lomb Co.*, 321 U. S. 707, 724. Similarly in dealing with a scheme containing an intermingling of lawful and unlawful provisions, the Court stated in

United States v. *Univis Lens Co.*, 316 U. S. 241, 254:

> But if we assume that such restrictions might otherwise be valid, cf. *Fashion Guild* v. *Trade Commission*, 312 U. S. 457, 467, these features are so interwoven with and identified with the price restrictions which are the core of the licensing system that the case is an appropriate one for the suppression of the entire licensing scheme even though some of its features, independently established, might have been used for lawful purposes. *Ethyl Gasoline Corp.* v. *United States, supra*, 461. * * *

d. *The duration of the injunction against enforcement*

In the Government's original assignment of errors it was urged that the District Court erred by not making defendants' patents royalty free until the consequences of the defendants' misconduct should have been dissipated (R. 330). The Government has moved to amend this assignment so as to enjoin the enforcement of defendants titanium patents for the remainder of their lives. As appears from the motion to amend, the latter relief was well within the limit of the relief requested from the court below.

For the reasons set forth herein we believe that defendants are not entitled to any royalties on the patents they have misused. If the Court

is unwilling to accept this contention or to permit the amendment of the assignment of errors, the Government requests in the alternative that the defendants be enjoined from enforcing their patents or collecting royalties thereon until they show that the effect of their wrongdoing has been fully dissipated and a truly competitive industry restored.

Our reasons for urging that the public interest requires that defendants' patents be rendered unenforceable for the remainder of their lives may be briefly summarized as follows:

(1) The unlawful use of the patents here involved, the combination which prevented competition in licensing and inventing, was in large part, to an undefinable extent, responsible for defendants securing royalties on the patents. The combination left the two defendants in a dominant position over the industry. To require others to pay the defendants royalties, would, as has been shown *supra* pp. 54–63, preserve the defendants' advantage and thereby prevent neutralization of their unlawful conduct and the establishment of effective competition. Thus the consequences of the unlawful conduct can never be dissipated while royalties continue to be paid.

(2) As a practical matter, newcomers would be discouraged from entering the industry if there was a possibility that at some future time

they might be forced to commence paying royalties. Potential competitors would doubtless recognize that when this occurred royalty payments would give the defendants an advantage over them at least in the amount of the royalties. Since many of the chemicals produced are standardized products, even a small difference in production costs would render it difficult for a newcomer to compete. The mere possibility that royalties might have to be paid at some unknown future time would therefore in itself prevent the investment of capital in new enterprises in the field. The seemingly reasonable restriction on the period of the royalty free licensing would thus completely block the establishment of an industry in which others might compete with the defendants.

(3) The same reasons which have led to the unenforceability of the patent privilege under the patent laws where the privilege has been used so as to create, or to threaten the creation of, a monopoly beyond the authorized grant are *a fortiori* applicable where the extension of the privilege is the deliberate program of an illegal combination. Both the integrity of the patent system and the efficacy of the antitrust laws require termination of the patent privilege which has been abused by such a deliberate program.

II

Permitting Reciprocal Licensing Increases Defendants' Domination of the Industry

The judgment of the trial court provides (R. 313) that the licenses granted by the defendants "may, at the option of the licensor, be conditioned upon the reciprocal grant of a license by the applicant, at a reasonable royalty, under any and all patents covering titanium pigments or their manufacture, now issued or pending, or issued within five years from the date of this decree, if any, owned or controlled by such applicant." The inclusion of such a provision is not required (*Hartford-Empire Co.* v. *United States*, 323 U. S. 386) and its inclusion in this case at the request of the defendants (R. 116–126, 1242) impairs the capacity of the judgment to restore competition in the industry.

The judgment is intended to "restore titanium to the system of free competition" (R. 222) by neutralizing the means by which the emergence and growth of competition has been stifled. We assume it to be conceded that this cannot be accomplished unless non-defendants have access to patents of the defendant. However, access to these patents neutralizes but one means of defendants' control. Non-defendants will still be faced with the practical competitive disadvantages inherent in competing with the long-entrenched duopoly. The present condition on access to

patents of defendants increases this disparity in the competitive positions of defendants and non-defendants. It requires each non-defendant who would use the patents of the defendants to surrender to its entrenched competitors the competitive advantage of any patent it may have or acquire. The extent of this surrender is complete. A non-defendant who wishes to use a single patent of the defendants must surrender to them licenses under every patent it now owns or acquires within five years. Moreover, the cumulative effect of these surrenders still further increases the disparity in positions since each defendant acquires licenses under all the patents of each non-defendant while each non-defendant acquires licenses only under the patents of the defendants.[42] The result is a continually enlarging pool of patents available to defendants but unavailable to every outsider. A final consequence is to remove from non-defendants one of the incentives to invent.

The considerations which induced the trial court to include this provision are suggested by its remarks at the hearing on the form of the judgment. It is inferable that the Court believed its effect would be to create a pool of patents to

[42] The defendants would not be required to grant sublicenses to other non-defendants. The judgment does not require that the defendants be granted power to sublicense and, even if such power were granted, the judgment applies only to exclusive licenses acquired by the defendants (R. 310).

which every producer in the industry would have access (R. 1252). We have already shown that this would not be its effect since the patents of one non-defendant are not made available to other non-defendants. Moreover, even if such was its effect it would still be inappropriate for the reasons stated.

The district court intimated that it might also have been influenced by the fact that "conceivably" a non-defendant might become "the dominating factor in the industry under this extraordinary advantage of being able to take everything for itself and keeping everything that it has" (R. 1274). Such a result might be conceived, but we submit it is so highly improbable under the facts of this case as not to justify the inclusion of a provision which is actually in derogation of the statutory objective of the judgment. While we believe such a development impossible, we wish to point out that if such a possibility existed it would merely show how much the defendants' unlawful aggregation of patents has suppressed the growth of competition. It is the function of the judgment to restore the industry to competition irrespective of its consequences on defendants' positions. It is clearly improper to require a non-defendant to surrender lawfully acquired competitive advantages to protect the defendants' unlawfully acquired position from the effects of the competition the Act seeks to protect.

National Lead contended in requesting the inclusion of the provision that the defendants "are entitled to the same treatment from their competitors as they are required to accord to them." This contention fails to consider that these competitors were not parties to the action and have not been found guilty of violating the Sherman Act or abusing the privilege conferred upon them by a patent grant. We do not believe that a court has *power* to restrict the lawful competitive advantages of a non-defendant. Insofar as such competitive advantages may exist, they are factors which the Court may take into consideration in determining the nature and quantum of the relief against the defendants in the action. But they clearly may not be made the basis for any affirmative scheme of judicial future regulation of those advantages under the guise of an injunction against the defendants. There is, therefore, no basis for subjecting their patents to compulsory licensing to the defendants.

III

The Need To Give Outsiders Access to the Technology of the Industry

The technology of the titanium pigment industry may for present purposes be divided into two classes. The first class includes a body of information relating to its general problems. Some of these problems are among those on which

DP and NL are shown by the record to have exchanged information, *supra,* p. 33. The second class includes information directly related to the manufacture of specific products and the methods of practicing inventions embodied in expired or existing patents. The defendants and their co-conspirators have by means of the unlawful combination to which they were parties acquired and maintained as a closely guarded secret a monopoly of this technology and this monopoly is one of the sources of defendants' control over the industry, *supra,* p. 51. The judgment of the district court does not grant outsiders access to this fund of accumulated knowledge. The judgment merely provides that for a period of three years a license granted pursuant to paragraph 7 may at the option of either party contain a provision for imparting at a reasonable charge and in writing the methods and processes used by the licensor in its commercial practice under the licensed patents in connection with the production of titanium pigments (R. 314). Its effect is to continue the exclusion of outsiders from the general technology of the industry and place outsiders under a competitive disadvantage as a result of lack of information on the solution of the general problems of the industry. Its further effect is to exclude outsiders from the technology relating to the production of products within the ambit of the restraints of the industry, as defined by the

definition of "licensed field" in the various agreements, which are neither patented nor produced by a patented process or apparatus (RE. 1452). It also excludes outsiders from the technology relating to the practice of the inventions embodied in expired patents including the basic patents upon which the industry is based. And finally its effect is to exclude outsiders from the technology relating to the practice of any patented invention which the defendants have not put into commercial use.

If defendants' control over the industry is to be neutralized and outsiders are to be given an opportunity to compete within any reasonable time in all the products included in the trade and commerce restrained, these outsiders must be given access to the entire technology of the industry. But in any event the information to which they should be granted access should not be narrower in scope than that provided for in the agreements between DP and NL. The requirement that the licensee pay a reasonable charge for the information will, as a practical matter, tend to limit to the irreducible minimum the information which the defendants will be required to impart to outsiders.

The present provision of the judgment insofar as it requires the imparting of information relating to the inventions embodied in the license patents is not unlike those frequently contained

in the normal patent license. The provision may be adequate in such cases because of the difference in the problem presented in the usual case of a patent license. The basic technology of the industry is known or available, hence all that is needed is the technology relating to the licensed patent. The situation here stands on a different footing. The basic technology of the industry is a closely guarded secret of the conspirators and a means by which the unlawful control of the industry has been achieved. The object of the provision is to neutralize this control and assist in opening the industry to outsiders. Any argument that the present provision is adequate misconceives its purpose to be merely to permit the outsiders to practice the inventions contained in the licensed patents.

We recognize that this Court in the *Hartford-Empire* case, 323 U. S. at 418, without stating any reason, deleted paragraph 24 (c) of the decree of the district court which required the petitioners to furnish at cost-plus a reasonable profit all drawings and patterns relating to the machinery or methods and in the manufacture of glassware embodied in the licensed inventions. Section 24 (c) seems to have been treated as an integral portion of Section 24 (a), which was concerned with royalty-free licensing. For the reasons heretofore indicated in this brief, we believe that even on that assumption such a provision would

have been proper. But in this case the need for giving the entire industry access to the defendants' technology justifies a provision to that effect in the decree irrespective of whether the patents are made unenforceable. The defendants' monopoly of the technology was an independent means of control of which they must be divested if true competition in the industry is to be restored. It should be noted that the defendants will receive a reasonable compensation for furnishing the technology, so that the inclusion in the judgment of the relief demanded by the Government in this respect is not at all inconsistent with the holding in the *Hartford* case with respect to royalty-free patents.

IV

The Need for Partial Divestiture of Plants

National Lead and duPont each own and operate two separate plants for the manufacture of titanium pigments. The plants of National Lead are located at St. Louis, Missouri, and Sayreville, New Jersey; those of duPont at Baltimore, Maryland, and Edge Moor, Delaware (R. 1153, 874, Govt. Ex. 3).[42] It is the Government's contention that effective relief requires each of the defendants to transfer one of its plants to a new corporation whose stock should be sold to

[42] By stipulation between the parties Exhibit 3 was not reproduced but is a part of the record for all purposes (R. 360).

and owned by others than the defendants or their co-conspirators.

The district court found that the defendants acquired domination and control of the industry as a result of the unlawful agreements. They produce 100 per cent of the composite and 90 per cent of the pure titanium pigments produced in the United States. They possess the competitive advantage of size, capacity, assured source of ilmenite, the cumulated experience and technology of the major producers here and abroad, extensive research facilities, trained personnel, established trade connections and good will, and probably much lower production costs than those who do or would compete with them. *Supra*, p. 56.

These competitive advantages give them the power to suppress the competition of others. An industry so constituted with its dominant members so armed is not attractive to the huge capital necessary to enter it. And those who are already in the industry or may later enter it are faced with such serious competitive handicaps that their substantial growth is problematical. The position of competitors in this regard is not unlike that which prompted the court to say in *United States* v. *Aluminum Company of America*, 148 F. 2d 416, 431 (C. C. A. 2):

> It [the defendant Aluminum Company] insists that it never excluded competitors; but we can think of no more effective

> exclusion than progressively to embrace each new opportunity as it opened, and to face every newcomer with new capacity already geared into a great organization, having the advantage of experience, trade connections and the elite of personnel.

The above language was quoted and "endorsed" in *American Tobacco Co. v. United States*, decided June 10, 1946, Nos. 18–20, last Term.

Reality requires the assumption that defendants will utilize to the fullest every advantage they possess. Unquestionably they will adopt policies designed to prevent outsiders from capturing any portion of the market the defendants have so long regarded as their own.

Since the emergence of any, or at least substantial, competition within any foreseeable period is unlikely, the existing industrial pattern will probably continue; and with it the existing marketing pattern in which purchasers are denied the benefits of true competition. Economic studies have demonstrated that when two great corporations completely dominate an industry there is no incentive for the two corporations to compete with each other, quite apart from the presence or absence of collusive agreements between them.[*] Duopoly, the control of an

---

[*] Wilcox, *Competition and Monopoly in American Industry*, Temporary National Economic Committee Monograph No. 21, 76th Cong., 3d Sess. (1940), pp. 9–10, 98–112; Chamberlin, *The Theory of Monopolistic Competition*, 1935, Ch. III.

industry by two giant corporations where each has the power to weigh acceptance of a share in a stable market against the rigors of price competition inevitably has the same basic characteristics and the same ultimate effects as monopolization of an industry by a single corporation. In this case the duopoly has demonstrated the characteristics and effects of monopoly. Price uniformity resulted from the duopoly even though the lower court found no evidence of express agreement on prices. Without divestiture the private interests of the duopolists continue to be set against the public interest because the hazard of competition is too great and the premium of "price stability" becomes a necessity in the eyes of the management. It ignores the realities inherent in the concentration of economic power possessed by these two defendants, to say that competition in the titanium industry can be restored merely by the application of injunctive relief against future conduct. The course of conduct of the two defendants over a period of years is too long engrained in the business attitudes of the management of the two corporations to be rectified by enjoining certain restrictive practices. The titanium industry is only an isolated instance of the dangerous trend toward concentration of economic power in the hands of a few industrial giants.[45]

[45] *Economic Concentration in World War II*, Report of the Smaller War Plants Corp. to the Special Committee to Study Problems of American Small Business, 79th Cong., 2d Sess. 1946.

This trend cannot be curtailed unless duopolies adjudged to have violated the Sherman Act are divested of sufficient part of their assets to establish new competing units in the industry.

Thus there now exists in each of the defendants a power which in and of itself operates to continue substantially to deprive competitors and the public of the benefits of the Sherman Act. Since this continually operating and expanding force cannot be neutralized or otherwise controlled by enjoining future conduct we contend that establishment of new competing units out of the old noncompeting duopoly is the only appropriate remedy.

The court has sanctioned partial divestiture to neutralize power restrictive of competition. Thus partial divestiture has been approved when the court found a fused combination unlawful because of the power created by the fusion. The classic examples of this type of case are *Standard Oil Co.* v. *United States*, 221 U. S. 1, and *United States* v. *American Tobacco Co.*, 221 U. S. 106. We believe these cases establish a general principle that such relief is appropriate whenever a power exists which must be neutralized and cannot be neutralized by injunctive relief. It is true that divestiture in these cases was applied to the domination of the industry by a single corporation. But it certainly cannot be seriously urged that the Sherman Act is applicable only to domination by a single person or corporation. *Ameri-*

can Tobacco Co. v. United States, decided June 10, 1946, Nos. 16–20, 1945 Term. If it is true that two corporations can unlawfully monopolize, then certainly the power of the courts to create competing units by partial divestiture of the two would exist no less than in the case of a single monopolist. The real question here is not the power of the court to divest, but the necessity of divestiture to secure adequate relief in this particular case. That the courts have also recognized that adequate competition cannot be secured in a duopoly situation, much less with a duopoly characterized by an entire history of complete absence of competition, is evidenced from the fact that in every divestiture or dissolution suit in the past, the creation of more than two competing units was required.[46]

Defendants' position that partial divestiture is appropriate only when power has been acquired by acquisitions or fusions of competitors fails to consider that the purpose of such relief is to neutralize a power and not to undo acquisitions

[46] In *United States v. Standard Oil Co.*, 173 Fed. 177 (C. C. E. D. Mo.) there were approximately 40 units in the various branches of the industry. The smallest number of units in any one field was 5, i. e., production. See Commissioner of Corporations, I Report on Petroleum Industry (1907), 85 *et seq.*; in *United States v. American Tobacco Co.*, 164 Fed. 700, 164 Fed. 1024 (C. C. S. D. N. Y.), there were 14 units of which 3 were full line; in *United States v. E. I. Du Pont de Nemours & Co.*, 188 Fed. 127 (C. C. Del.), there were 3 units; in *United States v. Corn Products Refining Co.*, 234 Fed. 964 (S. D. N. Y.) 4 plants.

and fusions." The excerpt, quoted *supra*, p. 47, from the opinion in the *Standard Oil* case, makes this clear. Moreover, it has been held that a company which acquired monopoly power merely by expanding its facilities to meet the growing demands of an industry is not invulnerable to partial divestiture. *United States* v. *Aluminum Company, supra.* Certainly when such expansion is promoted by the use of unlawful devices the power so acquired may be neutralized by partial divestiture.

The position that partial divestiture is appropriate only in cases of illegal acquisitions or fused combinations means that a court could not grant effective relief. It would mean in this case, for example, that Virginia Chemical and Zirconium, whose growth was unlawfully stifled by the defendants, must now attempt to expand and acquire the position of which they were deprived without the benefits of a rapidly enlarging demand and by a competitive struggle in which their competitors, the defendants, are powerfully armed with the fruit of their wrong-doing.

Since the defendants possess this power, it would seem immaterial, when the issue is one of

---

"The development of titanium as a pigment threatened established interests of duPont and National Lead in white lead and lithopone. Both duPont and National Lead, respectively, made their entry into the titanium field by acquiring control over other manufacturers of pigments interested in the then developing titanium field. (R. 238, 246.) Historically, at least, the fusion of potentially competitive units occurred in the development of the present titanium duopoly.

relief as distinguished from the issue of whether there has been a violation of the act, whether the power was lawfully or unlawfully acquired. However, it is clear that in this case the defendants did unlawfully acquire their power. Since its inception, the domestic industry has been protected from the competition of foreign-made products by the agreements of foreign producers not to export to or compete within the United States; from the competition of goods produced in the United States under patents owned by foreigners by virtue of the agreements of the foreigners to make those patents available only to the defendants; and from the competition of Virginia Chemical and Zirconium by the limitations on their production. Moreover, a purpose of the DP and NL agreement was their mutual desire to strengthen their position *vis-a-vis* outsiders. This desire was accomplished by the agreement which also produced a proliferation of patents. The combined result was an effective patent barrier to new competition. Clearly, since the agreements contained provisions calculated to accomplish that purpose, defendants cannot say, when the purpose has been accomplished, that the accomplishment was not the result of the unlawful agreements either as a matter of law or of fact. The situation thus is one in which the defendants unlawfully freed of competition from others, have together been able to preempt a growing market and to create facilities and organizations capable of handling the ever expanding demand.

As stated by the District Court in the *Hartford-Empire* case (46 F. Supp. 541, 618 (N. D. Ohio), prior to this Court's decision:

> Men cannot, by illegal means, erect an illegal structure—a structure of dominance and control over an industry vital to the welfare of the public—and then, by destroying the illegal means by which the structure has been erected, take the position that they have reformed, that they have adopted a new course of conduct, and that they should go on their way unmolested by the law—as long as the illegal structure and its adverse effects upon the public remain.

Even if it be assumed that other relief granted against them would make du Pont and National Lead fully competitive, as against each other, the competition envisioned by the Sherman Act would not have been restored to this industry. The spectacle of any two companies, which dwarf all existing competitive units in the scale of their operations and control of physical assets, engaging in a competitive struggle with each other so severe as to reduce substantially their own position with respect to the rest of the industry is not one which has been observed in recent years. But two such companies with a record of Sherman Act violation are certainly not going to suffer a change in their basic economic attitudes sufficient to make such conduct probable, or even possible, by the entry of a decree which does no more than enjoin particular restrictive practices. Thus, the only way in which substantial units with the power and desire to compete

actively in such an indusfry may be created is by the transfer of substantial assets of the dominant violators into clean hands.

The choice presented by the Government's appeal is between regulation and elimination of monopoly power. If, as the *Tobacco* case [48] suggests, the Sherman Act is primarily concerned with the possession of monopoly power by those who have demonstrated an intention to abuse it, destruction of such power by judicial decree should follow a finding of illegal acquisition or abuse as a matter of course. Where Congress has intended to recognize the continued existence of such power it has established an appropriate administrative agency to regulate it and has conspicuously refrained from committing to courts the kind of regulatory task implicit in the decree entered below.

The district court's ~~failure to assume~~ assumption of that task was apparently dictated by a doubt that this Court would sanction a decree which actually destroyed the power of the defendants to dominate the industry here involved. We think the *Tobacco* case has resolved any doubt that monopoly power itself rather than its mere exercise is the principal target of a Sherman Act suit. This Court's action in the *Crescent* [49] and *Schine* [50]

[48] *American Tobacco Co.* v. *United States*, Nos. 18, 19, 20, 1945 Term, decided June 10, 1946.

[49] *United States* v. *Crescent Amusement Co.*, 323 U. S. 173.

[50] *United States* v. *Schine Chain Theatres*, 63 F. Supp. 229,

cases also appears to answer any doubt that a Sherman Act decree should effectively divest the defendant of monopoly power, rather than rely upon any scheme for judicially regulating such power.

The *Crescent* case sanctioned a divestiture of stock in non-defendant corporations the acquisition of which was not itself unlawful, recognizing that possession of such stock in the hands of defendants who had abused the power so acquired was itself a continuing threat to independent competitors. In the *Schine* case the district court ordered a divestiture of theatres in towns where there was no evidence of elimination of existing competitors as a means of creating competition for the defendants. That court recognized that the possession of certain physical assets not independently used in connection with any specific law violation was also a continuing threat to independent competition. In both cases divestiture of assets was held to be a proper and necessary means of eliminating this threat, notwithstanding the presence in both decrees of injunctive provisions expressly prohibiting the particular forms of unlawful conduct upon which the convictions of Sherman Act violation rested.

While it is true that in these cases this Court merely affirmed the exercise of an admittedly

(D. C. W. D. N. Y., 1945), appeal dismissed, No. 572, this Term, December 16, 1946, petition for rehearing filed, January 9, 1947.

wide discretion by district courts, we do not believe that their discretion embraces a choice between at least partial divestiture of monopoly power and future judicial regulation of such power in the hands of defendants guilty of its unlawful acquisition or use. Certainly the degree of divestiture required to remove the threat implicit in the continued possession of such power by such defendants may largely rest with the discretion of the trial court, but neither Congress nor this Court has so far told the district courts that they may establish or administer a regulatory scheme of control as a substitute for the divestiture relief customarily required to eliminate such power.

The inquiry as to the propriety of the divestiture relief sought here is actually an inquiry into the source of the power by which these defendants now control the monopoly percentages of the titanium pigment market which they were found jointly to possess. Whether any particular plant or other physical asset of either defendant is a direct or indirect product of the particular unlawful means by which the over-all monopoly position was achieved is obviously irrelevant to this problem. If as seems clear from the evidence their overwhelming control of plant capacity itself promises to permit continued dominance of the industry by them no relief is adequate which does

not transfer a substantial part of that capacity to a competitor with clean hands.

Where two or more industrial units have jointly gained such dominance by illegal means they should not be permitted to retain physical facilities which allow continued dominance by lawful methods. Otherwise this Court's assumption in the *Tobacco* case that the Act is aimed ultimately at removal of monopoly power from the hands of Sherman Act violators, even when jointly possessed by two or more, becomes meaningless when applied to equity suits. We respectfully submit that this Court should insist that this assumption be made effective in civil suits by directing relief which attacks monopoly power at its source. We submit further that this Court should also disavow the involved systems of attempted judicial regulation of such power resulting from mistaken efforts to avoid the admittedly drastic consequences of a direct attack. The district courts are by their nature and experience equipped to reorganize corporate assets and enforce unequivocal prohibitions of specific future conduct. They do not have the technique or personnel required to administer competition in any industry and the consequences of their assumption of such a burden may well be more drastic in their effect on the whole economy than the simpler and sterner measures embodied in traditional antitrust relief.

CONCLUSION

For the above reasons it is respectfully submitted that the judgment of the court below should be modified so as (1) to enjoin the enforceability of the defendants' patents herein involved for the duration of the terms of the grants, (2) to forbid the defendants from requiring cross licenses of patents in return for licenses of the defendants' patents, (3) to require the defendants to furnish to any applicant the technological information of defendants at a reasonable charge, (4) to require each defendant to divest itself of one of its titanium plants, and in such other and further respects as may be necessary or appropriate to carry out the foregoing modifications.

Respectfully submitted.

Statement as to Abbreviations Used in Brief

On the trial, in the District Court's opinion and findings, and in the judgment, the many companies involved were referred to by initial letters or by abbreviated names. These initials and abbreviations are frequently used in this brief. For convenience they are listed below, as follows:

NL or National	— National Lead Company
DP or du Pont	— E. I. du Pont de Nemours and Company
Tinc or Titan	— Titan Company, Inc.
TP or Pigment	— The Titanium Pigment Company, Inc.
Krebs	— Krebs Pigment & Color Corporation
TAS or Titan A/S	— Titan Co. A/S
IG or I. G. Farben	— Interessengemeinschaft Farbenindustrie Aktiengesellschaft
TG or Titangesellschaft	— Titangesellschaft m.b.H.
SIT or Société Industrielle	— Société Industrielle du Titane
ICI	— Imperial Chemical Industries, Ltd.
GW or Goodlass Wall	— Goodlass Wall and Lead Industries, Ltd.
ISC	— Imperial Smelting Corporation, Ltd.
BTP or British Titan	— British Titan Products Company, Ltd.
NTP or Laporte	— National Titanium Pigments, Ltd.
CIL	— Canadian Industries, Ltd.
CTP	— Canadian Titanium Pigments, Ltd.
KK or Kokusan	— Kokusan Kogyo Kabushiki Kaisha
TK	— Titan Kogyo Kabushiki Kaisha
Terres Rares	— Société des Produits Chimiques des Terres Rares
Thann	— Fabriques des Produits Chimiques de Thann et de Mulhouse
Montecatini	— Societa Anonima Titanium
Aussig	— Vereins fur Chemische und Metallurgische Produktion

TINC, IG, TG, ICI, ISC, GW, BTP, CIL, CTP, KK, and TK are sometimes collectively referred to as the Titan Companies and, with National and du Pont, as the Allied Companies.

Aussig, Montecatini, Terres Rares, Thann, and Laporte are sometimes collectively referred to as the Blumenfeld Companies.

APPEALS FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE SOUTHERN DISTRICT OF NEW YORK

BRIEF FOR NATIONAL LEAD COMPANY AND TITAN COMPANY, INC.

Opinion and Judgment Below

The opinion and judgment of the District Court are reported in 63 F. Supp. 513 (1945). They are printed at R. 185 and 308, respectively.

Jurisdiction

The judgment of the District Court was entered October 11, 1945 (R. 307). The petitions for appeal were filed in and

granted by the District Court December 10, 1945 (R. 329, 336). Probable jurisdiction was noted by this Court May 20, 1946 (R. 334). This Court has jurisdiction by virtue of Section 2 of the Expediting Act of February 11, 1903 as amended (32 Stat. 823, 36 Stat. 1167, 15 U. S. C. § 29). and Section 238 of the Judicial Code as amended (36 Stat. 1157, 38 Stat. 804, 43 Stat. 938, 28 U. S. C. § 345).

Statement of the Case

A. The Complaint

It is alleged (R. 10) that National Lead Company, Titan Company, Inc., and E. I. du Pont de Nemours and Company combined and conspired to restrain and to monopolize trade and commerce in titanium compounds among the several states of the United States and with foreign nations and have been parties to contracts, agreements, and understandings in restraint of such trade and commerce in violation of Sections 1 and 2 of the Sherman Act.* It is charged (R. 11-12) that the combination and conspiracy has consisted of a continuing agreement and concert of action

*SECTION 1. Every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations, is hereby declared to be illegal: . . . Every person who shall make any contract or engage in any combination or conspiracy hereby declared to be illegal shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding $5,000, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

SECTION 2. Every person who shall monopolize, or attempt to monopolize, or combine or conspire with any other person or persons, to monopolize any part of the trade or commerce among the several States, or with foreign nations, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court. 26 Stat. 209 (1890), as amended 50 Stat. 693 (1937), 15 U. S. C. §§ 1, 2 (1940).

among the defendants and co-conspirators, the terms of which have been that

(*a*) The United States market was to be allocated to defendants National and du Pont as their exclusive territory for the manufacture and sale of titanium compounds;

(*b*) The markets of the world outside the United States were to be allocated among defendants and co-conspirators by reserving certain markets as the exclusive territory for the manufacture and sale of titanium compounds to some of them, and by fixing quotas which certain of them were to be permitted to sell in other markets;

(*c*) National and du Pont and customers purchasing from them were not to export titanium compounds from the United States except to South and Central America;

(*d*) Domestic manufacturers other than National and du Pont were to be prevented from exporting titanium compounds from the United States;

(*e*) The foreign co-conspirators and customers purchasing from them were not to import titanium compounds into the United States;

(*f*) The foreign co-conspirators were not to manufacture and sell titanium compounds in the United States;

(*g*) The foreign co-conspirators were not to license under their patents any persons, except National and du Pont, to manufacture and sell titanium compounds in the United States;

(*h*) All persons were to be prevented from engaging in the manufacture and sale of titanium compounds in the United States, except with the consent of National and du Pont;

(*i*) All present and future patents, owned or to be acquired by the defendants and the other Allied

companies, relating to the manufacture and sale of titanium compounds were to be pooled in such manner that National and du Pont would receive licenses exclusive of all others under all such United States patents, present and future, owned by the Titan companies; each Allied company would grant to each Titan company an exclusive license under all such patents, present and future, owned or to be acquired by such Allied company for use in the territory allotted to such Titan company; National would grant to du Pont a license exclusive of all others except National under all such United States patents, present and future, owned or acquired by National; and du Pont would grant to National a license exclusive of all others except du Pont under all such United States patents, present and future, owned or to be acquired by du Pont.

The Government contended (R. 39-40):

(*a*) That all the contracts to which National Lead Company or Titan Company, Inc. were parties were unlawful and that their performance should be enjoined;

(*b*) That the defendants had combined and conspired to restrain foreign and domestic trade and commerce in titanium compounds in violation of Section 1 of the Sherman Act;

(*c*) That the defendants had combined and conspired to monopolize trade and commerce in titanium pigments in violation of Section 2 of the Sherman Act;

(*d*) That the court should perpetually enjoin the defendants and their representatives from combining and conspiring or agreeing to restrain and monopolize trade and commerce among the states of the United States or with foreign nations with

respect to titanium compounds, and that they be perpetually enjoined from engaging in or participating in practices, contracts, relationships, or understandings having the purpose or effect of continuing, reviving, or renewing any of the violations of the Sherman Act;

(*e*) That the court should order the defendants to grant upon the request of any third person a royalty-free license to make, use, or sell any invention or inventions which defendants had used in carrying out the alleged illegal agreements and to furnish such third person all technical information appropriate to practice said invention.

B. The Judgment

Finding that National Lead Company, Titan Company, Inc., and E. I. du Pont de Nemours and Company had violated Section 1 of the Sherman Act and that the Government was entitled to a decree which would restore titanium to the system of free competition and destroy the means of preventing such competition (R. 222), the District Court by its judgment (R. 308-16)

1. Held the agreements to be unlawful under Section 1 of the Sherman Act, cancelled the agreements, and enjoined the defendants and any other person acting or claiming to act through or for them from the further performance of any of the provisions of the agreements.

2. Enjoined the defendants from

   (*a*) Entering into, adhering to, or claiming any rights under any contract, agreement, undertaking, plan or program among themselves, the co-conspirators or with any other person, partnership or corporation which has as its purpose renewal of any of the agreements;

(*b*) from entering into, adhering to, maintaining or furthering, directly or indirectly, any contract, agreement, undertaking, plan, or program with any other producer or dealer relating to titanium pigments which has as its purpose or effect

(*i*) to divide sales or manufacturing territories,

(*ii*) to allocate markets,

(*iii*) to limit or prevent United States imports or exports,

(*iv*) to grant any third party any market as its exclusive territory;

(*v*) to keep any third party out of any market.

(*c*) from restricting any producer of titanium pigments in the use thereof.

3. Ordered the defendants to grant any applicant a non-exclusive license on a reasonable royalty basis under any existing United States patents and any patents issued to them within a period of five years from the date of the Final Decree and, also for a period of five years, under any patent under which they become exclusive licensees with the right to grant sublicenses. Such grant may, at the option of the licensor, be conditioned upon a reciprocal grant by the applicant under any titanium patents owned by the applicant. During a period of three years from the date of the decree such license or reciprocal license may at the option of either party contain a provision for the imparting in writing, at a reasonable charge, of the methods and processes used by the licensor at the date of the license in its commercial practice and under the licensed patents in connection with the production of titanium pigments.

4. Ordered the National Lead Company and Titan Company, Inc. to present within one year from the date of the Final Decree to the court for its approval a plan for divesting themselves of their stockholdings and financial interest, direct or indirect, in certain foreign companies, or for the purchase of the entire stockholdings or other financial interests in said companies,—the plan to provide for its completion within two years from the date of the Final Decree.

5. Enjoined the defendants from bringing or threatening to bring any action against any person or corporation for the infringement prior to the date of the Final Decree of any patents as defined in the Final Decree.

A stay of certain paragraphs of the final judgment was granted by Mr. Justice Reed of this Court January 2, 1946.

C. Summary Statement of Defendants' Position

A brief preliminary statement of our position may be helpful:

The Government's case was based on a series of closely related agreements made between 1920 and 1944. The agreements have been cancelled and continuation or renewal has been enjoined. The appeals are greatly simplified by the fact that we accept the cancellation and the injunction against continuation or renewal. We submit, however, that the court went too far in forbidding normal and usual contractual arrangements.

By reason of corporate changes and stock acquisitions (for example, National acquired the stock of the Norwegian company with which the basic 1920 agreement was made), the amendment and cancellation of agreements, the termi-

nation of agreements and relationships and change of conditions brought about by the war, legal questions presented by the agreements of 1920-44 are *now* mostly moot or insubstantial,—and we do not discuss such questions on these appeals. The agreements are important, however, as the principal legal events in the creation and development of the industry, and thus as indicating the form the judgment should take. For that reason they are described in our statement of facts (pages 11-49), which is taken largely from the trial court's findings (R. 234-306).

We do object to certain provisions of the judgment, as follows:

Paragraphs 1, 2, 3, and 4 consist solely of definitions and a list of abbreviations used to identify the defendants and co-conspirators (R. 309-10). No objection is made to these paragraphs.

Paragraph 5 cancels the agreements listed therein and enjoins further performance of any of the provisions of the agreements and of any agreements amendatory thereof or supplemental thereto (R. 310-12). No objection is made to the cancellation of the agreements. Objection is made to the injunction against further performance of any of the provisions of the cancelled agreements or any agreements amendatory thereof or supplemental thereto. We believe that this language is too sweeping in its effect and that these defendants should not be restrained in perpetuity from making normal and usual arrangements with other producers of titanium products.

Paragraph 6 enjoins and restrains the defendants and all persons acting for them from entering into any plan or understanding among themselves, the co-conspirators, or

with any third party which has as its purpose or effect the continuing or renewing of any of the provisions of the agreements cancelled in paragraph 5 or any new plan or agreement which has as its purpose or effect (*1*) to divide sales or manufacturing territories, (*2*) to allocate markets, (*3*) to limit or prevent United States imports or exports, (*4*) to grant to any third party any market as its exclusive territory, and (*5*) to keep any third party out of any market. Normal and usual arrangements between any defendant and its own directors, officers, employees, agents, subsidiaries, or any dealer or distributor, whether or not a co-conspirator, are exempt from subdivisions (*1*) through (*5*) (R. 312-13). No exception is given to such relations between producers of titanium products. Our objection to this paragraph is similar to our objection to paragraph 5. It is too broad in that it perpetually enjoins these defendants from entering into normal and usual arrangements among themselves and with other titanium producers. We do not object, of course, to an injunction against illegal provisions of the cancelled agreements or illegal provisions in new agreements.

Paragraph 7 orders the defendants to grant non-exclusive licenses on their patents (as defined in paragraph 4) to any applicant, including a defendant or co-conspirator, at a uniform, reasonable royalty. Such licenses may be conditioned on a reciprocal grant by the applicant of licenses under any titanium patents owned or controlled by the applicant. The defendants are also ordered (for a period of three years) to impart to their licensees in writing, at a reasonable charge, methods and processes used in their commercial practices. Jurisdiction is reserved to pass upon the reasonableness of any royalty or charge directed to be reasonable (R. 313-14). We shall argue that the facts of this case require royalty-free licensing of the patents as

defined. This case is distinguishable from *Hartford-Empire Co. et al.* v. *United States*, 323 U. S. 386 (1945); in order to give full force and effect to the District Court's opinion, findings, and conclusions, royalty-free licensing is essential.

Paragraph 8 orders these defendants to present to the court within one year from the date of the judgment a plan for divesting themselves of their interests in BTP, CTP, TG, and TK or in the alternative to purchase the entire stock or financial interests in said companies or any of them. The plan is to provide for its completion within two years from the date of the judgment (R. 314). Our objection to this paragraph is based on practical considerations such as tariffs, import licenses, government subsidies, and the extreme hardship imposed on National and Titan without any compensating gain to the Government or the public. The District Court refused to give any weight to economic factors, holding that this was a matter for the Congress and not for the courts (Opinion, R. 208).

Paragraph 9 is concerned solely with du Pont, except that it enjoins the defendants from bringing or threatening to bring an action for past infringement of any of the patents as defined in paragraph 4 (R. 314-15). No objection is made to this paragraph.

Paragraphs 10, 11, 12, and 13 are the usual visitation, costs, and reservation of jurisdiction clauses (R. 315-16). No objection is made to these paragraphs.

The judgment should be affirmed in so far as the court refused to grant divestiture of any part of the domestic titanium business of the defendants.

D. Statement of Facts

1. The Origin and Nature of the Business Involved

This case involves the creation of a new industry which, in a relatively short time, at steadily decreasing prices, has developed an important commodity, namely, titanium pigments (Finding 33, R. 246; Opinion, R. 207; Exs. NL 23, 24, Vol. IV, pp. 3948, 3949).

Titanium, the ninth most abundant element on the earth's surface, is contained in ilmenite and other minerals. Sand and rock formations containing ilmenite are found in India, the United States, Norway, Brazil, and elsewhere throughout the world (Finding 33, R. 245).

In and before 1920 there was no substantial trade or commerce in, and no commercial manufacture of, titanium pigments for use in paints, paper, rubber, or other products; pigments used for such purposes were lithopone, white lead, and zinc oxide. The use of metallic titanium in alloys was, however, under development by the Titanium Alloy Manufacturing Company (hereinafter called Alloy) at Niagara Falls, N. Y., and chemists engaged in that work (principally Barton and Rossi) were aware of the possibilities of titanium dioxide (hereinafter sometimes called TiO_2) as a pigment. Several important patents on processes and products had been taken out by them and a subsidiary, Titanium Pigment Company (hereinafter called Pigment), had been formed by Alloy to engage in further research, development, and promotion in the pigment field (Finding 33, R. 245-7).

Before 1920 tests and demonstrations conducted by Pigment had attracted the attention of large manufacturers of pigments and paints—Pittsburgh Plate Glass (paints), New

Jersey Zinc (pigments), the defendant du Pont (pigments and paints), and the defendant National (pigments). Of this group, National alone was sufficiently interested to invest in this new enterprise, and in 1920 purchased 10% of the stock of Pigment, securing at the same time an option to purchase up to 50% (Finding 33, R. 246).

The feature of TiO_2 that attracted the interest of chemists and paint manufacturers was its relatively high capacity to impart opacity and color (referred to as hiding power and tinting strength) to compositions treated (R. 853-4, 913-14). It was foreseen by Pigment and National before 1920 that if titanium pigments of good quality (that is, durable and satisfactory as to color and texture) could be manufactured economically, a substantial market could be created, and that to a large extent titanium pigments would be used in place of lithopone, white lead, and zinc oxide. In less than twenty years this vision was realized (Ex. NL 24, Vol. IV, p. 3949).

The chemists employed by Pigment at Niagara Falls had made small quantities of relatively pure TiO_2 before 1920. They believed, however, that manufacture of the pure product on a commercial scale would be costly in relation to other pigments, and they endeavored, therefore, to perfect processes for manufacture of "composite" pigments (that is, pigments containing TiO_2 and relatively large amounts of sulphates, such as barium sulphate or calcium sulphate and other less expensive materials) having hiding power and tinting strength per unit that, though not so high as pure TiO_2, would substantially exceed the hiding and tinting capacity of the other pigments then in use (R. 849-58). By 1920 process and product patents for titanium pigments developed by these chemists had been

granted in the United States, Norway, England, France, and other countries (Ex. NL 2, Vol. IV, p. 3822).

While the research and experimental work described above was going on in the United States, Gustav Jebsen, a Norwegian chemist and businessman, was making a similar investigation, albeit along different lines, in Norway—this in connection with his search for means of putting to industrial use large deposits of Norwegian ilmenite-bearing ore. By 1920 Jebsen and his associates had perfected processes patented in Norway, the United States, England, Germany, and in other countries, an important feature of which was disclosure of means for producing relatively pure TiO_2 pigments by direct application of relatively small quantities of sulphuric acid—a process much less costly than that then developed and in use experimentally at Niagara Falls. Though the Norwegian chemists were aware of the possibilities of "composite" pigments, they had not perfected processes for the manufacture of such products. In 1920 the process and product patents of Jebsen and his associates were held by Titan A/S, a Norwegian company (Finding 33, R. 246-7; R. 913-18). As early as 1914 Pigment had some knowledge of the work of Jebsen and his associates, and the latter were aware that processes were being developed in the United States. In 1914, while he was in the United States on other business, Jebsen conferred with the president of Alloy and Pigment with a view to the sale of Norwegian ilmenite and to the exchange of patents and technical information (R. 914-15). Owing to World War I, there was no further consideration of such exchange or cooperation until 1920; and during the war development work at Niagara Falls was at a standstill, though research and some experimental work and promotion were carried on (R. 868-9).

2. Commercial Developments in the United States (1920-1944)

In 1920 Pigment and Titan A/S made an agreement (described in detail below) whereby the American company was exclusively licensed under the Norwegian-owned patents for North America, with the right to grant sublicenses, and the Norwegian company was similarly licensed under the American patents outside North America. On the basis of this agreement, and utilizing the Norwegian as well as its own United States patents, Pigment (then and thereafter financed and in 1936 fully acquired by National) undertook a program for the development and promotion of titanium pigments as an economical and otherwise desirable substitute for the pigments then on the market (R. 876, 1054-66). That this program was commercially well conceived and executed is established by the fact that sales by Pigment (succeeded by National in 1936) steadily increased from 500 tons (in terms of TiO_2 content) in 1920 to 76,788 tons in 1944, while the price steadily dropped from 40¢ a pound in 1927 for TiO_2 (and correspondingly lower for "composite" pigments) to 14½¢ in 1944, and by the fact that in 1943 sales of titanium pigments by National alone exceeded sales of lithopone, zinc oxide, and white lead by all companies (Exs. NL 23, 24, Vol. IV, pp. 3948, 3949).

Increasingly aware of the possibilities of titanium pigments, by 1933 du Pont had obtained rights under the Blumenfeld patents (hereafter described) which disclosed processes having certain substantial advantages in respect of manufacture of pure TiO_2 over the Barton-Jebsen patents, but were not sufficient to permit use of the economical direct sulphuric acid attack or for manufacture of composite pigments. After a period of negotiations,—and in view of continued fear of prolonged, costly, and wasteful

patent controversy,—du Pont and National exchanged licenses. Du Pont thereupon adopted an aggressive development and promotion program, which was so successful that the company enjoyed a steady growth in sales; by 1935 it had captured almost 50% of the total United States sales of titanium pigments (in terms of TiO_2) (Ex. 41, Vol. I, p. 41).

Licensed by du Pont and National, American Zirconium Company entered the field in 1935. In 1937 Virginia Chemical Company entered the business, with a license from du Pont but not from National (Findings 31, 32, R. 244-5; Exs. H, H2, I, L, Vol. I, pp. 260, 277, 282, 397).

At no time were there imports of any consequence from abroad. In and after 1922 the tariff applicable to titanium compounds was 30% *ad valorem* (Finding 43, R. 251).

3. The 1920 Agreement

A minority stockholder of Pigment with an option to purchase up to 50% of the stock, National was unwilling to make further investment or commitments for development and promotion of titanium pigments unless and until it was satisfied that Pigment was in a position to use the Jebsen (as well as the Barton-Rossi) processes without risk of litigation (R. 919), and, accordingly, at the instance of National, Jebsen came to the United States in 1920 for the purpose of negotiating an agreement under which National would be free to practice the Jebsen inventions and Titan A/S would be free to make use of the inventions of Barton and Rossi (R. 918). The two sets of processes and patents were regarded by the parties as essential to development and manufacture on a satisfactory commercial scale of a line of titanium pigments comparable in respect

of possible uses, and superior in point of quality and economy, to the other pigments then on the market (R. 919, 870-2, 910-11). Accordingly, an agreement negotiated by McCarty, a vice-president of National, now dead, and Jebsen was executed July 30, 1920 on behalf of Pigment and Titan A/S (Ex. A, Vol. I, p. 1). As stockholders in Pigment, National and Alloy bound themselves in separate contracts with Pigment and Titan A/S to "respect" the principal agreement of July 30, 1920 and to communicate technical information, and they assigned all patents, inventions, and experiments in the "licensed field" to Pigment (Exs. A1, A2, Vol. 1, pp. 20, 24).

The features of the 1920 agreement essential to understanding of the case may be summarized as follows:

(*a*) The field within which licenses were, and technical information was to be, exchanged was defined as including all substances containing above 2% of titanium (unless such substances contained by weight more than 5% of a metal other than titanium in its purely metallic state) and all apparatus, methods, and processes useful in obtaining or manufacturing such substances (except as stated). The intention was to cover processes, substances, and apparatus in the titanium compound field. (R. 920)

(*b*) Pigment received "a license exclusive of all others including" Titan A/S in and for North America (defined as including the continent of that name, Central America, and Panama) under all existing or future patents of the Norwegian company, and Titan A/S was granted the same rights outside North America under the patents of Pigment. The parties agreed not to sell outside their respective territories, except that reciprocal non-exclusive rights of sale were reserved for South America. (R. 922)

(c) Detailed provision was made for exchange of copies of applications for patents filed by the parties or their licensees, and for the filing and payment of expenses incidental to the prosecution of such applications and maintenance of patents in territories outside the territory of each; and there was provision for assignment by each company to the other in case either party elected not to prosecute applications or maintain patents outside its territory. (R. 925)

(d) To implement the exchange of exclusive licenses, Titan A/S made Pigment the exclusive agent of Titan A/S for sales to Titan A/S in North America, such sales to be at prices and on terms determined by the agent, and Pigment similarly made Titan A/S its sole agent for sales by Pigment outside North America and South America. (With a view to "the widest possible development of titanium products in the 'Licensed Field'", it was agreed that, notwithstanding the agencies provided for, importations of "finished articles"—that is, paint, paper, rubber, glass, &c.—containing titanium products of the principal, its licensees or sublicensees, would be permitted provided such products did not constitute such an important part of such finished articles that sales within the agent's territory would substantially interfere with the agent's sales of its own titanium products. Written in 1920 before there was any trade or commerce in titanium pigments, much less in articles containing such pigments, this anticipatory restriction on sales of finished articles has always been a dead letter; it has never been applied, and has never had any importance or effect whatever.) (R. 926-7)

(e) It was the purpose of the parties, and especially of McCarty and Jebsen, that the exchange of licenses should promote the maximum development and practice of art; and to the end

(*i*) that the licenses received by each company would be fully utilized, and

(*ii*) that neither would be inclined or able to withhold information from the other, or make use of inventions or developments of the other for or in connection with further inventions or developments not fully shared with the other, it was agreed that each would impart semi-annually to the other full and accurate information in detail as to knowledge obtained in and applicable to the "licensed field", and would permit the other to inspect and study operations at its plants (exclusive of research laboratories). (R. 927)

(*f*) In line with the plans and purposes referred to, the parties agreed that the reciprocal grants of exclusive licenses would be for sixteen years (to December 31, 1936), and thereafter for periods of ten years each, with provision for termination by notice to be given at least five years before the end of any such period; and it was agreed that upon such termination each would receive for itself and its licensees within its territory a non-exclusive license under inventions covered by existing patents or applications of the other, but that in other respects the obligations, liabilities, and benefits would cease. (Notice of termination has never been given.) (R. 927-8)

(*g*) In Article XIV of the 1920 agreement (mentioned by number because of its significance in connection with later agreements) it was provided that each company would have the right, so long as it held an exclusive license from the other under the 1920 agreement, to grant licenses under its own patents and sublicenses under the other's patents on condition, nevertheless, that every such licensee or sublicensee would

(*i*) grant to the party to the 1920 agreement other than its licensor patent rights in the "licensed field" identical in character, territorial scope, and duration to those given by its licensor to the other party to the 1920 agreement,

(*ii*) appoint such other party its sole agent as specified above in respect of its licensor, and

(*iii*) impart technical information to such other party in the same manner and to the same extent as its licensor. (R. 928)

The terms of the 1920 agreement reflected the desire of McCarty, on behalf of National, to establish a sound technical foundation for a new American industry and the desire of Jebsen, in the interest of Titan A/S, to secure the right to use the American inventions and to obtain the benefits of the vast technical experience, knowledge, and facilities of a large American company which had been engaged successfully for many years in the manufacture of pigments other than titanium pigments, without risking possible commercial competition by that company in areas outside North America in which Jebsen saw opportunities for development by his Norwegian company (R. 920-29). The agreement, based on exchange of patents and technical information, thus was intended to establish a relationship analogous to partnership, in which in the interest of the maximum development of a projected industry the participants would cooperate, would refrain from taking advantage of each other, and would guarantee that processes and information coming into the possession of one would be shared with the other (Exs. 244, 245, 248, Vol. II, pp. 1430, 1436, 1446).

The 1920 agreement was calculated to, and did, foster research, invention, and technical and commercial develop-

ments and resulted, in a relatively short period, in the manufacture and sale in large and steadily increasing amounts, and at steadily decreasing prices, of an important new commodity (Ex. NL 23, Vol. IV, p. 3948).

Between 1920 and 1927 Titan A/S suffered business and financial difficulties which led in 1927, at a time when I. G. Farbenindustrie, the German chemical combine, was negotiating for the purchase of its stock, then controlled by Norwegian banks, to purchase by National Lead of 87% of the stock of Titan A/S—Jebsen retaining 13% (Finding 47, R. 255). By 1932 National had acquired all of the stock of Pigment, and in 1936 acquired its assets and assumed its obligations (R. 929-30, 932-36). Since 1929 the rights and obligations of Titan A/S under the 1920 agreement have been held by defendant Titan Company, Inc., a Delaware corporation in which National now owns all the stock. (NL Answer, R. 48)

4. The French Agreement (1922-1927)

Between 1920 and 1927 commercial development was slow, even in the United States, where the resistance of manufacturers, painters, and other consumers to the new titanium pigments was less marked than it was abroad (Ex. NL 23, Vol. IV, p. 3948). (In 1921 Pigment sold 500 tons, in terms of TiO_2 content, and even in 1927 it sold only about 2,000 tons. In the latter year it was still selling at a loss, though prices were relatively high. This was possible only because National was financing the development by advances and purchases of stock (R. 873-4).) During the same period Jebsen faced serious difficulties in Europe. Using the Barton-Rossi patents, he introduced "composite" pigments which were much less expensive than the pure TiO_2 previously manufactured, but he endeavored with

little success to establish markets in Norway and Sweden, England, France, Holland, and Belgium; and by 1927, when National purchased 87% of Titan A/S, the capital of the Norwegian company was greatly reduced and it was heavily indebted to the banks (R. 929-30).

In France, where there was a tariff on titanium, Jebsen endeavored to work with local interests. He negotiated with one French group and then another with a view to manufacture in France under licenses similar to those held by Pigment and Titan A/S. It transpired that the first group was incapable of developing and promoting the new product and the second group gave up because they thought it would take too long to establish a market. Finally, Titan A/S and National purchased the second group's interest in Société Industrielle, a French company which had been and thereafter was used as the selling agency for pigments shipped from Norway or Germany. Titan A/S owned about 20% of the French company, National acquired an additional 58% which, in 1929, was transferred to Titan, and the remainder was held in France by the public (R. 930-32).

In a letter written to Société Industrielle in March 1927, Jebsen confirmed on behalf of Titan A/S a "Protocol" of May 1925 under which there was an exchange of licenses consistent in material detail with the exchange effected by the 1920 agreement described above (Ex. B, Vol. 1, p. 29). Subject to mutual obligations and restrictions like those assumed and imposed by the 1920 agreement, the French company received rights at the disposal of the Norwegian company for France, its colonies and possessions. It was stipulated that the exclusive licenses would remain in force until December 31, 1941, and thereafter for ten-year periods,

subject to termination by notice given at least six years before December 31, 1941, or before the expiration of any subsequent ten-year period. Notice of termination has not been given. In 1929 the rights of Titan A/S in the French agreement were transferred to Titan (R. 936-37). The hope that the French company would use its license from the Norwegian company to manufacture in France, thus contributing to the fund of processes and technical information available to Titan A/S and Pigment, was not realized. Société Industrielle served merely as a local selling agency for pigments produced elsewhere (R. 932).

5. The German Agreements (1925-1927)

After 1925 I. G. Farbenindustrie was the largest company in Germany—one of the largest chemical companies in the world—with vast interests and important connections throughout the world and especially in Central Europe. Its manufacturing resources and facilities and its research and sales organizations were unsurpassed anywhere. From Jebsen's point of view, IG was, obviously, a most important factor in entering the German market. He was fearful that IG would absorb his Norwegian company (IG was negotiating for the purchase of the Titan A/S stock held by certain Norwegian banks) and, knowing IG's power and reputation in Germany, he was interested when it approached him with a view to obtaining a license (R. 932-36). Jebsen knew that to succeed in his own enterprise he would have to come to terms with IG. German manufacturing conditions and costs were so favorable—sulphuric acid cost in Germany was one-half the cost in Norway or England—that Jebsen looked upon a connection with IG as affording a congeries of advantages, including vast research and development and sales facilities, capacity for

cheap manufacture for all or most of Europe, and a profitable market for large quantities of Norwegian ilmenite (R. 936). So confident were the Germans of their manufacturing capacity and costs that they offered, in consideration of a license, to buy Norwegian ilmenite at cost plus 30 to 50% (depending on the exchange rate) and to supply Titan A/S with titanium pigments at cost (R. 934). In 1924 or 1925 Jebsen had investigated another German company which had manufactured titanium pigments on a very small scale and which held certain patents but had concluded that the company's prospects were not of sufficient interest to warrant an association. There was no other manufacturer in Germany, and there was no demand by paint manufacturers and other consumers, who were accustomed to other pigments, including lithopone, manufactured by IG (R. 934).

Having saved his Norwegian company from purchase by the Germans, and having at the same time secured the backing of National, and believing that it would be impossible for him to undertake manufacture in Germany and sell in Germany and German-dominated territory without the cooperation of IG, Jebsen proceeded to negotiate a series of agreements, as follows (Exs. C-C8, Vol. 1, pp. 46-86):

(*a*) For the purpose of cooperating in the manufacture and sale of titanium and titanium compounds in Germany, Russia, Austria, Hungary, Czechoslovakia, Switzerland, Rumania, Serbia-Croatia-Slovenia, Bulgaria, Greece, Turkey, Japan, China, and Spain, Titan A/S and IG undertook to organize a German company, Titangesellschaft, to which each would contribute one half the initial capital. The parties were to have an equal voice in the selection of the "managers", but responsibility for policy and overall supervision was placed in the

hands of Jebsen and a representative of IG. It was stipulated that titanium compounds for sale in the countries referred to would be manufactured by Titangesellschaft, and that the parties would cover their total requirements in those areas from Titangsellschaft. It was agreed that Titangesellschaft could not be dissolved before the end of 1957, and then only on six months' notice; thereafter it could be dissolved on such notice at the end of any successive ten-year period.

(*b*) Further to secure the cooperation of IG, it was agreed that IG would grant Titangesellschaft an exclusive license, with the right to grant sublicenses, under all patents, methods, and experience of IG in the "licensed field" and would supply Titangesellschaft with copies of applications for German patents and, at the request and expense of Titangesellschaft, would prosecute similar applications in countries designated by Titangesellschaft; and it was agreed by Titan A/S and Titangesellschaft that they would exchange licenses and technical information and conduct their operations in and with reference to Germany and the other countries referred to in accordance with the principles of the 1920 agreement between Pigment and Titan A/S. (It was stipulated that Titan A/S might "substitute for itself" in these agreements another company or other companies in which Titan A/S and National, or either of them, were "engaged" 100%; and, subject to immaterial exception, Titan subsequently did take over the rights and obligations of Titan A/S.)

(*c*) In a series of ancillary agreements IG undertook

(*i*) to provide a factory site and building near its Leverkusen works (rent at 6% of the value of the building);

(*ii*) to furnish steam, gas, water, and electricity (at cost),

(*iii*) to supply transportation facilities (at reasonable prices), and

(*iv*) to deliver raw materials (at cost plus 10%, but not more than the competition charged, with provision for "most-favored" customer treatment). IG was appointed agent of Titangesellschaft for sales in the countries mentioned.

(*d*) Worthy of special reference as bearing on Jebsen's plan to advance as rapidly as possible the production and sale of high quality, economical titanium pigments,—that is, really to compete on the most favorable possible basis with other pigments,—and at the same time to build up a large and consistent market for Norwegian ilmenite, is

(*i*) the agreement of Titangesellschaft to satisfy its ore requirements by purchases from Titan A/S at cost plus 40-50% (stated in terms of Norwegian Gold Kroner, and favorable to Titan A/S because of exchange factors), and

(*ii*) in view of Jebsen's high costs and his intention to close down his Fredrikstad plant, the agreement of Titangesellschaft giving Titan A/S the right to take 50% of the pigments produced at Leverkusen at cost (and quantities in excess of 50% at cost plus 10%).

Titangesellschaft was organized and did operate in accordance with the agreements described. It purchased large quantities of ore from Titan A/S at a satisfactory price (R. 935). The conviction that it would be a fertile source of inventions and technical information useful in the United States and England particularly, as well as in Germany, was confirmed. Thanks to IG's 50% interest in

the company, Titangesellschaft was able to make use of IG's superb sales organization to push the sales of titanium pigments at the expense of other pigments (including lithopone made and sold by IG) in markets not accessible to National or Titan A/S. Its costs and prices were low, its quality high. The arrangement under which Titan A/S (Titan after 1929) was able to obtain pigments at cost proved to be of great value as soon as manufacture at Leverkusen was commenced, and especially in respect of sales in the British market, where Jebsen had been able to make limited headway with his high priced pigments and where there was no manufacture until about 1934 (R. 936).

All relations between National or Titan and IG or Titangesellschaft were terminated by the declaration of war in December 1941. National has written off its investment in Titangesellschaft; it will not resume or enter into agreements containing territorial restrictions; and its plans and ability to carry on business relations with German companies after the war depend entirely upon provisions to be made for German industry and trade by the Allied Governments (R. 937, 1106).

6. The British Agreements (1933)

I. G. Farbenindustrie A. G. was organized in 1925 as a merger of the largest chemical and dye producers of Germany. These producers had operated under a "Community of Interest Agreement" since 1916 and under various cartel agreements since about 1900 (Ex. NL 34, Vol. IV, pp. 4144-7). After 1928 the merged enterprise had capital in excess of $250,000,000 ($420,000,000 after devaluation of the dollar) (Ex. NL 34, Vol. IV, p. 4145). By virtue of excellence of management and resources, IG was the leading chemical enterprise of the world (*ibid.*). The weakness

of the British and Americans in chemical and dye stuffs had been demonstrated in World War I. Aware of this weakness, and alert to what was going on in Germany, the British decided to act. In 1926 they organized Imperial Chemical Industries, Limited, as an amalgamation, sponsored by the British Government, of the leading British chemical companies. With assets exceeding £100,000,000, I. C. I. was the largest manufacturer of chemicals in the British Empire and was intended to, and did, rival IG in respect of research, manufacture, and trade (Finding 17, R. 241). I. C. I. was the agency by which the British chemical industry sought to, and did, secure self-sufficiency and dominance throughout the Empire (Ex. NL 34, Vol. IV, p. 4123).

Jebsen had attempted for years to establish a British market for his pigments, but with limited success (R. 938). The traditional conservatism of the British manifested itself in the habits and attitude of paint manufacturers and master painters who were accustomed to pigments of domestic origin. "Buy British" was more than a slogan—it was a stubborn and formidable fact (R. 949). Knowing from costly experience that he could not hope successfully to invade, much less to capture, the British market without a strong local alliance, Jebsen set out to obtain one. Though I. C. I. had never manufactured pigments, it was, obviously, the most desirable British partner; for it had resources in the way of technical and chemical facilities, raw materials, &c., not possessed by any other firm (R. 939). Imperial Smelting Corporation, Limited, and Goodlass Wall and Lead Industries, Limited, were also natural allies. I. S. C. was the largest British manufacturer of zinc and lithopone; it could supply sulphuric acid; it had important connections throughout the Empire; and it had strong management friendly to National (R. 942). Goodlass Wall, a

government sponsored amalgamation of lead companies, was brought in for similar reasons (R. 939; NL Answer, R. 42).

In February and March, 1933 Titan, I. C. I., I. S. C., and Goodlass Wall entered into a series of agreements, as follows (Exs. F-F7, Vol. I, pp. 119-71):

(*a*) Based on factual premises as to patents and processes of Titan and a record of successful commercial manufacture in Germany and the United States, the right of manufacture and sale of titanium compounds throughout the British Empire (excluding Canada, Newfoundland, and certain other areas) was vested in a new company, British Titan Products, Limited; and I. C. I., I. S. C., and Goodlass Wall agreed that they would not deal in or manufacture such compounds except through or at the request of British Titan. Subject to restrictions on transfer, the voting shares of British Titan were distributed among Titan—49% (with the right to allot 5% to R. W. Greef & Co., Ltd., which had been the British sales agent of Titan A/S and, later, Titan), I. C. I.—17%, I. S. C.—17%, and Goodlass Wall—17%. Titan received the right to name three of the six directors, but it was stipulated that the chairman must be one of the directors named by the British shareholders. The agreement was for thirty years, with severely limited provisions for retirement.

(*b*) It was agreed by Titan and British Titan that they would exchange licenses, patent applications, and technical information, and conduct their operations in and with reference to the British Empire (excluding Canada, Newfoundland, and certain other areas) in accordance with the principles of the 1920 agreement above described (page 16).

(c) In order to vest in British Titan and Titan (and its licensees) all the benefits of their research and development, I. C. I., I. S. C., and Goodlass Wall each gave British Titan an exclusive license in respect of I. C. I.'s, I. S. C.'s, and Goodlass Wall's patents, processes, and subject matter within the "licensed field" (limited in the case of I. C. I. to titanium oxide or titanium pigments) for the production of titanium compounds, with the right to manufacture, use, or sell compounds so produced, and with the right to grant sublicenses; and each such grantor agreed that it would supply British Titan with copies of its applications for patents in the "licensed field" and, at the request and expense of British Titan, would prosecute similar applications in countries designated by British Titan.

(d) The 125,000 non-voting shares of £1 each of British Titan were allotted to Titan in consideration of its exisfing business and good will in the British Empire and its agreement to make available to British Titan all technical knowledge and experience at its disposal in the manufacture of titanium products or relating to the marketing thereof in the British Empire.

(e) The right of Titan A/S to buy 50% of the German production at cost (and more at cost plus 10%) having been transferred to Titan, the latter agreed until such time as British Titan commenced to manufacture, and for two years thereafter, to supply British Titan's requirements at cost.

Located near the I. C. I. factory at Billingham, and in charge of a former I. C. I. employee, the British Titan factory commenced operations in 1934 and has operated successfully ever since (R. 946). Plans were made for substantial increase of production after the war, and these

plans are now being put into effect. The choice of partners was most fortunate. Apart from inventions and technical facilities and information of great value, I. C. I., I. S. C., and Goodlass Wall have supplied management and sales experience and advice of a high order (R. 946).

In February, March, and April 1943 there were conversations between representatives of National Lead and members of the Antitrust Division, Department of Justice, relating to a proposed consent decree (Ex. NL 1, Vol. IV, pp. 3817-21). The conversations were suggested by the Division's pending investigation of the titanium pigments industry and antedated the indictment against the defendants herein and Messrs. Rockwell, Garesche, and Jobsen of National Lead, and another, returned in the Southern District of New York June 28, 1943. It was impossible to find a basis of agreement and the conversations were terminated. Thereafter the indictment (No. 114-455) was returned. Following the consent decree discussions with the Antitrust Division in the spring of 1943, there were conferences between the attorneys for National Lead and the president of the company (Rockwell) at which the Division's objections to certain contracts were discussed and consideration was given to the position of the company in respect of performance of and compliance with the contracts pending trial. Owing to the war production of the company, it was thought that no case would be tried during the war. It was the position of the president that in view of the probable delay it would not be prudent, and he did not desire, so far as it was practicable to avoid it, to permit the company to continue to operate in accordance with provisions which had been criticized by the Government; and the attorneys for National Lead were instructed to protect the company against the possible charge that it had persisted in a course of action after the

Government's objections had been made known and, if possible, to take steps to revise the contracts in such a way as to meet the objections and at the same time avoid unnecessary sacrifice of the company's investments and other interests. The basis of the Antitrust Division's criticism of National Lead, both in the indictment and in the complaint in this action (filed June 24, 1944), is the 1920 agreement between Pigment and Titan A/S. The agreement, containing certain restrictions objected to by the Antitrust Division, might have been terminated or relinquished in some way but for the fact that its terms had been carried over in part into contracts between National Lead and I. C. I., I. S. C., Goodlass Wall, and British Titan,—and also into Canadian agreements described below,—and that in such agreements certain provisions had been conditioned on the 1920 agreement. Because of the foregoing, the attorneys for National Lead concluded that they could best serve their client by formulating, and endeavoring to have the parties approve, further agreements between National Lead and the British and Canadian companies which would remove features of the agreements criticized by the Antitrust Division and, in particular, provisions based upon the existence and terms of the 1920 agreement. Substantial progress in this direction was made; and at a pre-trial conference in this case held October 30, 1944 counsel for National Lead tendered a form of contract agreed to, but not executed, by National Lead and the British companies. A copy of the proposed agreement was received in evidence at the trial (Ex. NL 30, Vol. IV, pp. 4066-72). The parties are I. C. I., I. S. C., Goodlass Wall, Titan, British Titan, and National Lead, and the agreement provides in substance as follows:

(a) Licenses exchanged by British Titan and National Lead (Titan) will be non-exclusive and royalty free, with the right to grant non-exclusive sub-

licenses but only to parties who will license British Titan or National Lead, as the case may be, on a non-exclusive, royalty-free basis under the patents and applications of such sublicensees.

(*b*) The licenses will be without restriction as to production, shipment, sale, or use of titanium compounds; and it is provided that neither the 1933 British agreements nor the 1920 agreement will preclude British Titan or National Lead (or Titan) from manufacturing, selling, or using in, or from shipping from or to, any place in the world, titanium compounds or any product, finished or unfinished, or from otherwise fully exercising the grants made by them.

(*c*) It is agreed that the holdings of voting shares in British Titan will be rearranged so as to insure that National Lead (or Titan), I. C. I., I. S. C., and Goodlass Wall will each hold the same number of shares.

(*d*) The right of National Lead to name three directors of British Titan is cancelled, and National Lead has agreed to refrain from taking any part in or exercising any influence in respect of deliberations or decisions of British Titan concerning any business of British Titan within, from, or to the United States.

(*e*) All restrictions on the disposition by National Lead of its shares of British Titan contained in the 1933 agreements are cancelled, and it is agreed that the Articles of Association will be amended to remove therefrom all such restrictions.

(*f*) The proposed agreement supersedes, in so far as inconsistent therewith, the 1933 agreements, and to the extent that any provision or provisions of the 1933 agreements are inconsistent therewith they are deemed to be amended.

(*g*) The license agreement between Titan and British Titan made in March 1933 is cancelled.

(*h*) The agreement for exchange of licenses under patent rights hereafter acquired may be terminated by British Titan and National at the end of any year by three years previous notice in writing, or by National by notice given at any time pursuant to order of the United States District Court, or by British Titan by notice given at any time pursuant to order of competent authority in Great Britain pursuant to the Defense Regulations 1941 or pursuant to the order of any competent court in Great Britain.

The proposed agreement was negotiated and submitted in good faith as a means of meeting objections made by the Antitrust Division, and at the same time of avoiding litigation in England on claims that might be asserted against National Lead or Titan by the British companies, and of conserving National Lead's investment in British Titan.

British Titan was not the only manufacturer of titanium pigments in the British Empire. A small company, National Titanium Pigments, Limited, known as Laporte, having acquired rights under the so-called Tilden-Smith patents and under the Blumenfeld patents for the British Empire, entered into agreements with British Titan fixing prices in the British market excluding Canada (Exs. 675, 670, Vol. III, 2484, 2469). Though National was represented on the board of British Titan when these agreements were made, they were not made at the instance of Jebsen or National (or Titan) but were made by British Titan, acting independently, with reference to business and legal considerations respecting which neither National, Titan, nor Jebsen had responsibility or influence (R. 963). In view of war conditions existing in 1941, British Titan and

Laporte, with the support of the British Government, agreed upon a quota arrangement under which British Titan was assigned 80% and Laporte 20% of sales in the British market (Ex. F8, Vol. I, pp. 173-7).

7. The European Agreements (1933-1935)

Joseph Blumenfeld, chemist and managing director of Société de Produits Chimiques des Terres Rares (Terres Rares), a French company in which he owned stock, prior to 1922 obtained certain patents relating to the manufacture of titanium compounds which he assigned to Terres Rares. Between 1922 and 1933 Terres Rares granted exclusive licenses to Fabriques de Produits Chimiques de Thann et de Mulhouse (called Thann), a French company, for France, its colonies, dependencies, protectorates, and mandated territories; to Societa Anonima Titanium (Montecatini), the largest chemical company in Italy, for Italy, and non-exclusive licenses for Belgium, Holland, Switzerland, Spain, Portugal, and South America, subject to rescission on three months' notice; to Verein für Chemische und Metallurgische Produktion Aussig (Aussig), the largest chemical company in Central Europe for Czechoslovakia, Austria, Hungary, Yugoslavia, Rumania, and, subject to certain obligations, Danzig and Denmark, and non-exclusive licenses for Poland and Russia; and to Laporte for the British Empire. Terres Rares sold its United States titanium patents to Commercial Pigments Company, a United States corporation; these patents were later acquired by du Pont (Finding 34, R. 247; R. 782-831, 951-3).

Jebsen, confronted with the economic and political problems indicated below, acting for Titan, either made or approved agreements among the European producers as follows:

(*a*) In 1933 Aussig and Titangesellschaft entered into an agreement which established a sales quota of approximately 25% for Aussig and 75% for Titangesellschaft in Germany, Czechoslovakia, Poland, Austria, Hungary, Yugoslavia, Rumania, and Russia. Prices were to be fixed by mutual consent, but not so high as to impair sales, and were not required to be identical, so that each firm could compete with dealers in other pigments (lithopone, zinc oxide, white lead, &c.) as local conditions might permit. Each gave the other the right to use its product patents and agreed to support the other in protecting these rights. Aussig agreed to buy from Titangesellschaft at preferential prices any requirements of titanium pigments above Aussig's then production capacity which Aussig might need to meet its quota. (This provision, made to enable Titangesellschaft to reduce costs through increased production and Aussig to buy at a favorable price, was effective only until Titangesellschaft's capacity was fully utilized.) Responsibility for the quality of the products was to rest on the manufacturer. (Ex. G, Vol. I, p. 178).

(*b*) Some time in 1935, but to take effect as of May 1, 1934, an agreement known as the Contrat a Quatre was made between Thann and Terres Rares on the one hand and Société Industrielle and Titan, on the other, which established a quota of 30% for Thann and Terres Rares and 70% for Société Industrielle and Titan in Belgium, Holland, and "various countries" (Esthonia, Latvia, Lithuania, Abyssinia, Liberia, Arabia, Afghanistan, Persia, and Siam) and a 50% quota for each group in France; prices for these territories were to be fixed by mutual consent; product patents of each party were to be made available to the others. This agreement could be terminated by a change of sales possibilities resulting from governmental meas-

ures, from "new competition", or from "any governmental or legislative measures making it partly or wholly illegal". Otherwise it could not be terminated before December 31, 1938, and then only on six months' notice. Thereafter it was to continue for two-year periods unless notice was given six months before the expiration of any such period. This agreement was related to the Contrat a Six (see below) and could be terminated on three months' notice if that agreement was terminated. (Ex. G1, Vol. I, p. 197)

(c) At the same time an agreement known as the Contrat de Livraisons (agreement concerning mutual deliveries) was made between the same parties and provided that each group would supply the other with any titanium pigments which it might have available after its own needs were satisfied, at certain fixed prices and on certain terms. It was agreed that goods delivered by one group to the other could not be reexported and that this obligation must be imposed on the customers of the parties. (Ex. G2, Vol. I, p. 221)

(d) An agreement known as the Contrat a Six was also entered into at this time by Thann, Terres Rares, Montecatini, Titan, Société Industrielle, and Titangesellschaft, in which Titangesellschaft and Aussig were given exclusive rights of sale and delivery in Germany, Danzig, Czechoslovakia, and Russia; Titangesellschaft, Terres Rares, and Thann in Spain, Portugal, Japan, Switzerland, Bulgaria, Greece, Turkey, China, and South America (subject to Titanium Pigment's rights in South America); Terres Rares, Thann, and Société Industrielle in France; Terres Rares, Thann, and Titan in Belgium, Holland, and "various countries" (as defined above); Montecatini in Italy; Titan in Norway, Sweden, and Finland; and Titan and Aussig in Denmark. Each party

agreed to respect the others' exclusive rights. This agreement had the same termination provisions as the Contrat a Quatre, and was terminated by Montecatini on December 31, 1938. (Ex. G 3, Vol. I, p. 233)

The European agreements and arrangements just described were shaped by political, economic, and legal considerations which may be briefly stated as follows: In 1927 a world economic conference was called by the League of Nations for the purpose of discussing and, if possible, taking steps to cure the economic ills of Europe caused by World War I. For example, the industries of Bohemia, established for a market of 50 million people, found themselves with 13 million Czechoslovakians as their domestic market; they had to seek an outlet for excess production. Tariff barriers were erected and import license systems inaugurated to protect domestic manufacture; and countries with weak currency subsidized export industries in order to bolster their currency. These economic complications, characteristic of Europe in the 20's and 30's, led to cartelization to protect domestic industry, including the prevention of dumping by companies subsidized by their governments. A company wishing to do business in Europe at the time was forced to come to terms with domestic industry and thus to participate in cartel agreements (R. 1127-9, 954-5, 798; Ex. NL 34, pp. 4108-72).

8. The Japanese Agreements (1936)

Because of increasing difficulty with Japanese tariffs and import licenses, and because of the probability of independent manufacture of titanium products in Japan and dumping on world markets, a pool agreement was made in 1936 by Terres Rares, Titan, and IG, under which Terres

Rares and Titan, together with the Japanese firm of Kokusan Kogyo, undertook to form a new company, Titan Kogyo, for the purpose of erecting a titanium factory in Japan (Ex. J, Vol. I, p. 292). The Japanese firm was to own 50% of the new company, Terres Rares 30%, and Titan 70% of the remaining 50%. IG was to have an option on one-half of Titan's shares. Terres Rares and Titan authorize Doitsu (IG's selling agency in Japan) to act as trustee for them in the new Japanese company. This agreement was to last as long as any of the parties owned stock in Titan Kogyo. The proportionate interests of the parties in the Japanese market had been determined by the European agreements described above (page 34).

Doitsu and Kokusan Kogyo agreed that Titan Kogyo would be licensed under Titangellschaft and Titan Japanese patents in substantially the same manner and subject to the same terms as in the German and British agreements described above (pages 22, 26) (Exs. J1-J8, Vol. I, pp. 290-341). Titan Kogyo was given an option on Blumenfeld's Japanese patents in exchange for certain rights to be given Terres Rares and Thann (Finding 54, R. 264-6).

9. The Canadian Agreements (1937)

National, under certain Canadian patents and by virtue of the 1920 agreement described above (page 16), had an exclusive license and the right to grant sublicenses under Titan A/S's Canadian patents (Ex. A, Vol. I, p. 1).

Before 1937 National supplied the Canadian market through Wilson, Paterson & Gifford and permitted British Titan to sell through the same agency (Exs. 674, 649, Vol. III, pp. 2481, 2416). Sales were small and the market undeveloped in relation to rival pigments, such as lithopone,

white lead, and zinc oxide. Beginning in 1935 National, realizing the need for a strong local alliance, began negotiating with Canadian Industries, Ltd., called C. I. L., the largest chemical company in Canada, 86% of whose stock is owned by I. C. I. and du Pont in equal shares, for the purpose of forming a company to manufacture and sell titanium pigments and compounds in Canada. As a result of these negotiations four agreements were made in 1937, as follows (Exs. K-K 3, Vol. I, pp. 342-80):

(a) There was an agreement between C. I. L. and National Lead under which a new company, Canadian Titanium Pigments, Ltd., was granted the sole right to manufacture and sell under C. I. L.'s and National Lead's titanium patents in Canada and Newfoundland. Canadian Titan was to be owned 49% by National Lead and 51% by C. I. L. In addition, National Lead was to receive 8,000 shares of non-voting (except under certain conditions) $100 par value stock in consideration of its existing good will, patents, and technical information. National Lead and C. I. L. agreed to subscribe to bonds of Canadian Titan for the purpose of erecting a factory; but because of World War II the bonds have not been issued and the factory has not been built. Canadian Titan was to have six directors, three nominated by National Lead and three by C. I. L.; one of the C. I. L. directors was to be president. Until the factory was built, National agreed to supply Canadian Titan at cost plus 10% and to use its best efforts to enable Canadian Titan to purchase from British Titan at cost plus 10%. The agreement was to remain in force for thirty years, and thereafter could be terminated on twelve months' notice by either party. If at the end of thirty years either party wished to withdraw from the agreement, it was required to offer its shares

to the other party at book value. (In determining book value good will, patents, and future earnings were not to be considered.)

(*b*) It was agreed that National Lead and Canadian Titan would exchange licenses, patent applications, and technical information in accordance with the principles of the 1920 agreement above described. No restrictions were placed on the sale of finished products by the customers of either party. Both National and Canadian Titan could grant sublicenses; and in order to insure the widest development of the field, sublicensees were required to grant licenses under their present and future patents to the grantor.

(*c*) C. I. L. and Canadian Titan entered into a similar agreement.

In 1937 Canadian Titan entered into a contract with Laporte under which Laporte transferred to Canadian Titan all the Canadian Titan patents which it then owned and further agreed to license Canadian Titan under any such patents which it might acquire during the life of the contract (fifteen years) (Ex. K 4, Vol. I, p. 382).

Before the trial negotiations were in progress among National, C. I. L, and Canadian Titan to revise the Canadian agreements on lines similar to the revised British agreements described above (pages 31-3) (Finding 58, R. 37). National has recently, however, agreed to buy all of C. I. L.'s interest in Canadian Titan.

10. The du Pont Agreements (1931-1941)

Before 1931 the United States rights under the Blumenfeld patents were held by Commercial Pigments Company (page 34 above); from 1931 to 1935 by Krebs Pigment and

Color Corporation, a Delaware company owned 70% by du Pont; after 1935 by du Pont, to which manufacturing assets of Krebs were assigned in 1935. Krebs was dissolved in 1943, and since then du Pont has conducted all its titanium pigments operations through its Pigment Department (DP Answer, R. 54).

Between 1920 and 1931 sales of titanium pigments by National slowly but steadily increased. In 1931 National sold 8,000 tons of titanium pigments in terms of TiO_2 content (Ex. NL 23, Vol. IV, p. 3948). While sales of all pigments declined in the depression year 1932, sales of titanium pigments fell off relatively little, and sales by National of titanium pigments exceeded total sales of white lead by all manufacturers (Ex. NL 24, Vol. IV, p. 3949). Titanium pigments were well on the way to overtake zinc oxide and even lithopone.

Engaged in the pigments and paint business on a large scale, du Pont saw the handwriting on the wall and set out to acquire patent rights and technical information necessary to manufacture efficiently and economically a full line of titanium pigments and thus to compete successfully with National in a potentially large domestic market (Exs. 192, 172, Vol. I, pp. 1114, 965).

Looking into the patent situation, du Pont found that the Blumenfeld patents, though important, were incomplete and inadequate. For example, the Barton-Rossi-Jebsen patents held or controlled by National stood in the way of manufacture of composite pigments, for which there appeared to be a substantial potential demand, and of use by Krebs (du Pont) of the cheap sulphuric acid attack, disclosed by Jebsen, in the making of pure TiO_2. Indeed, du Pont found that Commercial Pigments was then infring-

ing patents held or controlled by National, and that plans then under consideration for more extensive operation would, if carried out, entail further infringement (Exs. 207, 210, 213, 214, 215, 216, Vol. II, pp. 1252, 1283, 1293, 1295, 1300, 1309, 1313). It was not all one way, however, for the Blumenfeld patents disclosed processes which were attractive to National. National was particularly interested, for example, in processes disclosed by Blumenfeld which improved the quality of TiO_2. And it was seriously claimed by du Pont that National was infringing some of the Blumenfeld patents (Exs. 207, 210, 211, 213, 214, 215, 216, Vol. II, pp. 1252. 1283, 1293, 1295, 1300, 1309, 1313).

The record is replete with evidence of serious controversy between National and du Pont over patent rights, of the probability of protracted and costly litigation, and of a desire on the part of the two companies to effect a reasonable settlement of their difficulties in order that both might safely go forward on a sound technical basis with the development, manufacture, and sale of a relatively new product (Ex. 177, Vol. I, p. 986; Ex. 196, Vol. II, p. 1144).

Having decided to settle their differences and to release and expand the art rather than to attempt to destroy each other, National and du Pont, through Pigment and Krebs, entered into an agreement as of January 1, 1933 as follows (Ex. E, R. 69-72):

(*a*) They exchanged irrevocable, non-exclusive licenses, within the United States, to use all processes, methods, and apparatus relating to or in the "licensed field", whether or not patented or subject to patent, then or thereafter owned by them or otherwise at their disposal, with the right to sell products resulting from the exercise of such licenses in the United States, its colonies and possessions, Mexico,

Central America, the West Indies, and South America.

(*b*) They agreed to exchange technical information and experience.

(*c*) Each party agreed to assist the other to acquire an irrevocable, non-exclusive license, for the territory above described, under any patent or applications owned by or otherwise at the disposal of other persons, under which such party itself was licensed; and Krebs (du Pont) agreed that it would offer to any foreign associate of Pigment (National Lead or Titan), before offering to any other person, the opportunity to acquire, upon mutually satisfactory terms and conditions, an irrevocable, non-exclusive license under any patent relating to the "licensed field" issued in any country of Europe or in Great Britain which then was or thereafter might be owned by or otherwise at the disposal of Krebs (du Pont).

(*d*) It was provided that the agreement might be terminated at any time after December 31, 1933 on three years' notice, but not so as to affect licenses theretofore acquired.

(*e*) There was a mutual release of claims for infringement.

As of about May 1, 1940 the exchange of technical information between National and du Pont was discontinued; and the 1933 agreement was amended as of January 1, 1941 to eliminate provisions for exchange of technical information (Ex. E 3, Vol. I, p. 113).

In each of the years 1937 to 1941, inclusive, du Pont and Titan entered into patent agreements involving specifically designated inventions under the terms of which du Pont granted to Titan exclusive licenses, with the right

to grant sublicenses to one or more of the following, namely, Titangesellschaft, British Titan, Société Industrielle, and, from 1939 to 1941, inclusive, to Titan Kogyo, under certain specific patents and patent applications of du Pont in certain specified countries other than the United States relating to the manufacture of titanium compounds useful as pigments. Each of said licenses was for the particular countries in which the licensed patents and applications were issued or pending, du Pont reserving the right to use the inventions covered by such patents; and Titan, with the consent of National, granted du Pont non-exclusive licenses under certain specific United States patents and applications (Exs. M, N; Q, R, S, Vol. I, pp. 406, 412, 455, 470, 486).

The 1933 agreement between National and du Pont involved a substantial, material deviation from the principles and terms of the 1920 agreement between Pigment and Titan A/S, in that, in addition to granting licenses to du Pont under United States patents of National, the 1933 agreement granted sublicenses to du Pont under United States patents of the parties to the French, German, and British agreements, without at the same time securing the agreement of du Pont not to manufacture in or import into such territories. It was necessary, therefore, to secure the approval of the 1933 du Pont agreement by the parties to the French, German, and British agreements, and such approval was obtained (Exs. A, E, Vol. I, p. 1, R. 69; Opinion, R. 213-14; Finding 73, R. 280-9).

The 1933 du Pont agreement was negotiated chiefly by Rupprecht for du Pont and by Beschorman for National Lead. Rupprecht died prior to the trial (R. 1152). Owing to his retirement, illness, and residence in California,

Beschorman was not called to testify at the trial (Exs. 7, 13, Vol. I, pp. 504, 513). Letters written by Rupprecht and Beschorman, however, indicate that, while Rupprecht informed Beschorman that in view of patent and commercial considerations du Pont was not likely to manufacture in or import into the foreign territories of National Lead's associates, du Pont would not, and was advised and believed that legally it could not, agree to refrain from such manufacture or importation (Exs. 267, 273, Vol. II, pp. 1483, 1500).

While Jebsen had been notified by representatives of National of the negotiations with du Pont, his office and residence were in Paris, his authority and responsibility were confined to European operations in which Titan was interested, he did not participate in the negotiations with du Pont, and he was not asked to and did not approve the form of agreement with du Pont. Indeed, Jebsen regarded the proposed du Pont agreement as a radical and unfortunate departure from the principles and terms of the 1920 agreement, and so advised National (Exs. 242, 244, 245, 247, Vol. II, pp. 1419, 1430, 1436, 1445).

After the 1933 du Pont agreement had been negotiated, however, Jebsen was instructed by National to secure the approval thereto of the French, German, and British companies, and, recognizing but not approving the deviation referred to, he proceeded to carry out the instruction. Jebsen did not receive, nor did he understand that National had received, any assurance that notwithstanding the terms of the agreement du Pont had accepted the principles and terms of the 1920 agreement, or had agreed or would agree to refrain from manufacture in or importation into the territories referred to. Never at any time—not in 1933,

or 1938, or at any other time—did Jebsen understand that du Pont had accepted the principles or terms of the 1920 agreement (R. 959-63, 986-1052; Exs. 273, 274, 275, Vol. II, pp. 1495, 1502, 1504).

On the basis of the exchange of licenses and technical information between National and du Pont, from 1933 on there was the most active competition between the two companies—resulting in great improvement in manufacturing processes, a vast increase in sales, and repeated reductions in the price of titanium pigments (Finding 78, R. 290; Opinion, R. 207; R. 1065-7, 1155-61).

While for obvious business reasons National and du Pont have endeavored to match each other's titanium products, such products have never been identical and each manufactures certain titanium pigments having special applications not manufactured by the other (R. 1073-75).

There has never been any allocation of territory or customers between National and du Pont; and, indeed, each maintains a large, highly trained technical sales force engaged in endeavoring to capture the market for titanium pigments. To a very large extent the salesmen of the two companies are chemists whose contact with customers—that is, manufacturers of paint, rubber, glass, &c.—consists in demonstrating that their products merit acceptance on the basis of technical superiority. The buyers of titanium pigments are mainly well-informed, experienced purchasing agents, whose orders are placed solely on the basis of service and technical considerations brought to their attention by chemists and other technicians employed by the consuming companies (Finding 78, R. 290-1; R. 1155-62; 1053-69).

While National and du Pont have followed each other's price reductions on their commercially comparable products, such price following has been competitive and not collusive, and has resulted in repeated, substantial reductions of the price of titanium pigments (R. 1167, 1066, 1072-3).

11. American Zirconium Agreements (1934-1944)

In or about 1934 American Zirconium Company, which was owned 50% by Glidden Company and 50% by Metal & Thermit Corporation, began to manufacture TiO_2. National notified Zirconium that it was probably infringing patents owned or controlled by National, and in consequence Zirconium requested and received from National a license under all United States patents owned or controlled by National (Exs. H, H1, H2, Vol. I, pp. 260-81). National and Zirconium each granted the other a non-exclusive license under its existing and future patents in the "licensed field"; Zirconium agreed to license National, its licensees or sublicensees, under any present or future foreign patents of Zirconium; and in other respects the agreement conformed with the requirements of Article XIV of the 1920 agreement between Pigment and Titan A/S. At the request of Zirconium, National accepted 10% of the common stock of Zirconium in lieu of royalties and thereupon designated a representative to serve on the Board of Directors of Zirconium (Ex. 356, Vol. II, p. 1308). National exchanged technical information with Zirconium, it gave Zirconium engineering assistance in connection with the installation and use of its processes, and it licensed Zirconium to use pulverizing machinery available to National and through National to du Pont (Ex. P2, Vol. I, pp. 446-54).

As a stockholder of Zirconium, National gave Zirconium such advice and assistance as might reasonably have been expected; but National lacked confidence in the management of Zirconium and from time to time endeavored to sell its Zirconium shares. Finally, in April 1944 the National-Zirconium agreement was cancelled, the parties exchanged releases, and National assigned its shares of Zirconium to Glidden (Finding 84, R. 62-3; Ex. NL 28, Vol. IV, pp. 3954-4060; R. 1081-1103).

12. Virginia Chemical Company (1937)

Some time prior to 1937 Virginia Chemical Company began the manufacture of TiO_2. Believing that Virginia Chemical was probably infringing its patents, National so notified Virginia Chemical, and in consequence there were several conferences attended by technical employees of the two companies to determine what infringements, if any, were taking place (Finding 85, R. 297). When it was determined by National that Virginia Chemical was in fact infringing, National offered Virginia Chemical a license under all its patents in the "licensed field" on a 2% royalty basis. This offer was refused, and no agreement of any sort has ever been made between National and Virginia Chemical, and no suit for infringement has been instituted by National (R. 904, 909).

13. Pulverizing Machinery Licenses (1939-1944)

In 1939 National undertook to adapt a patented machine known as the Micromizer Reduction Mill for use in the manufacture of titanium pigments. Following developments and changes by National, the machinery proved of substantial value as a means of improving the texture of

titanium pigments; and National secured an exclusive license, with the right to grant sublicenses, for titanium pigments manufacture, from the patentee, International Pulverizing Corporation. National licensed du Pont and Zirconium and was willing to license any other company which had licenses under its titanium pigments patents on identical terms with those National was required to pay the licensor. In October 1944 National relinquished its exclusive license and took in its place a non-exclusive license (Finding 81, R. 60-1; Ex. NL 31, Vol. IV, pp. 4073-6).

14. New York Ilmenite Mining Development (1941)

Owing to the impossibility of continuing to import ilmenite from India, in 1941 National opened up a domestic source in Essex County, New York. National was directed by Office of Production Management to, and did, offer participation in this project to each of the other producers of titanium pigments in the United States. The offer was accepted by du Pont. As a result of the investment of more than $10,000,000 by National, and its management, since about July 1942 there has been a domestic source of ilmenite which was sufficient for the demands of World War II. The directive of the Office of Production Management was approved by the Attorney General of the United States (Finding 36, R. 248; Ex. NL 28, Vol. IV, pp. 3991-4008; R. 1094-6).

Specification of Errors, Statement of Issues, and Summary of Argument

There are three appeals.

In No. 89 the Government assigns as error the refusal of the District Court (*a*) to require royalty-free licensing, (*b*) to require, at a reasonable charge, the furnishing of technical information relating to the methods or processes for manufacturing titanium pigments, (*c*) to require divestiture of at least one half of both National's and du Pont's domestic titanium plants and business, and (*d*) for certain other incidental relief (Assignment of Errors, R. 330-1).

In No. 90 National and Titan complain that the decree is too broad in certain respects (A. of E., Par's 1, 2, R. 336-8), and that the provision for divestiture of stock in certain foreign companies is unreasonable and unwarranted (A. of E., Par. 5, R. 338). They assign as error the provision for compulsory licensing of existing patents on a uniform, reasonable royalty basis (A. of E., Par. 3, R. 338).

In No. 91 du Pont assigns numerous errors which presumably will be discussed in its brief.

In order to submit a single, coordinated brief in opposition to parts of the Government's appeal and in support of other parts, as well as in support of the National and Titan defendants' appeal, three weeks before the case is called (Rule 27), when the Government's brief must also be submitted, and to obviate, or at least reduce the length of, reply briefs, we have endeavored to anticipate the Government's points and have arranged our brief accordingly.

We think the Government will contend that National and du Pont have used their patents in violation of the

Sherman Act and that they should therefore be compelled to license any applicant royalty-free under their existing patents and patent applications. We shall not oppose this contention, but on the contrary shall affirmatively support it.

We believe the Government will also contend that National and du Pont have so conspired in violation of the Sherman Act that divestiture of at least one of the titanium pigment plants of each is required to create competition in the titanium industry. In opposition to this we shall contend that competition now exists, and has always existed, between National and du Pont and that, if royalty-free licensing is required, any potential producer having the necessary capital can enter the industry without restraint or hindrance.

In support of our contention that the judgment is too broad in certain respects we shall demonstrate that the court erred in enjoining any new agreements containing any of the provisions of the cancelled agreements. If this provision prevails, National and Titan will be unable to enter into normal business arrangements.

As to the provision for divestiture of stock interest in certain foreign companies, we shall show that such divestiture will restrain trade rather than create a condition free from restraint.

We shall deal first with the issues now raised by our appeal (No. 90), then with a point made only on the Government's appeal (No. 89).

Argument

I

The District Court erred in enjoining the further performance of any of the provisions of the cancelled contracts and of any agreements amendatory thereof or supplemental thereto and enjoining normal and usual arrangements between the defendants and other producers of titanium products.

Paragraphs 5 and 6 of the judgment perpetually enjoin National and Titan from the further performance of *any* of the provisions of the cancelled contracts and of any agreements amendatory thereof or supplemental thereto, and also enjoin the making of any new agreement between these defendants and other producers of titanium products which has as its purpose or *effect* the continuing or renewing of any of the cancelled agreements (R. 310-13).

Paragraphs 5 and 6 should be amended by eliminating the language italicized below, as follows:

> "5. The following agreements are hereby adjudged to be unlawful under Section 1 of the Sherman Act and each of them is hereby cancelled *and the defendants and each of them and all persons acting or claiming to act through, for or under them and all successors and subsidiaries of any of the defendants are hereby enjoined and restrained from the further performance of any of the provisions of said agreements and of any agreements amendatory thereof or supplemental thereto:* [followed by a list of the cancelled agreements]"
>
> "6. Each of the defendants and each of their directors, officers, agents, employees, successors and sub-

sidiaries and all persons acting, or claiming to act under, through or for them or any of them are hereby enjoined and restrained (a) *from entering into, adhering to, maintaining or furthering, directly or indirectly, or claiming any rights under any contract, agreement, understanding, plan or program among themselves, the co-conspirators, or with any other person, partnership or corporation, which has as its purpose or effect the continuing or renewing of any of the agreements listed in paragraph 5 hereof;* (b) from entering into, adhering to, maintaining or furthering, directly or indirectly, any contract, agreement, undertaking, plan or program with any other producer or dealer relating to titanium pigments which has as its purpose or effect (1) to divide sales or manufacturing territories, (2) to allocate markets, (3) to limit or prevent United States imports or exports, (4) to grant to any third party any market as its exclusive territory, (5) to keep any third party out of any market; provided, however, that nothing contained in this subdivision (b) of this paragraph 6 shall prohibit any normal and usual arrangements between any defendant and its directors, officers, employees, agents, subsidiaries, or any PRODUCER, dealer or distributor, whether or not a co-conspirator; (c) from restricting any purchaser of titanium pigments in the use thereof."

Paragraph 6 should further be amended by adding to the proviso clause the word PRODUCER as indicated above.

Any rearrangement of stock ownership in the foreign companies—in fact, the very action compelled by paragraph 8 of the judgment (the disposition of National's stock in foreign companies, or the acquisition of the stock of others in such companies)—is necessarily amendatory of or supplemental to the cancelled agreements.

The District Court cancelled contractual relations between parties when, in most cases, only one of the parties was before the court and subject to its jurisdiction. It will be sufficiently difficult for National and Titan to adjust their relations with their foreign associates in any case without having their hands tied by a prohibition against any adjustment whatsoever. Titan should be free to negotiate reasonable settlements, provided the restraints contained in the cancelled agreements are not renewed or continued.

The assignment of patents, grants of licenses under patents not listed in the appendix to the judgment or defined in paragraph 4 thereof—in short, practically any action the defendants might naturally and properly take in the future would be prohibited by the unnecessary injunctions and restraints contained in paragraphs 5 and 6.

We recognize, as indeed we must, that the "United States is entitled to effective relief". *Local 167 et al.* v. *United States*, 291 U. S. 293, 299 (1934). The task before the court is that of

> ". . . fashioning a decree in an Anti-trust case in such way as to prevent future violations and eradicate existing evils, . . ." *Associated Press et al.* v. *United States*, 326 U. S. 1, 22 (1945).

The object is the creation of

> ". . . a new condition which shall be honestly in harmony with and not repugnant to the law." *United States* v. *American Tobacco Company*, 221 U. S. 106, 187 (1911).

To perform that task, the court is faced

> ". . . with the difficult problem of awarding an injunction which would insure the desired end without

imposing punishments or other sanctions . . ." *Hartford-Empire Co. et al.* v. *United States*, 323 U. S. 386, 408 (1945).

This problem has been described as

> "The determination of the terms of the judgment which will accomplish that which is necessary in the public interest and which will not deal unfairly with the defendants . . ." *United States* v. *Pullman Co. et al.*, 53 F. Supp. 908 (E. D. Pa. 1944).

In reversing the *American Tobacco* decree, the Supreme Court said:

> ". . . we leave the matter to the court below to work out a compliance with the law without unnecessary injury to the public or the rights of private property." (221 U. S. at 188)

The controlling considerations were expressed as follows (221 U. S. at 185):

> ". . . In considering the subject . . . three dominant influences must guide our action: 1. The duty of giving complete and efficacious effect to the prohibitions of the statute; 2, the accomplishing of this result with as little injury as possible to the interest of the general public; and, 3, a proper regard for the vast interests of private property which may have become vested in many persons as a result of the acquisition either by way of stock ownership or otherwise of interests in the stock or securities of the combination without any guilty knowledge or intent in any way to become actors or participants in the wrongs which we find to have inspired and dominated the combination from the beginning. . . ."

The courts have repeatedly emphasized that the problem of framing a proper decree is to be solved by the exercise

of a jurisdiction that is "remedial, not punitive" (*United States* v. *American Can Co. et al.*, 234 Fed. 1019 (1916)), and "is to be exercised according to the general principles which govern the granting of equitable relief" (*DeBeers Consolidated Mines, Ltd. et al.* v. *United States*, 325 U. S. 212, 218 (1945)). See *Appalachian Coals, Inc. et al.* v. *United States*, 288 U. S. 344, 377 (1933); *United States* v. *Corn Products Refining Co. et al.*, 234 Fed. 964, 1018 (1916).

These general statements are the reflection of three distinct doctrines:

First, as suggested by the extract from the old *American Tobacco* case, property interests of the defendants should be recognized and protected so far as may be consistent with the granting of effective relief;

Second, the court may not "issue a general injunction against all possible breaches of the law" (*Swift and Company* v. *United States*, 196 U. S. 375, 396 (1905)), and the corollary that an offender should not be placed in such position that it "ceases to be under the protection of the law of the land and must thereafter conduct all its business under the jeopardy of punishment for contempt for violating a general injunction" (*New York, New Haven and Hartford Railroad Company* v. *Interstate Commerce Commission*, 200 U. S. 361, 404 (1906), and see *E. W. Bliss Company* v. *United States*, 248 U. S. 37, 48 (1918)); and

Third, the court may not "create as to the defendants, new duties, prescription of which is the function of Congress" (*Hartford-Empire Co. et al.* v. *United States*, 323 U. S. 386, 409 (1945)).

The applicable principles were stated in the *Hartford-Empire* case as follows (323 U. S. at 409-10):

> "The Sherman Act provides criminal penalties for its violation, and authorizes the recovery of a penal sum in addition to damages in a civil suit by one injured by violation. It also authorizes an injunction to prevent continuing violations by those acting contrary to its proscriptions. The present suit is in the last named category and we may not impose penalties in the guise of preventing future violations. This is not to say that a decree need deal only with the exact type of acts found to have been committed or that the court should not, in framing its decree, resolve all doubts in favor of the Government, or may not prohibit acts which in another setting would be unobjectionable. But, even so, the court may not create, as to the defendants, new duties, prescription of which is the function of Congress, or place the defendants, for the future, 'in a different class than other people,' as the Government has suggested. The decree must not be 'so vague as to put the whole conduct of the defendants' business at the peril of a summons for contempt'; enjoin 'all possible breaches of the law'; or cause the defendants hereafter not 'to be under the protection of the law of the land.'"

Applying these principles to the instant case, it is submitted that cancellation of the agreements (Par. 5) and the injunction (Par. 6(b), (c)) against any continuation or renewal of the illegal provisions thereof (namely, division of sales or manufacturing territory, allocation of markets, limitation of imports or exports, restrictions on use, &c.) will insure complete, effective relief without subjecting the defendants to undue hardship and losses. Accordingly, it is submitted that the amendments requested on pages 52-3 above should be granted in the interest of promoting trade and competition in titanium pigments.

II

The court erred in refusing to order royalty-free licensing of all patents as defined in the judgment.

(On the Defendants' Appeal, No. 90)

Paragraph 7 of the judgment is as follows:

"7. Each of the defendants is ordered to grant to any applicant therefor, including any defendant or co-conspirator, a non-exclusive license under any or all of the patents as herein defined at a uniform, reasonable royalty. Such grant may, at the option of licensor, be conditioned upon the reciprocal grant of a license by the applicant, at a reasonable royalty, under any and all patents covering titanium pigments or their manufacture, now issued or pending, or issued within five years from the date of this decree, if any, owned or controlled by such applicant. Such license or reciprocal license may, at the option of either party, contain a provision for the inspection of the books and records of the licensee by an independent auditor who shall report to the licensor only the amount of royalty due and payable and no other information. During a period of three years from the date of this decree such license or reciprocal license may at the option of either party contain a provision for the imparting in writing, at a reasonable charge, by the licensor to the licensee, of the methods and processes used by the former at the date of the license in its commercial practice under the licensed patents in connection with the production of titanium pigments. The Court reserves jurisdiction to pass upon the reasonableness of any royalty or charge herein directed to be reasonable. Defendants are restrained from attempting to enforce any rights under any foreign patents owned by them or under which they are the exclusive licensees to prevent the exportation of

titanium pigments from the United States to any foreign country." (R. 313)

The expression, "patents as herein defined" means (Judgment, Par. 4) (*a*) the letters patent and patent applications listed in the appendix attached to the decree; (*b*) all divisions, continuations, or reissues of any of said patents and applications; (*c*) all patents issued upon such applications; (*d*) all patents which cover any titanium pigments or any process for the manufacture of titanium pigments issued to any of the defendants within five years from the date of the decree; all such patents which any of the defendants acquires within such five years; and all such patents of which any of the defendants becomes the exclusive licensee within such five years with power to sublicense (R. 310).

National has always been in favor of the widest possible use of patents and technical information consistent with Article XIV of the 1920 agreement. The District Court found that one of the purposes of the 1920 agreement was to utilize fully the patents and know-how of each of the parties and to promote the more rapid development of the business (Finding 46, R. 254). The parties to that agreement—Titanium Pigment Company (National) and Titan Company A/S (the Norwegian company)—were the only manufacturers of titanium pigments (R. 918-20; Finding 33, R. 245-7). Likewise, one of the purposes of the National-du Pont agreement of 1933 was to avoid the expenses and risks of patent litigation and to give each of the parties access to the other's patents and technical experience (Finding 79, R. 291-3).

National's position on royalty-free licensing was clearly stated during the conferences attended by the court and

counsel in connection with the framing of the judgment (R. 1227). It was and is National's position that, if the industry is to be freed completely of all restraints, the licensing of the patents involved must be completely unfettered and unrestricted (R. 1227-8).

This Court refused to approve royalty-free licensing in *Hartford-Empire Co. et al.* v. *United States*, 323 U. S. 386, 413-16 (1945). But each Sherman Act case depends on its own facts. *United States* v. *Union Pacific Railroad Company*, 226 U. S. 470, 474 (1913). A judgment should grant relief that is effective and adequate to the occasion. *Local 167 et al.* v. *United States*, 291 U. S. 293, 299 (1934); *United States* v. *Trans-Missouri Freight Association*, 166 U. S. 290, 308 (1897).

The *Hartford-Empire* case is distinguishable. Hartford-Empire is a patent holding and developing company. It does not manufacture glassware except for experimental purposes. Its income is derived from royalties and fees obtained from the licensing and leasing of its machinery. *United States* v. *Hartford-Empire Co. et al.*, 46 F. Supp. 541, 546 (N. D. Ohio 1942). Hartford-Empire does not compete with its licensees; the requirement for uniform, reasonable licensing of its patents puts every glass manufacturer who uses the patents on an equal footing.

National and du Pont, on the other hand, manufactured and sold 46.4% and 45.1% respectively of the pure TiO_2 produced in the United States in 1943 (Findings 3, 9, R. 236, 237); together they dominate and control the titanium pigment business in the United States (Finding 79, R.

291-3) to the exclusion of all actual or potential competition (Finding 95, R. 303-6). The court therefore held that

> ". . . plaintiff is entitled to a decree which will restore titanium to the system of free competition; the means of preventing such development must be destroyed and the power to prevent it must be shorn from those who, by combination, have acquired it." 63 F. Supp. at 532 (R. 222).

According to the District Court, domination and control resulted in large part from a proliferation of patents (Finding 79, R. 291-3) and from a monopoly of technical information relating to the manufacture and use of titanium pigments and certain apparatus and equipment necessary to such manufacture, to the exclusion and detriment of other producers engaged in the titanium pigment business in the United States (Finding 95, R. 303-6).

Thus National and du Pont not only compete with their licensees but dominate the titanium industry. A requirement of uniform, reasonable royalties in no way frees competition because, no matter what the royalty may be, *in this industry* a licensee required to pay more than its licensor will be at a competitive disadvantage.

A patent owner who uses his patent in restraint of trade can not enforce the patent against infringers, at least until the effect of the illegal restraint has been dissipated. *Morton Salt Co.* v. *G. S. Suppiger Co.*, 314 U. S. 488 (1942); *B. B. Chemical Co.* v. *Ellis et al.*, 314 U. S. 495 (1942); *Mercoid Corporation* v. *Mid-Continent Investment Co. et al.*, 320 U. S. 661 (1944); *Mercoid Corporation* v. *Minneapolis-Honeywell Regulator Co.*, 320 U. S. 680 (1944).

As was said by Judge LEAHY in *United States* v. *Vehicular Parking, Limited, et al.*, 61 F. Supp. 656, 658 (D. Del. 1945), refusing to grant defendants' request to vacate a paragraph in the decree enjoining infringement suits and suits for the collection of royalties on existing patents until the effects of the illegal conspiracy had been fully dissipated (though the paragraph was subsequently modified, by consent of the parties, to enjoin suits for past infringements and past royalties),

> "In this connection defendants must remember that when a patent owner uses his patent in violation of the anti-trust laws he cannot restrain infringement of it by others." (Citing the *Morton Salt, B. B. Chemical* and the *Mercoid* cases, *supra.*)

Compulsory licensing alone would not be enough to restore the industry to a healthy, competitive condition. If National and du Pont are permitted to receive royalties on their existing patents, they will still be in position to dominate the industry.

If it be argued that a patent right is in all respects subject to the same protection as other property, the answer is that all property rights are subject to regulation when the public interest requires it. *Barbier* v. *Connolly*, 113 U. S. 27, 31 (1885); *Lawton* v. *Steele*, 152 U. S. 133, 136 (1894). The Government possesses whatever power is "appropriate to the exercise of any attributes of sovereignty specifically granted to it by the Constitution." *United States* v. *Gaffney et al.*, 10 F. (2d) 695, 696 (C. C. A. 2d, 1926); *Nebbia* v. *New York*, 291 U. S. 502, 524 (1934). An impairment of property rights by the enforcement of a valid regulatory statute is not a taking of property in the constitutional sense. *Bedford* v. *United States*, 192

U. S. 217 (1904). This Court has long recognized that the limitations of the Fifth Amendment are irrelevant in respect to the deprivation of property rights resulting from enforcement of the Sherman Act. *United States* v. *Joint Traffic Association*, 171 U. S. 505, 571 (1898).

The District Court has deprived the defendants of their property by restraining them from enforcing any rights under their foreign patents to prevent the exportation of titanium pigments from the United States (last sentence, paragraph 8 of the judgment) (R. 314). This is, in effect, ordering royalty-free licensing under foreign patents owned by the defendants. If such a provision is valid and appropriate in relation to foreign patents, surely the court can compel royalty-free licensing under United States patents. Consistent with our position throughout, we did not, and do not now, object to this provision of paragraph 8.

We believe, however, that royalty-free licensing should be limited to patents as defined in the judgment and should be conditioned upon a reciprocal grant from the applicant under any titanium patents owned or controlled by the applicant. This is consistent with the position National and Titan have always taken in connection with patent licensing.

Under the judgment the defendants will be freed from the conditions imposed by Article XIV of the 1920 agreement and similar conditions of other cancelled agreements. The cancellation of the illegal agreements, plus the requirement of royalty-free licensing of patents as defined in the judgment, will create a condition honestly in harmony with the law.

III

The court erred in requiring National and Titan to dispose of their stock holdings in certain foreign companies or, in the alternative, to acquire the entire stock holdings of these companies.

(On the Defendants' Appeal, No. 90)

Statement of the Problem

Paragraph 8 of the judgment requires National and Titan, within one year from the date of the judgment, to present to the court a plan for divesting themselves of their stock holdings and other financial interests in BTP, CTP, TG, and TK, or for the purchase of the entire stock holdings and other financial interests in these companies (R. 314).

National owns 50% of TG, a German company, and 18.5% of TK, a Japanese company (NL Answer, R. 41; Finding 6, R. 236-7). Though the war has ended since the trial was concluded, there is still complete lack of information concerning the condition of these companies; their future is affected by all of the uncertainties attending the occupation, demilitarization, and eventual reconstruction of Germany and Japan.

At the time of the trial National owned 44% of BTP and 43% of CTP (Findings 6, 24, R. 236, 242). The stock of these companies was held subject to contractual obligations which imposed severe restrictions on sale. In both instances National, if forced to sell, was required to sell to the remaining stockholders at book value. Book value did not include any consideration of good will, patents, or future business possibilities (Exs. F, K, Vol. I, pp. 119, 242).

The basis of this case is the 1920 agreement between Titanium Pigment Company (National) and Titan Company A/S (the Norwegian company). National now owns 87% of the Norwegian company and has an option to purchase the remaining 13% (Finding 4, R. 236). The 1920 agreement, therefore, might have been terminated but for the fact that its terms had been carried over in part into contracts between National and its British partners and National and its Canadian partner, and the fact that in the British and Canadian agreements certain provisions had been conditioned on the 1920 contract (Exs. F, K, Vol. I, pp. 119, 242).

In order to eliminate the criticized features of the agreements, a new British agreement was drafted before the trial (Ex. NL 30, Vol. IV, pp. 4066-72), and a similar agreement was being negotiated with the Canadians (Ex. NL 1, Vol. IV, p. 3820).

Shortly after the trial BTP notified National that it was planning to expand its business and desired to issue additional A shares. Under the terms of the British agreement National (Titan) was entitled to participate in stock financing on a pro rata basis. In order to facilitate the expansion of BTP, and at the same time adjust its problems with the British partners, National entered into a new agreement,— the court and the Government having been advised of the situation at a conference arranged for that purpose,—as follows:

(*a*) If the judgment is modified to permit National to own stock in BTP, National will reduce its interest to 25% of the present A shares and subscribe to new A shares at that rate.

(*b*) If the judgment is affirmed, National will sell and the British partners will buy National's entire

interest in BTP at book value, book value to be determined on a basis slightly more advantageous to National than the old agreement provided.

The new agreement is the best that National can obtain from the British in view of the extreme obligations contained in the old agreement. The judgment in this case would be no defense in a suit by BTP to enforce the old agreement.

The conditions which the court held in violation of law were "the product of agreements" (Opinion R. 201). The uncontested provisions of the judgment will completely eliminate participation by the defendants in any such agreements. The injunctive provisions will remove every illegal restraint and prevent recurrence.

National has recently entered into an agreement to purchase all of the stock of CTP,—also with the knowledge of the District Court and the Government,—and therefore consideration of the relationship between National and CTP has been taken out of this case.

The Economic Setting

It is impossible to consider the problems presented by National's stock interest in BTP without discussion of the economic factors involved. In order fully to inform the trial court on this aspect of the case, we called an expert, Dr. Imrie de Vegh, whose testimony may be found at R. 1112-45. We also printed and introduced as an exhibit the full text of Dr. de Vegh's memorandum for counsel (R. 1177, Ex. 34, Vol. IV, pp. 4108-72). The following description of the economic facts with reference to which National had to do business in the British Empire is taken from the testimony and

memorandum referred to, supplemented by references to relevant developments subsequent to the trial.

By the late nineteenth century the combination movement had progressed considerably in England and was highly successful in a number of industries. Moreover, as the competitive advantages of large size became more apparent, and especially as the financial success of monopolies resulting from the combination of a few powerful firms became obvious, a large number of huge industrial mergers took place. The control of the market exercised by the merged enterprises was further strengthened in many cases by cartel agreements with the companies that remained outside (Ex. NL 34, Vol. IV, pp. 4114-15).

The First World War gave a powerful stimulus to the combination movement; the Ministry of Munitions and other government departments found it easier to deal with trade associations than with competing individual producers. Organized for the purpose of restricting competition and controlling prices, in America today these associations would be called cartels. The problems created by them became so serious that a Committee on Trusts was appointed near the end of the war. The committee filed a report in 1919 which described the wartime evolution of combines and trade associations and stated (Cd. 9236, H. M. Stationery Office, 1919, p. 11)—"Trade Associations and Combines are rapidly increasing in this country, and may within no distant period exercise a paramount control of all important branches of the British trade."

The report was unanimous, but the four "radical" members of the committee (Ernest Bevin, J. A. Hobson, W. H. Watkins, and Sidney Webb) submitted an addendum in

which they argued that it did not go far enough. They stated that the combination movement is "both inevitable and desirable".

While after the war the purposes of the wartime combinations disappeared, the institutional changes remained. The big companies continued to grow bigger; the small companies continued to strive for agreements with competitors and for mergers in order not to go under in the competitive struggle. This latter factor became of considerable importance after 1921, when England failed to recover from the post-war slump and chronic unemployment appeared for the first time as an identified malady of modern industry.

The transitional difficulties of the post-war period provided a powerful incentive for defensive measures on the part of industry. British industry realized that it was losing out in the international competitive race with the more modern industries of the United States, Germany, Japan, and even of the smaller European industrial countries like Belgium, Sweden, and Switzerland. The chronic unemployment of the 1920s, the failure of England to maintain her share in the world's export markets, the invasion of the British home market by foreign industries, all tended to foster combinations in British industry (see Ex. NL 34, Vol. IV, pp. 4121-4).

By 1926 the Liberal Party was thoroughly alarmed by the challenge to orthodox liberalism inherent in post-war developments. It appointed a committee to study the situation, including W. T. Layton, editor of *The Economist*, Lloyd George, H. D. Henderson, Philip Kerr (subsequently

Lord Lothian), J. M. Keynes, Sir Herbert Samuel, Sir John Simon, R. H. Brand, D. H. Robertson, Sir Josiah Stamp, and others less well known in the United States. These men constituted the intellectual leadership of the Liberal Party and, in a large measure, that of England. Their report was published after eighteen months of deliberations, entitled *Britain's Industrial Future being the Report of the Liberal Industrial Inquiry.* It commands great attention, reflecting the ideas of leading English liberals and academicians as to how much of the liberal ideology of the nineteenth century could be salvaged. Chapter VIII of the report is devoted to trusts and trade associations. The report states that

> ". . . this very proper objective [the protection of the public interest] is not to be secured in these days by mere attempts to restore the old conditions of competition, which often involve waste and effort, the uneconomic duplication of plant or equipment, and the impossibility of adopting the full advantages of large-scale production.
>
> "In modern conditions a tendency towards some degree of monopoly in an increasing number of industries is, in our opinion, inevitable and even, quite often, desirable in the interests of efficiency. It is, therefore, no longer useful to treat trusts, cartels, combinations, holding companies, and trade associations as inexpedient abnormalities in the economic system to be prevented, checked, and harried. The progression from purely private individualistic enterprises to the Public Concern is one of the endless gradations and intermediate stages. . . ." (pp. 92-3)

By the end of the decade British industry was among the leaders of the world-wide concentration movement. It exercised a tight control over its domestic and imperial markets. In addition to the growing complexity of in-

dustrial production, marketing, and trade, the tariff protection of key industries, which was enacted after the World War, considerably assisted trustification and cartelization. The McKenna Duties of 1915 and the Key Industries Duties of 1921 were the first breaches in the free-trade system of England, where the only duties previously known were a few levies raised for revenue (*e. g.* on tobacco). The profit possibilities to be derived from economic concentration were enhanced by the tariff, which raised the delivered price of potentially competitive imports.

The highly tolerant view British legislation and courts took with respect to restraints of trade, the narrowness of their interpretation of what was an unreasonable restraint, and their refusal to consider any but the most specific evidence, contributed to the development of highly restrictive practices throughout British industry. This meant that what would be considered competitive behavior in the United States was at a discount and would have tended to provoke violent retaliation by an entire industry against the aggressor enterprise. A tacit code of non-competitive industrial discipline was built up which was and is of the greatest effectiveness.

During the 1930s two major changes occurred, both of which propelled industry further in the direction of concentration and coordination. First was the adoption of protectionist foreign trade policies. England adopted a full-fledged protectionist tariff in 1932. At the Ottawa Conference in the same year, moreover, a system of Imperial preference was established which went far to guarantee the Imperial market for British manufactured products. Having become a protectionist country, England enabled a number of her industries, in which previously the

absence of a tariff enforced some measure of competition, to reduce their competitive activities.

The second major development was the growing conviction that cartels, trusts, and other forms of industrial agreements and mergers are helpful tools of British national policy. Compulsory cartelization was attempted in cotton spinning, coal, and steel, among others. The British Government took an active interest in the international steel cartel negotiations; it made tariff and quota protection of the industry conditional on rationalization and reorganization; it backed the numerous international commodity agreements that involved British Empire producers. The Sugar Industry Reorganization Act of 1936 enacted a compulsory merger of all beet sugar manufacturing companies.

With the German example before their eyes, British Government officials and corporation executives became increasingly aware of the advantages to the execution of national policies that could be derived from industrial combination. They saw that monopolistic agreements among raw materials producers were a very effective way to increase the total proceeds of exports, and the total revenues accruing therefrom, both to the producing interests and to the national economy as a whole. These considerations were powerful in the formation of raw materials cartels throughout the British Empire, such as the rubber cartel, the tin cartel, and numerous other agreements among British Empire producers. They also became aware of the advantages of regulating trade and payments relations between England and foreign nations on a comprehensive basis. Among the first of such English payments agreements was the one negotiated with Argentina in 1933, the so-called Roca-Runciman Agreement. There were a num-

ber of subsequent agreements before 1939. A whole network of them was put into operation quickly after the outbreak of the war.

At the time of the trial in January 1945, one could but guess at the post-war organization of British industry and of international trade and international investment in general. It seemed unlikely, however, that the official United States policy of destroying cartels and freeing international trade and payments from all restrictions other than tariffs would succeed.*

Events have surpassed the most pessimistic expectations.

The victory of the Labor Party and the adoption of socialism as the official economic policy of the British Government mean that in Great Britain at least the combination movement will not only not be retarded, but will be accelerated on all fronts, albeit under government supervision. State monopoly is replacing whatever competition there was in a number of basic industries. Wartime controls over industrial production, prices, and distribution, over international trade, over international raw materials production and prices, have by and large been maintained and continued as effective tools of British Government policy. Economic necessity was often given as an excuse, when excuses were felt necessary, but the economic necessities invoked seem likely to continue.

American negotiators have been able to use the bargaining power of the United States to obtain minor ideological concessions from Great Britain, both at Bretton Woods and subsequently in the Anglo-American loan negotiations

* For a summary of British statements on the subject, see Mason, *Controlling World Trade* (CED Research Study), New York, 1946, p. 40, footnote 1.

of 1945. Widespread British expressions of anxiety that acceptance of the American proposals spells the doom of a British full employment policy have led to the giving of speedy reassurances that Great Britain will not abandon controls until it is certain that they will not be needed. Again we are in the realm of guesswork as to when the British Government will consider such controls unnecessary. If it means to carry out the policy of full employment and nationalization of industries stated as its program, the chances are that relaxations will be minor and temporary, even though the former privately controlled cartels will in future be more strongly influenced by British Government policy than prior to World War II.

In most of the globe outside the United States freely competitive enterprise in the American sense does not exist today and is extremely unlikely to exist at any time in the predictable future. That this is so in Soviet Russia and all Russian satellite countries goes without saying. How soon freely competitive capitalist enterprise can be established in the former Axis countries, if ever, is an unanswerable question; but it is evident that no such development is conceivable for years to come. Similarly, there is no way to predict the eventual economic organization of China and India,

The French Empire, Spain, and most Latin American countries are conducting far flung experiments in the nationalization of industry and in controls over the non-nationalized segments. These experiments are aimed at various national purposes, most frequently at full and stable employment; occasionally they have other objectives. It is hard to find in these countries any trace of any willingness to establish or restore freely competitive enterprise, especially to open their markets to unrestricted

American competition, beyond the minimum lip service required to maintain good relations and in certain cases to obtain loans from the United States or from United States sponsored international institutions.

In November 1945 the State Department published tentative plans for an International Trade Organization. A preliminary conference was recently held in London. The final texts are not yet available in this country, but *The New York Times,* reporting on them on December 22, 1946, explicitly stated that "the basis of the United States Charter was lost". The newspaper report adds a cryptic statement to the effect that "it was replaced by a more realistic working principle: namely that the majority of the world's important trading nations are willing to collaborate for the freeing of international trade", whatever that may mean. It is possible, of course, that at some future date the defenders of free competition and price flexibility in international markets will stage a comeback. At present, however, the most elementary prerequisites of such a comeback seem to be lacking and there is no way of predicting how, when, or from what source, if ever, such a comeback can originate.

It appears that the ideological crusade to return to what the Department of Justice conceives as normalcy in international trade and investment has to date been fighting a sequence of disastrous rearguard actions. The concepts of the Department of Justice in respect of international economic affairs not only have not made any converts abroad, but cannot make any unless paid for by direct economic concessions on the part of the United States. The reason for this is that foreign countries have found controlled international trade and investments extremely helpful to national economic policy, in that

(a) they help to maximize the proceeds of exports and to minimize the costs of imports;

(*b*) they help to insulate internal economies of countries against sudden foreign exchange losses that would otherwise rise from a decline of exports or an increase of imports, and generally against economic fluctuations in other countries, often referred to in British literature as the "export of unemployment"; and

(*c*) they help to integrate foreign trade and investment in economic reconstruction and full employment policies that foreign nations are pursuing along entirely different lines of economic policy and economic thinking from those prevailing in the United States.

Let us disregard, however, the implications of the sweep of state socialism over the rest of the world and review, instead, the possible methods of operation of American companies abroad on the basis of the experience of the relatively capitalistic and competitive period between the first and second world wars.

An American company wishing to engage in foreign business is limited to three methods of operation: (*1*) exports, (*2*) imports, (*3*) production abroad. Production abroad may take place by wholly-owned subsidiaries, by partly owned foreign enterprises, or by licensing companies wholly owned by foreigners.

With respect to exports, foreign governments have used tariff increases, government subsidies, import licenses, and other means to force American exporters to build up manufacturing production within the foreign frontiers.

To the extent that American corporations are importers of foreign products, or processors of foreign raw

materials, their interest is to buy at the lowest possible price. To the extent that they are producers of products that are competitive with potential imports, their interest lies in having tariff protection and other legal means to reduce the threat of foreign competition. If territorial limitations were impossible, self-protection would prevent American corporations from licensing foreign corporations that have lower costs. This would hardly be in the interest of anyone.

American corporations can engage in production abroad directly by wholly-owned subsidiaries or by partly-owned foreign enterprise, or indirectly by licensing an enterprise wholly-owned by foreigners.

The American owner of a wholly-owned foreign subsidiary has been in an increasingly difficult position for the last fifteen or more years. The pressure to replace exports from the United States by local facilities was followed, when the local facilities were American owned, by a pressure to have the local facilities at least partly locally owned.

The wholly-owned American subsidiary is handicapped with respect to adaptation to local customs, tastes, sales methods. What is worse, it remains a "foreign" enterprise against which local interests can always stir prejudice. Examples abound of discriminatory action against such wholly-owned American subsidiaries abroad.

Partnership with local groups and royalty agreements based on patent licensing are the two ways of forming a community of interests with someone inside the fort. These are the only ways to stay in foreign business and avoid discrimination directed against "foreign" enterprise. Short of withdrawal from business abroad, they

are the only practicable alternatives to a policy of economic aggression from the outside by competitive exports or to a policy of economic aggression from the inside by wholly-owned subsidiaries. Foreign nations use every known means to resist these types of economic aggression. In such a fight the enterprise trying to invade foreign territory is always in a weak position. Especially in view of high American wage costs and of important steps that have been taken in recent years to teach American technology to foreign nations, it is hard to believe that we shall be able to maintain a major position in foreign markets without cooperation with local interests.

Barring trade based on open or concealed subsidies, the only further alternative to economic aggression or economic cooperation is a withdrawal from business abroad. Such an ostrich-like policy of economic isolationism not only would be costly in terms of lost sales and assets but would eventually show up in a slowing down of our technological and economic progress.

Lack of agreement regarding export markets would not only not necessarily result in increased total exports, it would be likely to result in less. Small local enterprises would spring up behind each new tariff wall, the costs of production would be higher, and prices to the consumer more erratic. This in turn might mean a failure of a new product to be developed properly and to reach the public in quantity, except after considerable delays.

The Authorities

We have outlined the economic problems affecting the British market in considerable detail because the sale of National's stock in BTP or, in the alternative, the purchase

of all of BTP's stock, is the principal problem which confronts us under paragraph 8 at this time. These same factors exist to a greater or lesser extent in all export markets.

The District Court refused to consider these factors, holding that this was a matter for Congress to consider and not for the courts (Opinion, R. 208).

The necessity of molding decrees in antitrust cases "to the exigencies of the particular case" has recently been emphasized by this Court. *United States* v. *Crescent Amusement Co.*, 323 U. S. 173, 185 (1944). Even more recently this Court said:

> ". . . A full exploration of facts is usually necessary in order properly to draw such a decree. . . ." *Associated Press et al.* v. *United States*, 326 U. S. 1, 22 (1945).

It is submitted that both the facts and the relevant authorities require the elimination of the District Court's drastic order of divestiture. No case has been found in which acquisition by an American company of stock in a foreign company engaged in the same business has been held an illegal restraint of foreign commerce. It is not conceivable that such an acquisition, standing by itself, would violate the Sherman Act. An American company surely may join with foreign companies in creating a foreign manufacturing concern without subjecting itself to a charge of antitrust violation.

The contrary view would cast doubt on the legality of the operations of every industrial concern which engages in production abroad through corporations organized under foreign law, unless the corporations are wholly-owned subsidiaries.

The courts have often said that the Sherman Act does not make unlawful normal commercial arrangements or methods of expansion. *Standard Oil Company of New Jersey et al.* v. *United States*, 221 U. S. 1, 62, 81 (1911); *United States* v. *American Tobacco Company*, 221 U. S. 106, 179 (1911); *United States* v. *Reading Co.*, 226 U. S. 324, 369 (1912); *United States* v. *United States Steel Corporation*, 251 U. S. 417 (1920).

Perhaps the best known statement on this subject is that in which the Supreme Court, in the old *American Tobacco* case, discussed the decision which it had just announced in the *Standard Oil* case. Mr. Chief Justice WHITE wrote:

> ". . . It was therefore pointed out that the statute did not forbid or restrain the power to make normal and usual contracts to further trade by resorting to all normal methods, whether by agreement or otherwise, to accomplish such purpose. . . ." (221 U. S. at 179)

In the *Steel* case, the dissenting judges, while voting for dissolution, recognized that

> ". . . it was not the purpose of the act to condemn normal and usual contracts to lawfully expand business and further legitimate trade. . . ." (251 U. S. at 461)

The "rule of reason" has been applied by the courts not only in determining the legality of contracts and combinations, but also in formulating the relief which should be decreed against those found to be illegal. The authorities to this effect are reviewed on pages 94 and 95 of this brief and need not be repeated here.

A striking analogy to the present case is found in *United States* v. *Great Lakes Towing Co. et al.*, 208 Fed. 733 (N. D. Ohio 1913), 217 Fed. 656 (1914), appeal dismissed 245 U. S. 675 (1917). The court there found that the defendant had illegally restrained trade and acquired a monopoly of the towing facilities in fourteen Great Lakes ports. Although the court at first expressed doubt as to the adequacy of an injunction without dissolution, it allowed the defendant to present a plan for the elimination of the offending practices (208 Fed. 733, 747). On the settlement of the decree, the court reached the conclusion that the continued existence and operation of the defendant "under proper and stringent injunctive regulations" would "give better assurance of free competition and better public service than is promised by a division of the towing company's properties among several new ownerships" (217 Fed. 656, 661). The court pointed out that the evil to be remedied was not the ownership by the Towing Company of the stocks and physical properties of the formerly independent companies. As in the present case, the gravamen of the offense consisted of extrinsic wrongful practices rather than stock acquisitions. Those practices were summarized in the following statement (217 Fed. at 659-60):

> ". . . The combination represented by the towing company violates the Sherman Act because it is a monopoly created by abnormal and unfair means, the most important of which are (a) the system of exclusive contracts by which vessel owners who employ throughout the entire season the towing company's tug and wrecking service, at all the ports covered by its tariffs (so far as the vessel owner had occasion for such service), receive a large discount from tariff rates, which is denied to all others; (b) the giving of special concessions, rebates, and discriminations to customers;

(c) the restraint of competition by means of operating contracts, by unnecessary conditions imposed upon sellers of towing properties to buyers of tugs from the towing company; and (d) unfair rate wars, all adopted or engaged in for the purpose of obtaining and effectuating monopolistic control. Unless for such means, purposes, and practices, the size alone of the combination, or the mere unification of the towing interests thereby brought about, would surely not justify putting the towing company entirely out of business."

The court's discussion of the alternative remedies available to it has significance in the present case. It said (217 Fed. at 660):

"Merely enjoining further operation by the towing company would injure, rather than benefit, the public by depriving it of the present service pending the reorganization of a new and sufficient service. A receivership, and operation thereunder, until competitive conditions should be restored, without utilizing the towing company's property, would amount to a partial and unnecessary confiscation. We are thus left practically to a choice of two remedies: First, selling the towing company's properties to purchasers dissociated from the officers, directors, and stockholders of the towing company, with the expectation that operations will be carried on under a number of separate and independent ownerships, each confined to a given port or group of ports, and by receivership insuring a continuance of service pending sale and the ability to deliver the towing company's properties upon sale; or, second, to permit continued operation by the towing company only upon complete elimination of the offensive practices under which its monopoly has been created and maintained, and the imposition of such injunctive restrictions as will keep the way open for full and free competition. The towing company is before the court

and subject to its injunctive processes, including punishment for disobedience thereto; and if we can impose upon that company prohibitions, susceptible of enforcement, which shall eliminate past abuses and remove obstacles to free competition, such course would provide the most effective relief available, and so would manifestly be for the public interest."

It was accordingly held that all the offending practices should be enjoined, and that receivership and sale would be resorted to only if the defendant did not consent to be bound by the plan embodied in the court's decree.

The *Great Lakes Towing* case was recently cited with approval in the concurring opinion of Mr. Justice DOUGLAS in *Associated Press et al.* v. *United States*, 326 U. S. 1. The method of approach adopted by the court in that case, and the principles which it announced, are supported in many other cases under the Act. See *United States* v. *Terminal Railroad Association of St. Louis*, 224 U. S. 383 (1912); *United States* v. *Keystone Watch Case Co. et al.*, 218 Fed. 502 (E. D. Pa. 1915), appeal dismissed 257 U. S. 664 (1921); *United States* v. *American Can Co. et al.*, 230 Fed. 859 (D. Md. 1916), 234 Fed. 1019, appeal dismissed 256 U. S. 706 (1921); *American Press Ass'n et al.* v. *United States et al.*, 245 Fed. 91 (C. C. A. 7th, 1917).

In *United States* v. *American Can Co. et al.*, 234 Fed. 1019 (D. Md. 1916), the court denied dissolution of a combination which it found to have been formed illegally, although that was the only relief which the Government requested. After expressing the opinion that a decree for dissolution seemed "both unnecessary and unwise," the

court expressly rejected the argument that it was required to grant that relief. It wrote (234 Fed. at 1021):

> ". . . The insistence that the court has no choice in the matter assumes that equitable modes of relief are fixed and rigid. That is not so. The glory of chancery has always been that it could mold its remedies to meet the conditions with which it has to deal. In this case it appears probable that all potential restraints upon free competition now imposed by the size and power of defendant will pass away as speedily without as with dissolution, and that dissolution will cause far more loss and business disturbance than will attend the gradual re-establishment of competitive conditions by the play of economic forces. If so, no dissolution should now be decreed."

Similarly here, compulsory licensing will remove the restraints on potential competition in the United States and the abrogation of the cartel agreements will give free play to the economic forces at work in the foreign field.

Conclusion

The need for caution is accentuated by the fact that this is a case of first impression considered at the moment of greatest uncertainty in the field of international trade. Nobody can assert with any assurance that the compulsory divestiture of stock holdings will in fact stimulate foreign trade. We do know that the proposed order would cause National Lead incalculable loss and would place all the stock of the foreign companies in the hands of persons not subject to the jurisdiction of our courts.

The objections to foreign stock ownership, as we see it, are two-fold: *First*, the stock holdings were improperly

used to implement the cartel agreements. *Second*, the stock holdings by themselves, even upon the "dissolution" of the cartel, will restrain foreign commerce. The first objection is fully met by the abrogation of the cartel agreements and the injunction against their revival. The second must be considered in the light of the conditions now existing in the foreign field. The foreign companies will be free to enter the American market under the provisions of the decree which are not challenged. Like everyone else, they may obtain licenses under all existing American patents. The present tariff may serve as a deterrent, but defendants cannot be held accountable for that. Defendants are inhibited by the decree from using their stock ownership to bring about a renewal of the cartel or to enter into any understandings with the foreign companies by which they will stay out of the domestic market. If any such use be made, defendants will be in violation of the decree and subject to punishment for contempt. The divestment of the stock will not prevent a revival of the cartel if it be assumed that defendants would be foolish enough to violate the decree; their continued ownership of the stock will by itself result in no curb on imports without a supplemental agreement in violation of the decree. The Court will recognize that conspirators do not need stock to revive their unlawful arrangements, were they so minded. And stock will not serve as a screen to conceal any illicit understandings.

The injunction is the only effective means of preventing new arrangements for the division of international markets. The hypothetical and non-existent gains of divestiture are more than offset by the actual and incalculable loss which it would produce.

So far as exports are concerned, the inescapable fact which cannot be blinked is that the patents in the foreign countries are owned by companies not subject to the court's jurisdiction. Until these patents expire, defendants will be doing business abroad under pain of suits for patent infringement. Continued stock ownership will add no serious deterrent to foreign expansion. It is the principal means by which the defendants can do any business abroad. Divestiture is thus no real remedy, realistically considered. It is on the facts of this record wholly punitive and destructive of valuable property. We thus fail to see in what way this drastic proposal can promote the public interest.

An equity decree is an experiment in industrial regulation. (Cf. *Appalachian Coals, Inc. et al.* v. *United States*, 288 U. S. 344 (1933).) If the decree in practice proves ineffective, it can always be strengthened. Even if the facts and the law supported divestiture—which we stoutly claim they do not—the current uncertainty in the foreign fields should in itself compel the rejection of paragraph 8 of the judgment. Divestiture would be warranted only as a last resort under the compulsion of imperative and irresistible need after all other remedies have been tried and found wanting. No such showing can be made now and we are confident no need will exist in the future.

IV

The court correctly refused to order divestiture of all or part of the domestic titanium plants and business of National and du Pont.

(On the Government's Appeal, No. 89)

The suggestion that the defendants should be divested of their titanium plants and business, including technical and research personnel, was contained in the Government's proposed decree (Par. 9, R. 178-80) submitted by letter to the court dated September 14, 1945 (R. 1176), long after the case had been decided (July 5, 1945, R. 222). The point was then fully briefed and argued (R. 1176, 1197-1286).

The prayer for relief in the complaint contained no indication that such relief would be requested (R. 39-40). The only statement in the record on this subject appears at R. 368, where Government counsel in his opening statement said:

> "We also may ask the Court to consider the possibility of compulsory licensing of future patents for a limited time at a reasonable royalty and the possible divestiture of some of the manufacturing units of the defendants in this country."

Nevertheless the District Court spent the better part of two days on this question when the final decree was under discussion (R. 1197-1286) and concluded that no domestic divestiture should be required—not for lack of power in the court to require it, "*but as an act of discretion*" (R. 1286). The Government's entire argument for such relief was a plea to the court to exercise its discretion (R. 1206-7, 1208, 1212), and it was so understood by the defendants (R. 1229).

The Government has now assigned as error the failure of the court to require National to submit a plan for transferring to a new corporation, to be created by National, *one* of its two titanium pigment plants and all physical property customarily used in connection therewith, and for the sale of the stock of the new corporation to a person or persons other than the defendants and co-conspirators (R. 330).

This Court said in *United States* v. *Crescent Amusement Co. et al.*, 323 U. S. 173, 185 (1944):

> ". . . We recognize however that there is a wide range of discretion in the District Court to mould the decree to the exigencies of the particular case; and where the findings of violations are sustained, we will not direct a recasting of the decree except on a showing of abuse of discretion. . . ."

And Mr. Justice RUTLEDGE, in his dissenting opinion in *Hartford-Empire Co. et al.* v. *United States*, 323 U. S. 386, 441 (1945), said:

> "Shortly, in my view it is not this Court's business to fashion or rewrite the decree. . . . The reasons which thus ordinarily restrict the scope of appellate review have magnified force in anti-trust proceedings. Their complex character usually requires, as in this case, months or years for the trial court's consideration. With its maximum attention, this Court cannot possibly attain the same detailed familiarity with the cause. Nor can it frame at long distance, with the same assurance, a decree adequate for the necessity."

Probably nothing can demonstrate more conclusively the unwarranted character of this proposal than the fact that National's ownership of two titanium plants is not even mentioned in the findings or the opinion of the court. In fact, during discussion on the decree, after the trial, the

court did not know how many titanium plants National owned (R. 1267).

The legality under the antitrust laws of National's American titanium holdings was never put in issue and is entirely extraneous to the issues which were litigated. The attempt is made to punish for extrinsic violations by compelling a disposal of property, the ownership of which is fully in harmony with the requirements of the antitrust laws.

The District Court found that National is the largest and du Pont the second largest manufacturer of titanium pigments in the United States (R. 236-7). In 1943 National manufactured and sold 46.4% and du Pont 45.1% of the pure TiO_2 produced in the United States.

It also found that one effect of the 1933 agreement between them was to give them "together domination and control over the titanium pigment business in the U. S." (R. 292); and that "the agreements and understandings entered into between the defendants and the other corporations" had as one of their necessary effects the control and domination by these two companies of the manufacture and sale of titanium pigments in the United States to the exclusion of all actual or potential competition (R. 304-5).

The agreements referred to in the two latter findings, however, are those which have been cancelled by the provisions of the decree to which no exception is now taken by these defendants. That the original entry of National into the titanium business was lawful is unquestioned. Nor has there been any attack upon the method by which it acquired any of its United States property. The Court found that National and du Pont actively compete for customers; that there is no allocation of territory or

customers between them; that each maintains a large, highly trained technical sales force engaged in endeavoring to sell titanium pigments; that the buyers of titanium pigments are mainly well-informed, experienced purchasing agents; and that the production of titanium pigments has steadily increased in volume at a steadily declining price to the customer (R. 290, 207). Accordingly, the Government's position, put in its strongest light, must come down to this: That two companies, doing approximately the same volume of business, which are actively engaged in competition, can be required to dispose of all properties used in the business solely because of their past participation in an international cartel and patent pool. This is contrary to all authorities and is repugnant on every consideration of fairness and justice.

> ". . . Dissolution is not a penalty but a remedy; if the industry will not need it for its protection, it will be a disservice to break up an aggregation which has for so long demonstrated its efficiency. . . ." *United States* v. *Aluminum Co. of America et al.*, 148 F. (2d) 416, 446 (1945).

Dissolution in this case would not be remedial of any wrongdoing committed by defendants; it would be completely punitive; it would break up a business which has long demonstrated its efficiency, thus rendering a disservice to the public as well as to National, its stockholders and employees.

The rationale of the use of dissolution to break up an unlawful combination in appropriate cases finds its classic statement in the decision of this Court in the *Standard Oil* case:

> "It may be conceded that ordinarily where it was found that acts had been done in violation of the stat-

ute, adequate measure of relief would result from restraining the doing of such acts in the future. *Swift v. United States*, 196 U. S. 375. But in a case like this, where the condition which has been brought about in violation of the statute, in and of itself, is not only a continued attempt to monopolize, but also a monopolization, the duty to enforce the statute requires the application of broader and more controlling remedies. As penalties which are not authorized by law may not be inflicted by judicial authority, it follows that to meet the situation with which we are confronted the application of two remedies two-fold in character becomes essential: 1st. To forbid the doing in the future of acts like those which we have found to have been done in the past which would be violative of the statute. 2d. The exertion of such measure of relief as will effectually dissolve the combination found to exist in violation of the statute, and thus neutralize the extension and continually operating force which the possession of the power unlawfully obtained has brought and will continue to bring about."

The Court goes on to admonish that

> "In applying remedies for this purpose, however, the fact must not be overlooked that injury to the public by the prevention of an undue restraint on, or the monopolization of trade or commerce is the foundation upon which the prohibitions of the statute rest, and moreover that one of the fundamental purposes of the statute is to protect, not to destroy, rights of property." (221 U. S. 77-78)

In every adjudicated case in which dissolution of a going business has been ordered there was an unlawful integration or fusion of separate business units. In no case has divestiture of property been ordered where there was no such fusion or where the violation of the antitrust laws consisted of agreements or activities of legally independent busi-

nesses. In every case the unlawful fusions were brought about by some unlawful acquisitions. The issue litigated in every case was the legality of the integration. Thus in *Northern Securities Company* v. *United States*, 193 U. S. 197 (1904), it was held that the formation of the holding company ordered dissolved had "the direct and necessary effect . . . to restrain and monopolize interstate commerce by suppressing or . . . 'smothering' competition between the lines of two railway carriers" (193 U. S. at 354). The same is true of the other railroad cases. *United States* v. *Union Pacific Railroad Company*, 226 U. S. 61 (1912); *United States* v. *Southern Pacific Company et al.*, 259 U. S. 214 (1922). In the former case, the Court ruled "that a combination which places railroads engaged in interstate commerce in such relation as to create a single dominating control in one corporation, whereby natural and existing competition in interstate commerce is unduly restricted or suppressed, is within the condemnation of the act" (226 U. S. at 85).

The *Standard Oil* and *American Tobacco* cases rest on the illegality of the acquisitions by which the oil and tobacco monopolies were created. Both litigations involved numerous property and stock acquisitions, and flagrant violations of both Sections 1 and 2 of the Sherman Act were expressly found (221 U. S. 1, 45, 74; 221 U. S. 106, 142, 184). The anthracite coal cases are equally clear on this point. *United States* v. *Reading Company et al.*, 253 U. S. 26 (1920); *United States* v. *Lehigh Valley Railroad Company et al.*, 254 U. S. 255 (1920).

The cases which did not reach the Supreme Court are no different. Dissolution was ordered in *United States* v. *E. I. du Pont de Nemours & Co. et al.*, 188 Fed. 127 (C. C. Del., 1911); *United States* v. *Eastman Kodak Co. et al.*, 226

Fed. 62 (W. D. N. Y. 1915), 230 Fed. 522 (1916); *United States* v. *Corn Products Refining Co. et al.*, 234 Fed. 964 (S. D. N. Y. 1916), appeal dismissed 249 U. S. 621 (1919).

In the *du Pont* case, the court found that the defendant was the successor to a trade association which had fixed prices; that this illegal combination "had been so completely transmuted into a corporate form that the trade association was no longer necessary" (188 Fed. at 152). In the *Eastman Kodak* case, the court found that one of the methods by which the defendant had procured a monopoly was "the acquisition of competing plants, businesses, and stockhouses, accompanied by covenants restraining the vendors from re-entering the business" (226 Fed. at 80). In the *Corn Products* case, the court found that over a period of years four different fusions had been effected with the purpose of monopolizing the business; and that each time predatory practices had been used in an effort to maintain the monopoly.

That the creation of the close-knit combination or fusion (as distinguished from a loose-knit confederation or agreement) was itself a violation of the statute in all of these cases, was recently pointed out by this Court in *United States* v. *Crescent Amusement Co. et al.*, 323 U. S. 173, 189 (1944), this Court said:

> "The Court has quite consistently recognized in this type of Sherman Act case that the government should not be confined to an injunction against further violations. Dissolution of the combination will be ordered where the creation of the combination is itself the violation. See *Northern Securities Co.* v. *United States*, 193 U. S. 197, 354-360; *Standard Oil Co.* v. *United States, supra; United States* v. *American Tobacco Co., supra*, pp. 186-188; *United States* v. *Union*

Pacific R. Co., 226 U. S. 61, 97; *United States* v. *Reading Co.*, 253 U. S. 26, 63; *United States* v. *Lehigh Valley R. Co.*, 254 U. S. 255; *United States* v. *Southern Pacific Co.*, 259 U. S. 214; *United States* v. *Corn Products Refining Co.*, 234 F. 964, 1018. Those who violate the Act may not reap the benefits of their violations and avoid an undoing of their unlawful project on the plea of hardship or inconvenience. That principle is adequate here to justify divestiture of all interest in some of the affiliates since their acquisition was part of the fruits of the conspiracy. But the relief need not, and under these facts should not, be so restricted. The fact that the companies were affiliated induced joint action and agreement. Common control was one of the instruments in bringing about unity of purpose and unity of action and in making the conspiracy effective. If that affiliation continues, there will be tempting opportunity for these exhibitors to continue to act in combination against the independents. The proclivity in the past to use that affiliation for an unlawful end warrants effective assurance that no such opportunity will be available in the future. Hence we do not think the District Court abused its discretion in failing to limit the relief to an injunction against future violations. . . .

The divestiture ordered related to the affiliation of various chains of theatres; the chains themselves were not broken up and the defendants were not expelled by the decree from the business of exhibiting motion pictures.

The *Crescent* case, as the foregoing quotation shows, creates no exception to the proposition that divestitures have been ordered only in cases where there have been unlawful acquisitions. The refusal of this Court in that case to require the District Court to distinguish between the lawful and the unlawful acquisitions does not make the case different from the *Standard Oil* or the *American*

Tobacco cases, in each of which there had undoubtedly been acquisitions of particular units that would not have been unlawful if separately considered. The use of unlawful acquisition of a competing business as one of the methods of accomplishing an unlawful result has led the courts, in the cases which have been cited, to decree dissolution of the resulting illegal entity. In no case where that element was lacking has dissolution ever been ordered.

The authorities establish, furthermore, that even in the cases where the business has been unlawfully assembled, so that dissolution may be an appropriate remedy, it is far from a necessary one. Dissolution thus was denied in *United States* v. *Terminal Railroad Association of St. Louis*, 224 U. S. 383 (1912). It was also denied in the *Hartford-Empire* case by the District Court, 46 F. Supp. 541. This determination was affirmed, 323 U. S. 386, 408.

> ". . . Separation is not an end in itself; it is a means to provide an open market. . . ." *United States* v. *Pullman Co. et al.*, 53 F. Supp. 908 (E. D. Pa. 1944).

In *United States* v. *Great Lakes Towing Co. et al.*, 217 Fed. 656 (N. D. Ohio 1914), 658, the court said:

> ". . . While the power to dissolve an unlawful combination clearly exists, and should be exercised when necessary to give complete relief, the legislative policy, as disclosed by the terms of the act, is clearly to resort to restraint rather than to dissolution, except where restraint alone is inadequate."

Likewise, in *United States* v. *American Can Co. et al.*, 230 Fed. 859 (D. Md. 1916), the court found that the defendant, which had acquired approximately 50% of the tin can industry, was organized to monopolize the manufacture of cans and that predatory practices had been indulged.

The only relief which the Government sought was dissolution of the company, and that was denied (234 Fed. 1019). In his opinion on the scope of relief, Rose, *J.*, stated (234 Fed. at 1019-20):

> ". . . Jurisdiction of a court of equity is remedial, not punitive. A dissolution may not be decreed, unless there is reason to believe that more good than harm will come of it. . . . It is the duty of the courts to give effect to the legislative will, but it is equally their duty so to shape their decrees as to bring about the result desired by Congress with the least possible waste of anybody's time or of anybody's money."

See *United States* v. *Keystone Watch Case Co.*, 218 Fed. 502, 519 (E. D. Pa. 1915).

It has been shown that dissolution is a remedy that has been worked out by the courts to sever aggregations that should never have been formed, to correct conditions brought about by an ownership which is in itself unlawful. The foregoing cases show that, even in such cases it is a form of relief that is used sparingly and only when necessary. We have shown, too, that this is not such a case, and that the legality of defendants' acquisition and ownership of its American plants was not challenged by the plaintiff or considered by the court. It follows that the suggestion that this defendant be required to dispose of one of its domestic plants is wholly unwarranted.

The authorities plainly show that the plaintiff could not have succeeded had it litigated the lawfulness of defendant's ownership of its business. The cases heretofore considered are those in which illegal acquisitions were found to have occurred and unlawful practices indulged. That National Lead's position in the industry is in har-

mony with the antitrust laws is demonstrated by the cases upholding close-knit combinations whose power, position, and practices were not deemed objectionable. *United States* v. *United States Steel Corporation et al.*, 251 U. S. 417 (1920); *United States* v. *International Harvester Company et al.*, 274 U. S. 693 (1927); *United States* v. *Keystone Watch Case Co. et al.*, 218 Fed. 502 (E. D. Pa. 1915), appeal dismissed 257 U. S. 664 (1921); *United States* v. *Quaker Oats Co. et al.*, 232 Fed. 499 (N. D. Ill. 1916), appeal dismissed 253 U. S. 499 (1920).

In each of these cases the percentage of its industry which the defendant possessed was greater than that of National Lead in the domestic titanium market. The Steel Corporation controlled approximately 50% of the industry. International Harvester controlled 64% of its industry when the Supreme Court held that the plan of dissolution under a consent decree had brought about "a new situation in harmony with law." In the *Keystone Watch* case the percentage was estimated from 42 to 47%, slightly less or slightly more than National Lead's proportion of the titanium business. Quaker Oats, by buying out a competitor, achieved up to 70 to 75% of the rolled oats production in the country. In each of these cases it was found that control of the market was not secured; there was actual competition which prevented the defendant from dominating the industry.

In the present case, the court has found that in 1943 National Lead produced 46.4% and du Pont 45.1% of the pure TiO_2 produced in the United States (R. 236, 237). The genuineness and vigor of the competition between them is established by detailed findings (R. 290-1). The court has found, however, that *between them* they control and dominate the market. This obviously means control and domi-

nation when they combine or join an existing combination such as the cartel. When the element of combination is eliminated—as it has been by the injunctive provisions of the decree—there is no such control or domination. This is manifestly sound. Neither defendant has attained or could attain that degree of control over the market which is required before a violation can be found. The situation is strikingly similar to that in the *Steel* case, where it was pointed out that the defendant could influence prices only by securing joint action with its competitors. These efforts at such joint action were found to have been abandoned. Here the only joint action of which there is any evidence—the pooling of patents—is removed by the injunction. The injunctive paragraphs of the judgment constitute a "dissolution" of the only illegal combination shown to have existed with reference to the domestic market and, if this Court orders royalty-free licensing, as we strongly urge, there can be no possible basis for domestic divestiture.

The present case, of course, presents no issue similar to that in *United States* v. *Pullman Co. et al.*, 50 F. Supp. 123, 53 F. Supp. 908 (E. D. Pa. 1944). The nature of the other lines handled by National was not the subject of inquiry at the trial; no evidence was offered to show that National's position in other fields was used to suppress competition in titanium or *vice versa*. National is no monopoly in any of the fields in which it operates, and the expansion of its business has been both normal and natural. In other cases in which dissolution was ordered there were not only unlawful acquisitions, but the resulting fusion over-shadowed and dominated the industry. In no case has dissolution been required of a company whose position in its industry—its power and conduct—was at all comparable to those of National.

In the *Aluminum* case, in discussing the proper method of computing the proportion of the industry controlled by the defendant, Judge HAND wrote (148 F. (2d) at 424):

> ". . . The percentage we have already mentioned—over ninety—results only if we both include all 'Alcoa's' production and exclude 'secondary'. That percentage is enough to constitute a monopoly; it is doubtful whether sixty or sixty-four percent would be enough; and certainly thirty-three per cent is not."

We have not discussed the many questions of fact and considerations of business and public policy that would have to be explored if the matter of dissolution had been raised at the trial and were properly in issue here. We have not discussed its effect upon all those dependent upon this industry—customers, ultimate consumers, stockholders, and employees. Nor have we called attention to the unfeasibility of the proposed separation of National's titanium business into two segments. Attention need only be called to the fact that one of the two plants produces pure TiO_2 exclusively, and the other composite pigments; the separation on the basis of plants, without more, would be more of a vertical than a horizontal severance and would not produce two competing enterprises.

Compare *United States* v. *Winslow*, 227 U. S. 202 (1913),

United States v. *United Shoe Machinery Company of New Jersey et al.*, 247 U. S. 32 (1918).

Many similar cogent arguments of commercial expediency could be presented if this case had turned upon the validity of National's ownership of the titanium branch of its business. We can see no useful purpose in burdening this Court with such arguments when dissolution is utterly extraneous and without legal foundation, is contrary to all authority, and is obviously punitive in character.

Conclusion

The judgment should be modified as follows:

Paragraphs 5 and 6 should be modified to eliminate the injunction against normal and usual business arrangements.

Paragraph 7 should be modified to require royalty-free licensing.

Paragraph 8 should be eliminated.

In all other respects the judgment should be affirmed.

Respectfully submitted,

BETHUEL M. WEBSTER,
Counsel for NATIONAL LEAD COMPANY
AND TITAN COMPANY, INC.

CLIFTON P. WILLIAMSON,
EDWARD L. REA,
CAROLINDA WATERS,
Of Counsel

No. 89

THE UNITED STATES OF AMERICA,
Appellant,

v.

NATIONAL LEAD COMPANY, TITAN COMPANY, INC., and E. I. DU PONT DE NEMOURS AND COMPANY,
Appellees.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE SOUTHERN DISTRICT OF NEW YORK

APPELLEE DU PONT'S BRIEF

WM. DWIGHT WHITNEY,
Counsel for Appellee E. I. du Pont de Nemours and Company,
15 Broad Street,
New York, N. Y.

GERHARD A. GESELL,
JOHN LOGAN O'DONNELL,
NESTOR SHEA FOLEY,
OSCAR A. PROVOST,
JOHN HANCOCK,
Of Counsel.

January, 1947.

	PAGE
DU PONT'S POSITION AS TO THE DECREE, ASSUMING AFFIRMANCE ON THE MERITS	1
(a) Past Infringement	3
(b) Future Patents	4
(c) Present Patents	5
COMMENT ON THE GOVERNMENT'S HANDLING OF THE FACTS	6
POINT I. The Relief Granted by the District Court Was More Than Adequate. Indeed, the Relief Should be Limited to An Injunction	8
POINT II. The Court Is Without Power to Order Royalty-free Licensing	13
(1) Royalty-free Licensing Would Be Inconsistent with the Decisions of this Court	13
(2) Royalty-free Licensing Would Be Inconsistent with Legislative History Since the *Hartford-Empire* case	18
POINT III. Royalty-free Licensing Is Inappropriate in This Case	20
(1) Competition Will Flourish Under Reasonable Royalty Licensing	20
(2) There Are No Unduly Onerous Administrative Obligations Placed Upon the Courts by Reasonable Royalty Licensing	23
(3) Royalty-free Licensing Favors National Lead	33

PAGE

POINT IV. There Is No Policy in the Patent Law or Anti-trust Law Requiring that du Pont's Patents Be Rendered Unenforceable for their Remaining Terms 38

(1) The *Morton Salt* Doctrine Is Inapposite..... 38

(2) Du Pont Has Scrupulously Exercised Its Patent Rights Within the Lawful Limits of the Authorized Grant 41

POINT V. If Compulsory Licensing Is Ordered, du Pont Is Entitled to a Reciprocal License from its Licensees 45

POINT VI. There Is No Possible Warrant for an Order of Divestiture of Plants. The Whole Subject Was Thoroughly Considered by the District Court, Which Exercised Its Discretion Based On Knowledge of the Record and Awareness Both of the Legal Authorities and the Economic Theories Involved 50

(1) The Facts 52

(2) The Legal and Economic Principles..... 56

APPELLEE DU PONT'S BRIEF

DU PONT'S POSITION AS TO THE DECREE, ASSUMING AFFIRMANCE ON THE MERITS.

The first sentence of the government's "ARGUMENT" in its brief in No. 89 (47)[1] gives its theory of "The Function of an Antitrust Judgment" as follows:

> "Each case under the Sherman Act stands upon its own facts and the judgment must be moulded to the exigencies of the particular case".

We unreservedly accept this. But the short answer to all of the arguments in the government brief is that the government had no sooner stated this correct rule than it abandoned it, for all the rest of the government brief consists of advocacy of what it calls "general principles" (e. g. 49) which it soon becomes evident that the government would apply to *any* anti-trust case involving patents. We shall, on the other hand, discuss the relief appropriate to the facts in *this* case and to the traditional objectives of an anti-trust decree.

Du Pont's position is this:

(1) The decision against it should be reversed on the merits. (This is argued in du Pont's original brief in No. 91, and we need not repeat the arguments here.) We submit, however, that even if our appeal in No. 91 be denied, we have at least shown that du Pont's record in respect of titanium patents has been so beneficial to competition and lacking in harm to consumers that that must be taken into consideration in framing the decree.

---

[1]Reference numbers in parentheses are to the pages of the government brief.

(2) As the *Hartford-Empire* case, 323 U. S. 386, was decided only two years ago, and no *new* reasons have arisen to support its being overruled, it should now be sustained. The government's principal argument is that it is impossible ("unworkable") for Courts to determine the reasonableness of a royalty; but the one *new* event that has arisen since the *Hartford-Empire* case is that Congress has expressly enacted that the Courts *shall* in a proper case determine what is "a reasonable royalty", Public L. 587, 79th Cong., 2d Sess., approved August 1, 1946. Indeed, this is declaratory of what has always been the rule, *viz.*, that courts may determine a reasonable royalty in patent infringement suits. *Dowagiac Manufacturing Company* v. *Minnesota Moline Plow Company*, 235 U. S. 641, 648. See also *The Suffolk Company* v. *Hayden*, 70 U. S. 315, 320. To conform the relief in this case to that in the *Hartford-Empire* case, the decree below would be affirmed, except for the modification of striking out the compulsory disclosure of technical information (considered in Part Two of du Pont's brief in No. 91).

(3) Assuming *arguendo* that this Court should now determine that it wishes to overrule the *Hartford-Empire* case, and to hold that there is power in the Court to order royalty-free licensing, then du Pont submits

(a) That at least this should not apply to future patents. [Indeed, the government does not even ask it in respect of future patents.]

(b) Nor should it apply in du Pont's situation even to existing patents, as there is no reason why the fact that the Court elects to terminate the system of judicial supervision of the reasonableness of royalties should result in its adopting the extreme concept of confisca-

tion. At least in a case so favorable on the facts as the present, the Court should exercise its discretion to confine relief to what has been called the relief "ordinarily" applicable in anti-trust cases: issuance of an injunction.

Du Pont's position may be illustrated and expanded by reference to three different types of patent claims: past, present and future.

(a) Past Infringement

Du Pont accepts the provision in the decree enjoining it from bringing any action for infringement prior to the date of the decree since, as far as it is aware, all producers in the United States have been licensed under its patents (R. 315).[2]

Actually, we think that, under the facts of this particular case, the District Court went too far. As it had found that du Pont had never refused a license, that du Pont had licensed newcomers as far back as 1935 and 1937, and that du Pont had never collaborated with National Lead in the granting of licenses, we see no genuine or technical reason why it was necessary to the effectiveness of the anti-trust decree in this case to deprive du Pont of all rights to recovery for patent infringement prior to this date. Acquiescence in that provision, and the District Court's exercise of the power to make it, surely represents

[2]The record in the present case consists of two volumes containing the proceedings below which run from pages 1 through 1289 and four volumes of exhibits which run from pages 1 through 4399. "R." references are to the volumes containing the proceedings below and "Ex. R." references are to the volumes of exhibits.

the maximum of taking of du Pont's property which is justified on this record.

(b) Future Patents

The District Court's view was that the provisions for reasonable royalty could properly extend to patents issued within five years subsequent to the date of the decree (R. 313). The government assigned no error to this provision, and even the government's motion in this Court for leave to amend its assignments does not attack this provision. The assignment of error by the government limits its application to "existing titanium pigment patents" (R. 330). The government must thus be taken to have conceded that a reasonable royalty provision is appropriate in this decree covering future patents issuing over the next five years, and that it was proper for this decree to make no provision as to the licensing of patents issuing after five years.

Du Pont takes two alternative positions on this subject of future patents (issuing in the five year period).

First, du Pont submits that it is unsound in principle to include *any* compulsory licensing provision in respect of patents to issue in the future. The future will be free of anti-trust violation, for it is the function of the decree to make it so.

Alternatively, *second*, du Pont submits that if compulsory licensing of future patents is to be ordered, it must at least be (as in the District Court decree) for a reasonable royalty.

And this, as we have said, is conceded by the government. That concession undermines and destroys the greater part of the government's argument in this case. The backbone of that argument (in respect of *present* patents)

is that the Courts are *incompetent* to administer any system of reasonable royalties; that such Court administration would be "unworkable". That whole thesis falls to the ground when it is realized that the government concedes that it is workable in respect to future patents. The government thesis is also in direct conflict with the Congressional directive that the Courts *shall* determine reasonable royalties in proper cases, Public L. 587, 79th Cong., *supra*, and with the practice of the Courts in patent infringement cases. *Dowagiac* and *Suffolk* cases, *supra*.

(c) Present Patents

The onslaught which the government makes on the *Hartford-Empire* case has application only in this field of present patents. When it is realized that the government is dealing only with present patents,—excluding past infringement and excluding all future patents,—it becomes readily evident that the government has pitched its tone too high.

The government wishes this Court now to say that it was wrong in the *Hartford-Empire* case to direct that reasonable royalties might be reserved for present patents but, at the same time, the government is ready to concede that this Court was right in the *Hartford-Empire* case in its disposition of past infringement (restraining suits therefor) and in its disposition for future patents (permitting reasonable royalty therefor). But we do not find in the entire government brief any argument as to why the *Hartford-Empire* case was wrong in one particular, while right in the others. Throughout the onslaught on the *Hartford-Empire* case in the government brief, that decision is treated as a unit.

Du Pont will of course argue in this brief that the *Hartford-Empire* decision was sound and should not be overruled.

But even if *arguendo* the *Hartford-Empire* case may come to be overruled or limited in a case involving similar facts, du Pont submits that it is quite unnecessary to take up that delicate question in this case, because here the facts are so much more favorable to du Pont.

COMMENT ON THE GOVERNMENT'S HANDLING OF THE FACTS.

Before turning to our Argument, we wish to make brief reference to two fundamental respects in which we think that the government's statements and assumptions of fact are constantly distorted.[3]

(1) In this case there are practically no facts whatever in regard to which it can be said that the generic phrase "the defendants" should be properly used. In all of the factual 94 findings of the Judge, he used the phrase "the defendants" (as distinct from identification of the particular defendants in the particular findings) only 3 times (FF 1, 94, 96; R. 235, 303, 306). In contrast to this, the government has used the phrase "the defendants" in its brief 170 times. There is substantive point in the contrast. The Judge appreciated who were parties to each act or transaction and identified them; what he really found, and what was, of course, true as a fact, was that National Lead and du Pont were not jointly engaged in any of the acts or transactions.

---

[3]Other criticisms of the government's handling of the facts appear in Appendix C to this brief.

The general discussion in the government brief (*e.g.* 49-54) is interlarded with recurrent references to "the defendants" as if they were some *entity*. Doubtless National Lead and Titan may be treated as one.[4] But National Lead and du Pont have never been one; indeed, if there is one thread that runs through the record (as distinct from the government brief), it is the thread of competition, even to the point of animosity, between National Lead and du Pont. That conflict has come right down into the hearings on the decree where the two have been in conflict, and are now in conflict before this Court, on the question of royalty-free licensing.

(2) The government makes no distinction between finding no. 95, which is purely a conclusory or ultimate finding, and the 94 preceding findings, which are findings as to the proof in the record. We wish most strongly to urge upon this Court that a distinction must be drawn between the two types of finding. When a Judge has told the whole story as he sees it in detail over 94 findings, covering 70 pages of a record, as here (R. 234-303), we respectfully submit that, for an appellate court to accept a conclusory finding from a single Judge as entitled to any weight in itself, apart from his manifold detailed findings, would be to undermine the whole validity of the appeal on the facts to which the parties are entitled.

The ultimate finding no. 95 appears at R. 303-306. Wherever this Court finds in the government brief a record reference to those pages, it may know that the government is only relying upon the ultimate finding and has no specific finding to support what it is saying.

---

[4]We will not, again, refer to Titan in this brief, as it is a 100% subsidiary of National Lead (FF 5, R. 236).

POINT I.

THE RELIEF GRANTED BY THE DISTRICT COURT WAS MORE THAN ADEQUATE. INDEED, THE RELIEF SHOULD BE LIMITED TO AN INJUNCTION.

The government brief is forced to recognize factors in du Pont's favor which render invalid the conception that "the defendants" are to be lumped as one. Thus, the government recognizes:

That the problem before du Pont in the early days was as to how to get into the industry at all in competition with the already existing cartel (how "to make some arrangement with NL which would permit it [du Pont] to enter the industry") (26);

That du Pont made no agreement with the cartel, but that the case against du Pont must rest on the theory that it was illegal merely to give "assurances" as to its existing intentions, for, says the government, it was "as a result of them" that du Pont "became a party to the worldwide combination" (29);

That as early as 1938 du Pont excluded research and development information from the exchange of information with National Lead (32-33),—thus, nine years before the decree which is about to be "moulded";

That du Pont terminated entirely the exchange of information when the industry became "mature" (32), and that this was in May, 1940,—thus, seven years before the decree which is about to be "moulded";

That there is in fact active competition for customers between National Lead and du Pont, and no

agreement between them as to price identity, but, indeed, that there have been repeated reductions in prices with few increases (34-35);

As to the future, which is the important time from the point of view of the decree, the government recognizes:

That restraint on foreign competition is a dead issue today, for, says the government (52):

> "it is demonstrable that there will be either no or negligible competition from them [the foreign producers]. They are located in war-ravaged countries. The record does not show if their plants are in, or can be restored to, production. Furthermore, there is good reason to believe that they will not desire to export in view of their long established policy of non-competition and lack of contacts in this country";

That even during the years before the war there was no realistic chance whatsoever of foreign competition, for at one point the government admits that the United States tariff was 30% ad valorem (10); and then the government itself makes an extended argument (56-59) that a 2% differential in price would be fatal to competition. The government is in the inconsistent position of saying that the foreign competitors could have easily competed against a 30% differential, but that no American company is capable of competing against a 2% differential when the 2% is consideration for actual research investment by its competitor.

It is difficult to imagine a state of facts upon which it could be more clearly said that the classic anti-trust relief of cancellation of the agreements, and an injunction against

entering into like agreements (always necessarily under the sanction that a violation would lead to contempt proceedings), suffices.[5]

The gravamen of the government's argument to the contrary is that there is *power* in the Court to enter whatever decree is necessary "to neutralize unlawfully created and continually operating forces destructive of the interests protected by the Act" (48-49). We agree. To repeat Mr. Justice Rutledge's dissent in the *Hartford-Empire* case, as quoted by the government (49):

> "One may start, *with the Court,* upon the basic idea that, in such a proceeding, the decree's function is not to impose sheer 'punishment' for past misconduct, but is rather to devise effective measures to prevent its repetition and dissipate its consequences".

The question is as to what measures are required on this record.[6]

---

[5]We cannot escape the conviction that what the government brief was really written about were not the facts as found after the actual trial in this case, but the facts as the government imagined them at the time that it first commenced the proceedings. The *assumed* facts in the brief,—above all, the constant linking of "the defendants" as if they were one,—bears no resemblance to the opinion or findings of fact by the District Court, but it does bear a certain resemblance to the chapter on "Titanium" in Wendell Berge, *Cartels,* Public Affairs Press, 1943.

[6]The government falls into the error (54-55) of assuming that, because we did not object at the hearing on the decree (R. 1240) to compulsory licensing, we "conceded" that our patents should be licensed. The government says that it was "at the request of the defendants" (55) that the District Court included the provision for a reasonable royalty. But this is no more than to say that if the defendants had to submit to a compulsory licens-

If the Court follows what we submit to be the correct course, *viz.*, striking out of the decree the order against du Pont for compulsory licensing, there is nothing in the record upon which to base any assumption that du Pont will not in fact grant licenses. What there is in the record, justifies the assumption that du Pont will in fact continue to grant licenses in a free competitive system (FF 83, R. 295).

A fortiori, there is nothing in the record to indicate that du Pont's royalties will be more than reasonable.

Let us review what is the actual misconduct found against du Pont.

(1) The only such misconduct was that du Pont gave assurances in 1933 through National Lead to the Germans that it did not then intend to engage in the export trade, and that that assurance encouraged the Germans in some way. The consequences of that action have long since been dissipated, and no measure is required to prevent its repetition. At the most, an injunction would suffice.

(2) Let us go further and suppose for the sake of the argument that it was illegal for du Pont to exchange technical information with National Lead between 1933 and 1940. The government has not introduced one word of evidence to show that this has had any adverse conse-

---

ing provision at all, then they requested that it contain a provision for reasonable royalty. We certainly did object to any order of compulsory licensing and assigned error on this point (R. 345) but the argument reported at R. 1240, as well as du Pont's counter proposed form of decree, proceeded on the assumption that there was to be an order for compulsory licensing (*cf.* R. 1241) and was addressed to the question whether it should be royalty-free.

quences upon competition, or that if it has had any such, they have not now been long since dissipated. Zirconium and Virginia Chemical entered the business during the period of the exchange, and the exchange itself has ceased for seven years past. Upon this showing there is nothing to suggest that the parties intend to recommence exchange of technical information and, accordingly, even an injunction seems unnecessary.

(3) Let us go still further and suppose that this Court overrules the *Cracking* case, *United States* v. *Standard Oil Company* (*Indiana*), 283 U. S. 163, and thus holds that it was illegal for du Pont to make its cross-licensing agreement with National Lead. The District Court seems to have the view that this decision ought to be overruled, for it suggested that it is a wrong for two prominent companies not to litigate each other's patents and to cross-license one another under future patents. As explained in our main brief in No. 91, both factors were fully present in the *Cracking* case. If the Court is now to make new law for the future on this subject, we must, of course, accept the consequences in the form of an injunction requiring the agreement to be cancelled and forbidding us to enter into a similar agreement. But again, no reason appears why relief should go any further.

To put it shortly, there has been no substantial evidence in this case that du Pont's patents themselves have been "improperly used" by it. On the assumption that the case is affirmed on the merits, it will have been held that du Pont violated the Sherman Act in giving an assurance that it would not engage in export trade and in thereby encouraging Europeans not to engage in American import trade.

That is the sum and substance of the wrong that the District Judge found, and it provides no justification for any decree ordering the licensing of patents now and in the future.

In asking more, the government is overlooking the fact that du Pont is not in any way united to or cooperating with National Lead. This is the type of case in which an injunction suffices because the injunction would prevent parties, if they ever were together, from coming together again. This case is one, then, to which the government quotation (48) from the *Standard Oil* case, 221 U. S. 1, 77, is apposite:

> "It may be conceded that *ordinarily* where it was found that acts had been done in violation of the statute, adequate measure of relief would result from restraining the doing of such acts in the future. *Swift* v. *United States*, 196 U. S. 375" (Italics ours).

POINT II.

THE COURT IS WITHOUT POWER TO ORDER ROYALTY-FREE LICENSING

(1) Royalty-free Licensing Would Be Inconsistent with the Decisions of this Court.

The government urges that not only should there be compulsory licensing, but that such licensing should be ordered royalty-free as to existing patents.

It is of course self-evident that patents are property like any other property, protected by the Constitution itself and by statute. *Seymour* v. *Osborne*, 11 Wall. 516, 533;

Cammeyer v. *Newton*, 94 U. S. 225, 226; *James* v. *Campbell*, 104 U. S. 356, 357-8; *Hollister* v. *Benedict & Burnham Manufacturing Company*, 113 U. S. 59, 67; *Solomons* v. *United States*, 137 U. S. 342, 346; *William Cramp & Sons Ship & Engine Building Company* v. *International Curtis Marine Turbine Company*, 246 U. S. 28, 39-40; *United States* v. *Dubilier Condenser Corp.*, 289 U. S. 178, 186-7; *Hartford-Empire Company* v. *United States*, 323 U. S. 386, 415.

The patents of a patentee who violates the anti-trust laws—this Court has repeatedly held—are as much property protected by the law as the patents of any other person. Such a patentee—while subject to the remedies specifically provided by the anti-trust laws—does not become an outlaw to be despoiled of all his patent possessions.

In *Standard Sanitary Mfg. Co.* v. *United States*, 226 U. S. 20, for example, patent license agreements were found to have violated the Sherman Act. The question then arose as to the status of the patents so used. The decree answered this question by stating expressly that the patents were not forfeited but should remain enforceable:

> "* * * this decree shall not be construed to prevent whoever may be the owner or owners of the Arrott patent and other dredger patents relating to the manufacture of sanitary enameled ironware, from granting lawful licenses to any of the defendants or others to use such patents, or to prevent the defendants or others from taking lawful licenses to use any of such patents" (Decrees and Judgments in Federal Anti-trust Cases (1918), p. 265).

In *United States* v. *Motion Picture Patents Co.*, 225 Fed. 800 (E. D. Pa.), appeal dismissed 247 U. S. 524,

patent agreements likewise were found to have violated the anti-trust laws. There once more the court refused to forfeit the patents involved. Instead the decree of the court flatly stated that:

> "Nothing in this decree contained shall be construed to prevent whoever may be the owner or owners of the patents relating to the motion picture art named in the pleadings and evidence herein from granting lawful licenses under lawful conditions to any of the defendants or to others, nor to prevent the defendants or others from taking lawful licenses from the owners of said patents. Nothing herein contained shall be construed to prohibit whoever may be the owner of the said patent or patents from collecting royalties in the future from licensees" (Decrees and Judgments in Federal Anti-Trust Cases (1918), pp. 379-380).

Ethyl Gasoline Corp. v. *United States*, 309 U. S. 436, is particularly in point. There (a) certain patents, (b) certain licenses to refiners, and (c) certain fictitious licenses to jobbers, were found to have been used in violation of the anti-trust laws. This Court, however, in no wise ordered confiscation. The patents were left intact; the licenses to refiners were revised by the deletion of objectionable clauses but otherwise left standing; while only the fictitious licenses to jobbers—being disguised resale price maintenance agreements rather than licenses—were stricken down. Accord: *United States* v. *Univis Lens Co.*, 316 U. S. 241.

In short, the courts have no more destroyed patents, when confronted with patent misuse, than they have ordered the destruction of the plants and other physical property of the *Standard Oil* and *Tobacco* aggregations in 221 U. S. 1 and 106. Cf. *United States* v. *Terminal Railroad Asso-*

ciation of St. Louis, 224 U. S. 383, where the defendants had the option *either* of breaking up a monopolistic railroad terminal *or* of compulsory dealing on *reasonably* compensatory terms. They were not required to do both. Accordingly, no forfeiture was involved.

Another argument offered by the government is that the *Hartford-Empire* case is to be distinguished because the licenses there covered rental and servicing of machinery as well (97). The distinction does not hold water, for there were many defendants in that case, to all of whom the decree applied equally, but who were not concerned with rental or servicing of machinery. In fact, this Court clearly stated that the uniform reasonable royalties to be charged might include only a charge for "the use of the patents for the production of glassware on the leased machines", and that each licensee should have the option to determine whether it desired, in addition, to pay for the rental of machinery or the servicing of machines (324 U. S. 573 at 574; and see final judgment entered October 31, 1945, par. 13 (B)).

The government also argues that this Court must have determined in the *Hartford-Empire* case that a court of equity may not order adequate anti-trust relief if the result would be that property values are destroyed (104). But the government misinterprets the decision. The distinction is real between direct confiscation by Court order and an anti-trust decree which incidentally impairs property values. Compulsory licensing at reasonable royalties (as in *Hartford-Empire*), forced sale of assets, cancellation of contract rights, etc. all may involve dilution of property values. Royalty-free licensing, however, involves a declaration that the patent is null and void. The patentee can no longer

utilize the patent for any purpose, past or prospective. It in effect is cancellation of the patent.

The government goes on to argue that "where the lawful portion of the value of defendants' patents cannot be segregated from the value resulting from the unlawful combination, defendants are entitled to no return on the patents" (118). Here again no effort is made to connect the proposition to the facts of this case. No record reference whatsoever is given. Whether or not the 1933 non-exclusive, cross-licensing agreement was unlawful in itself (notwithstanding the *Cracking* case), or whether or not it was vitiated by some contemporary "assurance" given by du Pont on the subject of export trade, it remains undisputed that du Pont was entirely independent in the acquisition of its own patents, and was equally independent in the licensing of them. This is not a case for application of doctrines about "valid parts of an invalid whole" (120), for the patents are "not parts of a whole", but independent property rights in themselves having, under the decisions of this Court, no greater and no less value than attaches to them in their own right.

Rightly interpreted, the decisions of this Court in the modern patent cases, which the government invoked in its review of the present condition of the patent law, are themselves destructive of the government's viewpoint. That viewpoint is that a patent is somehow a combination of itself and of some intangible attribute clinging to it as a result of the history of the manner in which it has been used. But that is just what this Court has held that a patent is not. A patent can derive no extra strength or validity from the manner in which it is used, and correspondingly, its integrity *qua* patent cannot be chipped by extraneous allusions to the manner in which it is claimed to be used. It remains a patent, and no more.

(2) Royalty-free Licensing Would Be Inconsistent with Legislative History Since the *Hartford-Empire* Case

Congress has in fact passed affirmative legislation since the *Hartford-Empire* decision. Public Law 587, 79th Cong., 2d Sess., provides:

> "* * * upon a judgment being rendered in any case for an infringement the complainant shall be entitled to recover general damages which shall be compensation for making, using, or selling the invention, *not less than a reasonable royalty therefor* * * *". (Italics ours.)

This is a mandatory direction to the Federal Courts to determine reasonable royalties. The only way to determine what is "not less than a reasonable royalty" is to determine what is a reasonable royalty.

Legislative action granting courts jurisdiction to forfeit misused patents has been sought both prior and subsequent to the *Hartford-Empire* decision; but the Congress has not approved. The opinion of this Court in the *Hartford-Empire* case summarized much legislative history showing that Congress since 1908 has repeatedly failed to adopt legislation giving power to the Judiciary to cancel patents which have been used as instruments to violate the anti-trust laws (323 U. S. at 416). After the Court's decision was brought to its attention, Congress still refused to act.

Following the decision, bills were introduced in each house of Congress seeking to give Federal Courts specific power to declare patents used in violation of the anti-trust laws null and void (79th Congress, 1st Sess. H. R. 97, 2612 and 3462). Congressman Voorhis, one of the sponsors of the bills, asserted that the necessity for action was

made clear by the decision of this Court in refusing to order royalty-free licensing in the *Hartford-Empire* case. Cong. Rec. January 15, 1945, p. A148, January 16, 1945, p. 296. These bills were not made law.

In response to a request made on June 26, 1946, by the Chairman of the Monopoly Subcommittee of the Committee on Small Business of the House of Representatives, the Attorney General, in commenting on inadequacies in the present anti-trust laws, endorsed H. R. 97 and called attention to the decision in the *Hartford-Empire* case and of the District Court in this case refusing to order royalty-free, compulsory licensing. The Attorney General urged that additional legislative relief was necessary to prevent the collection of royalties under patents used in violation of the Sherman Act. *United States versus Economic Concentration and Monopoly, Report Committee on Small Business,* pursuant H. Res. 64, page 251:

> "Recent cases have also shown the wide use made by monopolistic corporations of patents or aggregations of patents to eliminate competition. It is now settled that the United States in an antitrust case can secure compulsory licensing of patents at a reasonable royalty. In the Hartford-Empire and National Lead cases the relief given by the court covered both present and future patents. In our view, however, this is not sufficient relief to eliminate the effects of an unlawful use of the patents. Patents are granted for a public purpose. We believe that additional relief is necessary to prevent further use of a patent in violation of the antitrust laws and indeed to prevent the monopolist from recovering royalties under his patents. H. R. 97, introduced by Congressman Voorhis, was designed to take care of this situation."

In the present Congress a bill to the same effect introduced by Senator Morse on behalf of himself and seven other senators has been referred for consideration to the Committee on the Judiciary. (80th Congress, 1st Sess., S. 72.) Hearings on the bill are contemplated soon, and thus the proposal will again receive the consideration of Congress.

We submit that this is the type of case in which legislative silence has significance. When a specific decision of the Court having such significant implication in the field of anti-trust policy is called to the attention of the Congress, and Congress fails to act, some considerable degree of approval of the decision may be inferred. Cf. *Cleveland* v. *United States*, this term, decided November 18, 1946.

Indeed, in this case there is more than legislative silence. The subject is currently before Congress. Certainly at this stage the problem is legislative and further judicial declaration would be highly inappropriate.

POINT III.

ROYALTY-FREE LICENSING IS INAPPROPRIATE IN THIS CASE.

(1) Competition Will Flourish Under Reasonable Royalty Licensing.

In considering whether royalty-free licensing should be ordered in this case, the Court will have in mind that one of the primary objectives of an anti-trust decree is to eliminate unlawful restraint which may tend to impair competition. There is no finding or evidence here, however, that the charging of royalties has in any way prevented the development of competition.

Not only did du Pont grant licenses to all applicants, but it charged a fair and reasonable royalty of 2%. Under this royalty, licenses were granted to both Zirconium and Virginia Chemical. These concerns have manufactured titanium pigments over a period of approximately ten years (du Pont's main brief in No. 91, pp. 104-105). Their products have been successfully sold in competition with du Pont and National Lead. The relative position of their manufacturing capacity in the industry has steadily grown. There is substantial evidence that at least one of these companies is now and has for some time been engaged in constructing additional capacity.[7]

It is significant that the government did not call representatives of either of these licensees to testify whether they had any complaint or criticism of the royalty charged.

There is also reason to believe that the reasonable royalty provisions of the decree will not deter the entrance into the industry of new competitors. Only recently a substantial concern, New Jersey Zinc Corporation, requested of du Pont licenses under various titanium pigment patents

---

[7]Du Pont offered to prove that additional capacity was being constructed (R. 1246). Applications of the American Cyanamid Company, the parent of Virginia Chemical, to the War Production Board (Serial 140937), and releases of that company published in newspapers and trade journals, establish that it recently acquired a plant for the manufacture of titanium pigments at Gloucester, New Jersey, which was being prepared for the manufacture of 3,000 net tons per month, and that additional capacity was being added at its plant at Piney River Works, Virginia. See American Inkmaker, September 1946, and Chemical & Engineering News, April 25, 1945.

This is not of course in the record. We follow the example of the government (*e. g.* 52) and of National Lead (its brief, p. 40) in keeping the Court of Equity up-to-date on actual developments.

and asked du Pont to quote appropriate royalties. Negotiations and discussions between du Pont and New Jersey Zinc are in progress. This company, which is an important white pigment manufacturer, in fact the largest producer of lithopone (R. 1159, 1171-1172), is presumably familiar with the operating conditions of the industry and qualified by reason of capital and technical personnel to enter the industry.

The government speaks of the duty of this Court "to restore the industry to the free system of competition" (41). The government's use of the verb "restore" shows how it develops its arguments in disregard of the facts of the particular case. The titanium industry is an entirely new industry that was created after World War I, in which the first to enter it in the United States on a commercial scale was National Lead, the second was du Pont (succeeding Commercial Pigments), the third was Zirconium, and the fourth was Virginia Chemical. To "restore" the industry to the condition it was in when du Pont entered it, would be to reinstate the 100% National Lead monopoly.

The government presents a mathematical argument that no royalties should be permitted because that increases the cost of the royalty payer (41, 56). This is a truism equally applicable to every cost. It is not the function of this Court to equalize costs. For all that the record shows, du Pont may well have invested more in research and other cost of developing its patents than any competitor is going to have to pay in royalties for their use. Doubtless, the cost would be a factor that the District Court might take into consideration in fixing the reasonableness of the royalty.

Wherever throughout industry a licensee competes with a licensor, the government could indulge the same rhetoric

to the effect that the royalty is a "double subsidy" to the licensor. The conception that there cannot be competition unless costs are all equalized is naive in the extreme. If Virginia Chemical's plant pays a lower rental than du Pont's, is this Court to change the rentals so that du Pont can be on a competitive equality? If Zirconium pays lower State taxes in Ohio than du Pont does in Maryland or Delaware, is this Court to order Zirconium to pay higher taxes so that the costs may be equal?

(2) There Are No Unduly Onerous Administrative Obligations Placed Upon the Courts by Reasonable Royalty Licensing.

One of the important arguments advanced in the government brief in urging royalty-free licensing is that the Courts lack the *capacity* or *ability* to conduct such administration as may be involved in determining whether a rate of royalty is in fact reasonable (63). The government's expression is that such decrees are "unworkable."

Reference has already been made to what seems the decisive argument against the government's position that Court determination of reasonableness of royalty is unworkable. We refer to the enactment in 1946 of Public Law 587 of the 79th Congress, directing Courts to determine the reasonableness of royalties in patent infringement suits. What the Courts are capable of doing in one type of suit, they are capable of doing in another.

Moreover, the government is really in an impossible position on this issue, as it has not contested the provision for reasonable royalties for future patents. Its original assignment of error on the subject was only to the effect that present patents should be required to be licensed

royalty-free until the effects of the alleged conspiracy had been dissipated (R. 330). By motion in this Court (which we oppose), it is asking leave to amend the assignment so as to require royalty-free licensing of present patents in perpetuity. But not even in this Court has it contested the validity of the provision in the decree for reasonable royalties under future patents.

In any event, it is difficult to understand the government's present contention that courts are without the capacity to administer reasonable royalty licensing, in view of the large number of anti-trust consent decrees which have been approved by the government, both prior and subsequent to the decision in the *Hartford-Empire* case, providing for licensing at reasonable royalties.[8] Pertinent excerpts from these cases are set forth in Appendix B.

---

[8]These cases include the following: *United States* v. *Standard Oil Co. (New Jersey)*, C. C. H. Fed. Tr. Reg. Serv. Par. 52,768 (D. N. J. (1942)); *United States* v. *Standard Oil Co. (New Jersey)*, C. C. H. Fed. Tr. Reg. Serv. Par. 52,927 (D. N. J. Civil Action No. 2091 (1943)); *United States* v. *General Electric Co., Westinghouse Electric & Manufacturing Co.*, C. C. H. Fed. Tr. Reg. Serv. Par. 52,777 (D. N. J. No. 1364 (1942)); *United States* v. *Aluminum Company of America*, C. C. H. Fed. Tr. Reg. Serv. Par. 52,776 (S. D. N. Y. (1942)); *United States* v. *American Bosch Corp.*, C. C. H. Fed. Tr. Reg. Serv. Par. 52,888 (S. D. N. Y. Civil Action No. 20-164 (1942)); *Crosby Steam Gage & Valve Co.* v. *Manning, Maxwell & Moore, Inc., United States, Intervenor-Defendant*, C. C. H. Fed. Tr. Reg. Serv. Par. 57,336 (D. Mass. Civil Action No. 2267 (1945)); *United States* v. *American Air Filter Co., Inc.*, C. C. H. Fed. Tr. Reg. Serv. Par. 57,492 (W. D. Ky. Civil Action No. 574 (1946)); *United States and Alien Property Custodian* v. *Bendix Aviation Corp.*, C. C. H. Fed. Tr. Reg. Serv. Par. 57,444 (D. N. J. Civil Action No. 2531 (1946)); *United States* v. *The Diamond Match Co.*, C. C. H. Fed. Tr. Reg. Serv. Par. 57,456 (S. D. N. Y. Civil Action No. 25-397 (1946)); *United States* v. *General Electric Co., Corning Glass Works*, C. C. H. Fed.

Indeed, there has been an opportunity, since the decision of this Court in the *Hartford-Empire* case, to test the workability of that decree. It does seem as if the government, in questioning the workability of that decree, ought at least to have come here with a full report on the hearings below. All that we are told in the government brief about the *Hartford-Empire* proceedings below is that "consideration of these difficulties as illustrated by subsequent experiences in the Hartford case itself, indicates that they constitute an independent ground against permitting any continued vitality in the abused grants" (64-65). What these experiences were, or who thought that they "indicated" something, is not revealed.[9]

We have made inquiries and are advised that there has been no difficulty in working out a scheme of reasonable royalties in the *Hartford-Empire* proceedings, except only in respect of one single point. Under paragraph 13 of the final judgment entered October 31, 1945, each of seven

---

Tr. Reg. Serv. Par. 57,448 (D. N. J. Civil Action Nos. 1364 and 2590 (1946)); *United States* v. *Libbey-Owens-Ford Glass Co.*, C. C. H. Fed. Tr. Reg. Serv. Par. 57,489 (N. D. Ohio Civil Action No. 5239 (1946)); *United States* v. *Owens-Illinois Glass Company*, C. C. H. Fed. Tr. Reg. Serv. Par. 57,498 (N. D. Cal. Civil Action No. 25861-C (1946)).

[9]One comprehensive review of the *workability* of the *Hartford-Empire* decree has been published, 56 Yale L. J. 77. The whole tenor of the article is to the effect that the Court-supervised reasonable royalty system has provided the anti-trust division with an effective instrument which it did not have before. Various methods of meeting the problem of determining reasonable royalties are pointed out to be available: that "most disputes could presumably be settled by negotiation"; appointment of a Master; arbitration; reference to the Federal Trade Commission; or development of an effective enforcement division within the anti-trust division of the Department of Justice.

defendants was required to designate separately the proposed charge for each of five separate privileges in respect of each of five classes of machines, which required the filing of schedules showing 175 separate proposed charges. The only proposed charges in respect of which there was any difficulty were the royalties to be charged by two of the defendants (Hartford and Lynch) under a license to another machinery manufacturer to make and sell, which was a highly theoretical problem because no such machinery manufacturer had applied for any such license. Furthermore, the problem was created by the government itself, which refused to allow the royalty to be measured by the quantity of glassware handled by the machines.

There are, therefore, no materials before this Court upon which to base this overruling of its recent opinion, except the same materials which were then available. These all reappear in the present government brief.

It is settled practice in patent accounting suits that, where the profits or damages cannot be ascertained, and no standard of comparison is available, the Court may allow a reasonable royalty. This has been settled practice since at least 1915, when it was approved by this Court in *Dowagiac Manufacturing Company* v. *Minnesota Moline Plow Company*, 235 U. S. 641, 648.[10] Indeed, the principle dates back to the decision in 1865 of *The Suffolk Company* v. *Hayden*, 70 U. S. 315, 320. In our experience, the practice of determining a reasonable royalty is frequently availed of. See 3 *Walker*, Patents, § 833, and 1945 pocket supplement. We list in a footnote (in alphabetical order and giving dates)

---

[10]The *Dowagiac* case was referred to in *Sheldon* v. *Metro-Goldwyn*, 309 U. S. 390, 404, as a case "which received great consideration". Both *Dowagiac* and *Sheldon* were unanimous decisions, only Mr. Justice McReynolds not participating.

over 100 decisions of the Federal courts dealing with reasonable royalties, which show not only their broad experience in this field but their capacity to deal with the problem.[11]

The government's own review of earlier authorities makes no reference to any of these cases, but opens with

What the Court actually said in that case, was that what was there sought to be done did *not* impose "an onerous and absorbing administrative burden".[12]

No valid reason appears why this Court should now say that it is impossible for a court of equity to value a patent. The government unduly complicates the matter by talking as if the Courts will necessarily have to value *all* of the patents. Thus, its brief says that, "In the instant case the court will have to place a value upon each of 351 patents and applications" (67). This is an over-statement of the decree. The decree provides that any party may take a license under "any or all" of the patents, *i.e.*, may select "any" of them. If it selects one patent, the value will only have to be placed upon that one, etc.

But even if a licensee were to select a great many patents, that is not in itself a reason for the Courts to sus-

---

4th, 1935); *Tilghman* v. *Procter*, 125 U. S. 136 (1888); *Triplex Safety Glass Co. of North America* v. *Duplate Corp.*, 10 F. Supp. 420 (W. D. Pa. 1934) modified and referred in part, 81 F. [12] What was there sought to be done, was to retain supervision by the Court of future theatre acquisitions.

pend their duties. It would be a new rule of equity to provide that equity can no longer try a case because it has become a difficult one. The Courts are constantly required to place values upon property; and if the Patent Office is going to grant 351 patents, there is no inherent reason why the Court should not value the 351, if a licensee wants all of them. Doubtless some patents would be given a very small, if any, value, and the whole thing would be worked out in a practical way as is befitting Court supervision of any complicated financial or economic transaction. Even under Court supervision, it would doubtless be appropriate for the Court first to ask the two parties to seek to reach an agreement, just as is done every day in contests between security-holders, and then for the Court to hold a hearing, at which of course the Attorney General would be represented, to determine whether the agreement reached (a) was not the result of over-reaching or domination of one party by the other, and (b) was not incompatible with the public interest as represented by the Attorney General.

In bankruptcy cases, the Federal Courts are constantly called upon to set comparative values upon conflicting claims of a very much larger amount. In valuing the claims of mortgagees of various divisions of a railroad, for example, the Court does not enter upon the meticulous type of valuation that might be indulged, for example, by local taxing authorities. Other techniques have been devised, and work. There is no evidence that techniques may not be worked out for the ready determination of reasonable royalties.

At all events, this not a case in which the contrary can be held. Ten years of experience should have enabled the government to find evidence, if there be any, that Virginia

Chemical or American Zirconium have complained that the 2% royalty that they paid to du Pont was unreasonable. That royalty was reached by arm's-length negotiation.

The price-fixing cases cited by the government (75), *United States* v. *Trenton Potteries,* 273 U. S. 392, and *United States* v. *Socony-Vacuum Oil Co.,* 310 U. S. 150, are not in point. They did not hold that a Court could not on occasion determine a reasonable price; they held that it was a restraint of trade for two private parties to agree upon prices, regardless of whether reasonable. The price-fixing cases would only be in point if the Court had there indicated that the defendants in those cases ought to have been compelled to give away the offending articles free.

Or there might be an analogy to the present proposal that the patentee be deprived of his licensing revenue (the royalty) if in the *Socony* case, for example, it had been provided that the oil companies must thereafter sell at the wholesale price, without any manufacturer's profit.

After all, the government is saying nothing more than that the inventors' or patentees' profit, known as a royalty, is necessarily one element of cost, and that, therefore, where a competitor is a patentee, it has a *pro tanto* saving or competitive advantage. The government wholly overlooks the obvious response that the patentee has an investment in the research or in the purchase of the patent, just as the oil refiner (in the example given) has an investment in the process of manufacture. The District Judge, who will presumably administer the decree, has taken a much more realistic view of what a reasonable royalty really is, saying:

> "I am using the word 'modest' in lieu of the word 'reasonable' because I want to suggest what is intended, the intention being a condition such as

the industry can readily handle without establishing an undue advantage one over the other not justified by an investment involved in these patent ownerships, and also as it is suggested in one of these propositions, not only as to all existing patents but as to all patents filed or issued over a period of five years, or all applications that will be filed over a period of years, I do not remember which" (R. 1253).

* * * * * * * *

"And I think that I would go along with Mr. Webster to this extent, that if as a result of the taking of the testimony it appeared as a matter of fact, not of law, but as a matter of fact that the value of the patent, and therefore the reasonableness of the royalty, or the cost of the patent and therefore the reasonableness of royalty, or whatever evidence might be relevant to a determination of that question, approaching zero, I think the court would not have to be ritualistic and apply the traditional symbols and could say "Zero" without offending the law, but that would be a zero arrived at by a different process. In other words, that would be a zero arrived at by process of evaluation. I am tentatively under the impression that the decree does contemplate a process of appraising, a process of evaluation." (Stenographer's Minutes, Oct. 24, 1946, p. 45, Hearing before Hon. Simon H. Rifkind on National Lead's motion.)

The government's contention that reasonable royalty licensing is unworkable is not supported either by judicial or business experience.

(3) Royalty-free Licensing Favors National Lead.

Apart from the foregoing, a most unusual situation exists in this litigation bearing on the issue of royalty-

free licensing. We refer to the amazing position taken by National Lead in joining with the government to seek royalty-free licensing. National Lead in the court below argued in favor of licensing at reasonable royalties. It now admits that it violated the Sherman Act. That it was the principal defendant and proceeded with little regard for the requirements of the Sherman Act, is patently clear from the findings of the court below. Its sudden shift from its original position is not dictated by any concession to the public interest. It urged licensing at reasonable royalties until it was brought forcefully to recognize that its patent position was not as strong as that of du Pont. As soon as it realized that its pocketbook was affected, its views on royalties changed.

In joining with the government on the royalty-free issue, it is not motivated by any desire to assist this Court in working out the delicate problems presented by a decree which seeks to balance the rights of the patent owner with the obligations imposed by the anti-trust laws. It desires merely to perpetuate its position in the industry with the least cost to itself. Having this position, protected by its various cartel agreements, it has for a long time been able to proceed without energetically attempting to develop new processes.

National Lead now finds itself faced with the energetic competition of the smaller manufacturers and with constantly increasing competition of du Pont which broke off from technical exchange with National Lead in 1940. For commercial reasons it now desires a "free ride".

Certainly this Court should proceed with particular caution before it permits National Lead to utilize this litigation, in which it is the principal offender, for its own private pur-

poses. If National Lead desires royalty-free licensing as its concession suggests, this Court should impose royalty-free licensing upon it. This need not and should not involve imposing royalty-free licensing upon du Pont.

National Lead seeks to justify its present position (Brief, pp. 58-59) by asserting that it is consistent with its position in the District Court. Nothing could be farther from the facts.

At the hearing on the decree National Lead and du Pont both agreed that it would be error to order royalty-free licensing. Both distinguished the *Morton Sali* doctrine. National Lead filed a printed brief with the District Court in which it stated, under the heading "The proposed forfeiture of defendants' patents is unauthorized", that "only one view" could be taken of the government's proposal of royalty-free licensing of present patents; this view was: "In other words, the Supreme Court, despite the failure of Congress to enact compulsory licensing legislation, will approve a decree, in a proper case, making licensing mandatory, *but only on payment of a reasonable royalty*. There is thus no basis for the government's prayer for royalty-free licensing". (Italics in the original; National Lead brief in the District Court on the decree, p. 36).

After the decree, it became the duty of du Pont and National Lead to offer a license on terms of reasonable royalty. Correspondence between National Lead and du Pont on the subject is set out in Appendix A to this brief.[18] National Lead opened the matter by stating that it would grant licenses under all its patents. Its proposal was: (a) to parties having no patents under which National Lead should

[18]This correspondence was submitted by National Lead as a part of its record on its motion for royalty-free licensing before the District Court on October 24, 1946.

itself desire a license, a current royalty of 1% or a lump sum; (b) to parties having patents under which National Lead should desire a license, a royalty-free exchange (App. A p. 1).

Du Pont promptly replied that a royalty-free exchange did not appear feasible, that the royalty rate should be dependent upon the importance of the patents under which each would be licensed, and that du Pont was ready "to undertake negotiations * * * on a basis which is consistent with the terms of the decree" (App. A p. 2). Du Pont followed this with a letter saying that there were three National Lead patents under which it would desire a license and that the license should be "terminable on reasonable notice", for there was one patent under which du Pont would not expect to operate for more than six months, and the other two related to only a part of du Pont's production (App. A p. 3).

National Lead declined to consider the du Pont proposal and said that it would desire a license under all the du Pont patents (App. A p. 4).

Du Pont's reply was that the rate for a royalty under such patents would be 2%,—a rate which "we feel * * * will clearly permit competition", and reaffirmed that its own request was for a license under three named patents only, saying: "certainly an evaluation of these three patents presents no serious problem, and we stand ready to pay whatever reasonable royalty rate is established by you consistent with the decree for the licensing of these patents" (App. A p. 5). This was followed by a formal offer by du Pont to accept 2% as royalty under all its patents, and to pay as royalty for the three patents required by it "1% of the value of our production of pigments manufac-

tured under the licensed patents" (App. A pp. 6-7). Du Pont further stated (App. A p. 7):

> "As we have advised we consider your proposals for licensing prohibited by the decree and, for this as well as other reasons, they cannot be accepted by du Pont".

We respectfully submit that the position taken by du Pont was in accord with the decree and with the whole policy of the law relating to royalties under patents, as laid down by this Court, and that National Lead's position was untenable and directly in the teeth alike of the law and of the decree.

What National Lead obviously did, was to ask for a reasonable royalty provision as required by law, until it found that du Pont might not need its patents; whereupon it turned about and asked for a royalty-free license. This was done for its own commercial reasons. Its counsel thereupon attempted to argue to the District Court, as they have now done in their brief in this Court, precisely the opposite of what they had argued on the hearings on the decree.[14] There had in the interim been no change in the law.

The District Court directed that the National Lead motion should stand over until after the decision of this Court. In the event that reasonable royalty licensing is sustained, National Lead will be required to pay du Pont only the amount which the District Court, with its knowl-

---

[14]The government makes the suggestion that this is because National Lead has reached the pious conclusion "that reasonable royalty licensing of misused patents in this case cannot be effective or give adequate relief to prevent continued violations of the anti-trust laws" (58). The government was doubtless anxious to welcome an ally, regardless of the reasons for its conversion.

edge of the industry and its problems, finds reasonable. Surely such payment will not prevent the full accomplishments of the decree's objectives.

POINT IV.

THERE IS NO POLICY IN THE PATENT LAW OR ANTI-TRUST LAW REQUIRING THAT DU PONT'S PATENTS BE RENDERED UNENFORCEABLE FOR THEIR REMAINING TERMS.

(1) The *Morton Salt* Doctrine Is Inapposite.

The portion of the government brief dealing with this subject is unsupported by any Assignment of Error. The closest assignment was No. 1 (R. 330), that the patents should be compulsory licensed free of royalty until the Courts should have determined that the effects of the illegal combination have been fully dissipated.

The government's departure from its original Assignment of Error at this late stage of the case is significant of the fact that this case has been seized upon as an instrument to advance a philosophy unrelated to its particular facts.

The government renews in this case the argument which it made in the *Hartford-Empire* case and which the Court there rejected in the following language (323 U. S. at 415):

> "The Government urges that such forfeiture is justified by our recent decisions in *Morton Salt Co.* v. *G. S. Suppiger Co.*, 314 U. S. 488, and *B. B. Chemical Co.* v. *Ellis*, 314 U. S. 495. But those cases merely apply the doctrine that, so long as the patent owner is using his patent in violation of the antitrust laws, he cannot restrain infringement of it by others. We were not there concerned with

the problem whether, when a violation of the anti-trust laws was to be restrained and discontinued, the court could, as part of the relief, forfeit the patents of those who had been guilty of the violation. Lower federal courts have rightly refused to extend the doctrine of those cases to antitrust decrees by inserting forfeiture provisions" (footnotes omitted).

There is indeed a genuine distinction between the *Morton Salt* type of case and an anti-trust case. This can be illustrated by a simple analogy. Suppose that the owner of "A" farm, having unlawfully blocked the owner of "B" farm from any egress except over "A", sues to enjoin the owner of "B" from trespass; he may be denied his injunction until he has removed the block. However, it does not follow that, because the Court will refuse him the injunction until the effect of his unlawful block has been dissipated, it will affirmatively enter an order giving the owner of "B" a perpetual easement or right of way over "A".

The fault may, of course, be dissipated, as in *Novadel-Agene Corp.* v. *Frederic H. Penn.*, 119 F. (2d) 764, 766-7 (C. C. A. 5th), cert. denied 314 U. S. 645; *Sylvania Industrial Corp.* v. *Visking Corp.*, 132 F. (2d) 947, 958 (C. C. A. 4th), app. dism. 319 U. S. 771; *Universal Sewer Pipe Corp.* v. *General Const. Co.*, 42 F. Supp. 132, 134 (N. D. Ohio, E. D.).

The government also makes the inverted argument that if there were no decree and du Pont sued, it could be defeated under the *Morton Salt* doctrine, and that therefore it is the decree itself which is creating a right in du Pont which it would not otherwise have (43-44).

This misses the whole point of equity relief. By taking jurisdiction of the suit by the Attorney General, the Equity Court is discharging its duty of so ordering affairs in the industry as to put an end to the wrong-doing as from the date of the decree. Of course, that changes the legal relations of the parties from that date. It is the decree itself which dissipates the consequences of the assumed violation.

When a private party defendant establishes as a defense to an infringement suit that the plaintiff is using the patent illegally (whether in violation of the anti-trust laws or against public policy generally), that illegality is necessarily then subsisting and continuing. It becomes appropriate to withhold the assistance of equity to the patentee, for to grant that assistance would be to assist the wrong-doer.

But when the Attorney General intervenes, in accordance with the intent that Congress expressed in 1890, to prevent the illegality, and the Court takes jurisdiction and moulds a decree appropriate to that end, then from that time forward the illegality ceases to exist.

The government also marshals cases which do not deal with the *Morton Salt* type of situation, but which deal only with the interpretation and enforcement of patents. In their aggregate, all of these cases establish only that the courts are indeed astute to give every opportunity to contest the validity or scope of patents. They hold in effect that public interest requires that no legal impediments be put in the way of litigants who call patents into question.

The authorities to the effect that the Courts will not admit common law defenses to embarrass contest of validity of patents (applied to the doctrine of *res adjudicata* in the *Mercoid* case, 320 U. S. 661, and to the doctrine of estoppel in the recent *Katzinger* case, decided this term, January 6, 1947) would have application if, for example,

National Lead had asserted some patent right against du Pont, and had then attempted to defeat du Pont's right to defend itself by saying that du Pont had been *in pari delicto*. The principles of the *Mercoid* and *Katzinger* cases would presumably then have applied, so that du Pont's contest of National Lead's patent right could not have been defeated by the plea of *in pari delicto*. The *Mercoid-Katzinger* rule is not a rule to stifle patent proceedings and substitute confiscation. Nor has it been so applied. It is a rule to free patent contests from obstruction through pleas not going to the merits.

The government overlooks the obvious distinction between recognizing a patent right and then confiscating it, on the one hand, and holding that no patent right ever arose at all, on the other hand. In such cases as *Altoona Theatres* v. *Tri-Ergon*, 294 U. S. 477, 493, it was held that the claimant had not obtained a valid patent at all; such cases are not authority for taking a valid patent and then confiscating it.

In conclusion, therefore, there is no valid reason why, when the Attorney General and the Courts have discharged their statutory duty of preventing and restraining violations of the Act, the defendants should not thereafter receive reasonable royalties for use of their property. This is true, at least in cases where, as here, no serious claim can be made that the defendant in question has improperly acquired its patents or used its licensing powers as a weapon for the wrongdoing against which the decree is directed.

(2) Du Pont Has Scrupulously Exercised Its Patent Rights Within the Lawful Limits of the Authorized Grant.

The government brief states (99) that "The parties [*sic*] have tied as a condition to the exchange of exclusive

licenses under existing patents a requirement that all future patents relating to the broad field of the titanium industry be exclusively licensed to the conspirators". There is not a single "exchange of exclusive license" to which du Pont was a party, and in du Pont's licenses to Virginia Chemical and Zirconium there was no requirement that future patents be licensed to du Pont at all.

There follows in the government brief a great deal of discussion of territorial and marketing restrictions accomplished through patents, to none of which was du Pont a party. Then come such statements as these (100): "Licensing has been conditioned upon reciprocal undertakings to furnish all present and future 'know-how' to the cartel parties. The restrictions invoked by the parties as a condition to the waiving of the right to exclude extended beyond the life of any then existing patent".

In the du Pont licenses to Virginia Chemical and Zirconium, there was no requirement that the licensee should furnish any "know-how" to du Pont, there was no provision for future patents and there was no restriction extending beyond the life of any existing patent.

All these arguments of the government are addressed to the issue whether there shall be royalty-free compulsory licensing. They must thus have been directed exclusively against du Pont, for National Lead has expressly conceded that there ought to be such compulsory royalty-free licensing and has urged it. The government knew this when it was writing its brief, for it makes a point of it (58).

When the government does reach the name of "du Pont" (101), all that it can find to blame is this:

> "Competition in the acquisition of patents was proscribed in that defendants du Pont and National Lead adhered to the policy of privately determining

> which had priority in respect of patent claims which were the subject of interference proceedings in the Patent Office".

The government then denounces this practice generically. But the private settlement of Patent Office interferences was in direct conformity with the rule of law as laid down in Mr. Justice Brandeis's opinion for this Court in the *Cracking* case, 283 U. S. at 171:

> "Where there are legitimately conflicting claims or threatened interferences, a settlement by agreement, rather than litigation, is not precluded by the Act".

There was nothing arbitrary about these settlements between National Lead and du Pont. They were hard-fought, even to the extent of charging that one party had stolen the inventions of the other. Each was determined to obtain its own patents. See, for example, Ex. 487 (Ex. R. 1862). This is an extensive report, dated November 17, 1938, concerning "patent interferences", and was addressed by a representative of National Lead to its manager, Mr. Garesché. Reporting a trip to Wilmington, its author expresses his disturbance at finding that du Pont was ignoring "Dr. Jebsen's effort to establish friendly relations between the British and German Titan companies, on the one side, and Krebs [du Pont] on the other side" (Ex. R. 1863), for "we find that there was no possibility of dissuading du Pont from filing an application which might conflict with our application in case T-187 because, we were informed, all divisions of du Pont are under specific orders from the Executive Committee to file patent applications on everything that might possibly contain patentable subject-matter".

The record is clear that du Pont's Executive Committee required "the prompt filing of applications for United States letters patent covering all patentable inventions which may possess commercial value" (Ex. R. 4193).

Similarly, there is no basis for the government's constant and frequent assertion that defendants du Pont and National Lead aggregated three wholly separate competing patented processes, evidently referring to the Barton-Rossi, Jebsen and Blumenfeld processes. There is no finding and indeed no evidence that Barton-Rossi or Jebsen were commercially independent processes. On the contrary, the National Lead manufacturing process was founded on both (FF 37, R. 248). Moreover, that process was directly in conflict with and overlapped Blumenfeld patents, as illustrated by the genuine patent conflict which the Court found arose between du Pont and National Lead, holders of patents covering the respective processes and which eventually led to the cross-licensing agreement.[15]

---

[15] Thus, du Pont, following Commercial Pigments' practice, engaged only in pure TiO_2 manufacture until the middle of 1935 when it commenced composite pigment manufacture (Ex. 85, Ex. R. 4369). It followed the Blumenfeld method which entails as its essential feature the precipitation of high yields of TiO_2 from a so-called seeded or nucleated solution by boiling a titanium sulfate solution recovered from the sulfuric acid dissolution of an ilmenite ore (Ex. R. 3887). In such hydrolysis, it is essential to a commercially economical operation and product that a concentrated, rather than a dilute, titanium sulfate solution be used in the hydrolysis, and that in the production of such solution from the titaniferous ore a minimum amount of sulfuric acid should be used, i.e., less acid than is required to form normal salts of iron and titanium (Ex. 190, Ex. R. 1089-94). Precipitation of TiO_2 with the employment of concentrated solutions was covered by the Titan (Jebsen) Patent 1,288,863, dated December 24, 1918, to Fladmark, while Jebsen Patent 1,333,819, dated March 16, 1920, covered the use of less acid than required to form normal

POINT V.

IF COMPULSORY LICENSING IS ORDERED, DU PONT IS ENTITLED TO A RECIPROCAL LICENSE FROM ITS LICENSEES.

We are now assuming that this Court will affirm the provision for compulsory licensing. If so, the admitted purpose of compulsory licensing, *i.e.*, the removing of obstacles to competition in the industry, requires the principle of reciprocity. Otherwise, du Pont, although now one of the two leading American producers, could soon be at the mercy of, and wholly unable to compete with, its licensees. National Lead, the other leading American producer, would be subject to the same fate. If either Virginia Chemical or Zirconium undertook a policy of blocking and fencing, they might soon (while enjoying the benefits of the du Pont or National Lead patents) prevent these concerns from practising their own inventions.[16]

---

salts of iron and titanium in the ore dissolution. These Fladmark and Jebsen patents were infringed by the Blumenfeld operation of Commercial Pigments and du Pont in 1931 and 1933 Ex. 196, Ex. R. 1172-1174).

The Barton and Rossi method dominated composite TiO_2 pigment manufacture and is exemplified by patents such as No. 1,205,144 or 2,234,260, in which the hydrolysis or precipitation of the TiO_2 is effected in the presence of an extender such as barium or calcium sulfate to obtain a coprecipitated or extended form of TiO_2 pigment. (Ex. R. 3827, 3830) Since it is essential in the Barton process to resort to hydrolysis and the use of titanium sulfate solutions, the employment therein of the Blumenfeld "seeding" feature and of the Jebsen concentrated solutions and minimum amount of sulfuric acid in the ore dissolution to obtain the solution which is hydrolized, were equally essential to a commercially economical type of operation and to the production of a satisfactory grade of product.

[16]Examination of the colloquy between the District Court and counsel for the government leaves no doubt but that the

This is no mere hypothetical possibility. The record amply demonstrates that the other two existing American producers of titanium pigments, Virginia Chemical and

---

Court, and perhaps then the government itself, recognized the inherent unfairness of a system of compulsory licensing which did not involve reciprocity.

"THE COURT. What argument is there to be made in opposition to the proposition that if compulsory or free licensing is to be granted, that a reciprocal obligation from the beneficiary of that privilege should not be exempt? (R. 1272)

* * * * * * *

"MR. DIXON. May I ask this question? I do not understand whether your Honor was thinking along the line of having this on a royalty-free basis.

"THE COURT. Assuming royalty-free, why shouldn't it be perfectly proper, assuming royalty-free, that if Virginia Chemical wanted all the National Lead patents free, that Virginia Chemical should offer National Lead an equally free license on all of its titanium patents?

"MR. DIXON. I can see where that might have considerable merit, your Honor.

"THE COURT. And if it is on a stipulated control, modest royalty but compulsory, and if Virginia Chemical wants access to the du Pont patents, why shouldn't du Pont have the advantage of all the Virginia Chemical patents? Otherwise you will arrive at a situation conceivably where Virginia Chemical would simply change places with du Pont in becoming the dominating factor in the industry under this extraordinary advantage of being able to take everything for itself and keeping everything that it has.

"MR. DIXON. Well, if I understand your Honor's question, it is directed to the granting of royalty-free licenses by the defendants?

"THE COURT. No. I am suggesting it on both premises.

"MR. DIXON. I understand, or, in other words, to anyone who wants the use of these patents on a reciprocal basis.

"THE COURT. Of course, a new man going into the industry, probably he has not anything to offer anybody in return.

Zirconium, are both resourceful companies having powerful financial backing. Virginia Chemical was heretofore owned by the Interchemical Corporation, and has now been acquired by one of the most active and powerful chemical companies in the United States; American Cyanamid Corporation. Zirconium continues under the control of the important Glidden Company.

The District Court recognized that the effect of the government's argument is that although du Pont ought to be compelled to enable others to compete, its own capacity to compete with those others should be impaired. Such an argument could only be justified if the Court were imposing some punishment or penalty, regardless of the consequences upon the state of competition in the industry.

The government tries to build an argument out of the possibility that du Pont may have to license only under a "single patent", and that simultaneously its licensee "must surrender licenses under every patent" (125). This is a

---

"MR. DIXON. That is what I was about to come to.

"THE COURT. Ordinarily he would have nothing, but if he has it should he keep it as his exclusive property and get everything that his competitors have? There is a vast difference there.

"MR. DIXON. That is the situation that I was coming to, that someone else might come into the industry with no patents and he might be perfectly willing and probably would to assume that reciprocal obligation, and it might well be that the Government would be satisfied with that kind of arrangement, because here the ultimate purpose of this whole case, which has taken so much of your Honor's time and the time of everyone else, is to open up this industry to be certain that it is free and competitive and upon an equal basis, and so that there are no disadvantages foisted on anyone who wants to go into the industry, and on the suggestion that your Honor has made the Government might very well be receptive to it." (R. 1273-1274)

jaundiced way of reading the provisions in paragraph 7 of the decree that the licensee is entitled to select "any or all" of du Pont's patents that it wishes to be licensed under, and that du Pont then can select "any or all" of the patents of the other party under which du Pont wishes to be licensed (R. 313). The government ignores the fact that even if du Pont asks for a license under many or all of the other party's patents, du Pont will have to pay royalties thereon, and the other party will remain free to demand further licenses from du Pont during the operative period of paragraph 7. Any existing vice in the decree in this respect is not that du Pont is entitled to a license under "any or all" of the patents of a licensee when that licensee is demanding a license under "any or all" of the patents of du Pont, but that du Pont is deprived of the right to require others to license it unless they initially request a license from du Pont. The government completely overlooks this fact. Mutuality and open competitive opportunity is already impaired by the decree as it is, in so far as it prevents du Pont from initiating the negotiation to obtain a license under any patent they may issue in the future, for example, to American Cyanamid or the Glidden Company. Such a patent could obviously drive du Pont out of business.[17]

The government purports to find a different vice in the decree, saying that it enables some sort of "pool of patents" to be formed by the defendants from which others are excluded (125). This is a misconception, as it is based on the

[17]From du Pont's standpoint the injustice of the decree in this respect is particularly glowing as regards Zirconium (the Glidden Company). The party that subscribed to the "principles" of the cartel, and to all of its territorial restrictive provisions, is entitled to ask for a license from du Pont, but du Pont is not entitled to ask it for a license in the first instance.

old fallacy that the defendants are one; whereas whatever be one's views as to the prior position, there can be do doubt but that under the decree National Lead and du Pont will be independent and competitive. Du Pont, for example, will only have a pool of other patents to the extent that the others will have elected to ask it for its patents.

The government is correct in pointing out that there is no provision in the decree that third parties can compel each other to license (126). Although du Pont is compelled to license both A and B if they ask for licenses, and in turn is entitled to a license itself under A's and B's patents, neither A nor B can compel the other to license it. In this hypothetical situation, of course, A and B could at any time cross-license each other. But in any event the government did not raise the point below. If it had, the decree might have provided that any applicant for a license under du Pont's patents must give du Pont the right to sublicense such applicant's patents, if any, to third persons. The same could have been provided for in the case of National Lead patents. Or the decree could have provided that a condition of A or B licensing du Pont could be a requirement that A or B license all applicants. Perhaps this Court should so modify the decree. Manifestly the elimination of the reciprocity provision in the decree is not a fair way to resolve the hypothetical lacuna presented by the government.

The principle of reciprocal licensing has been adopted in consent decrees. See, for example, in Appendix B (pp. 10, 12) the decrees in *United States* v. *General Electric Company, Westinghouse Electric & Manufacturing Company*, C. C. H. Fed. Tr. Reg. Serv., Par. 52,777 (D. N. J. No. 1364 (1942)); *United States* v. *American Bosch Corporation*, C. C. H. Fed. Tr. Reg. Serv., Par. 52,888 (S. D.

N. Y. Civil Action No. 20-164 (1942)). The principle is conducive to competition in the industry, and this Court should approve it as a desirable method of implementing a compulsory licensing decree.

POINT VI.

THERE IS NO POSSIBLE WARRANT FOR AN ORDER OF DIVESTITURE OF PLANTS. THE WHOLE SUBJECT WAS THOROUGHLY CONSIDERED BY THE DISTRICT COURT, WHICH EXERCISED ITS DISCRETION BASED ON KNOWLEDGE OF THE RECORD AND AWARENESS BOTH OF THE LEGAL AUTHORITIES AND THE ECONOMIC THEORIES INVOLVED.

The record tells us nothing about du Pont's plants, and the government showed not the slightest interest in them until the hearing on the decree when this idea of divestiture suddenly occurred to its counsel. All that the record shows is that there is one plant at Baltimore, Maryland, and one at Edge Moor, Delaware. That knowledge comes to us from a single sentence in the testimony of Mr. Daley, du Pont's pigments manager (R. 1153), unaccompanied by any description of either plant.

When the divestiture issue was presented to the District Court, counsel for the government repeatedly urged that the proposition was wholly a matter for discretion (R. 1204, 1207, 1208, 1214, 1216). The District Court refused expressly to grant the relief, saying that his refusal was "*an act of discretion*" (R. 1286). The present view of the government that in a case such as this plant divestiture is mandatory can only be explained by the fact that the discretion which it is so clearly felt rested in the District Judge has been exercised contrary to the government's wishes.

This Court has repeatedly recognized the desirability of vesting wide discretion in the District Courts, so that Sherman Act decrees may be framed in the light of the variable factors which are always present in an anti-trust proceeding. Thus, in one of the most recent divestiture cases, *United States* v. *Crescent Amusement Company*, 323 U. S. 173, 185, this Court said: "We recognize, however, that there is a wide range of discretion in the District Court to mould the decree to the exigencies of the particular case and where the findings of violations are sustained we will not direct a recasting of the decree except on a showing of abuse of discretion." See also *Ethyl Gasoline Corporation* v. *United States*, 309 U. S. 436, 461; *United States* v. *Bausch & Lomb Co.*, 321 U. S. 707, 725, 728, and *Associated Press* v. *United States*, 326 U. S. 1, 22.

The underlying reason for this view, which the government here apparently ignores, was stated by Mr. Justice Rutledge in his dissenting opinion in *Hartford-Empire Co.* v. *United States*, 323 U. S. 386, 441, when he said:

> "* * * The reasons which thus ordinarily restrict the scope of appellate review have magnified force in anti-trust proceedings. Their complex character usually requires, as in this case, months or years for the trial court's consideration. With its maximum attention, this Court cannot possibly attain the same detailed familiarity with the cause. Nor can it frame at long distance, with the same assurance, a decree adequate for the necessity."

Indeed, whether divestiture or dissolution should be ordered in a particular case is peculiarly a subject for the District Court's discretion, involving as it does an appraisal which the trial court is obviously in a better position to make than an appellate court.

(1) The Facts:

The following uncontroverted facts in this proceeding establish the inappropriateness of plant divestiture:

1. While both monopoly and attempt to monopolize were charged, the District Judge refused to find any violation of Section 2 of the Act.

2. There is no evidence that du Pont illegally acquired titanium pigment plants or the assets or business of any titanium pigment manufacturer. Du Pont's only acquisition was made to enable its entry into the business, and long before it is even claimed to have entered the combination.

3. Du Pont is not the largest producer of titanium pigments in the United States. As of the date of the decree du Pont manufactured and sold only 35.4% of the titanium pigments made and sold in the United States.

4. In addition to du Pont there are three other manufacturers of titanium pigments doing business profitably in the United States: National Lead; Zirconium, a subsidiary of the Glidden Company; and Virginia Chemical Company, a subsidiary of American Cyanamid Company. All of these large and financially substantial companies will have access to du Pont's patented inventions.

5. Du Pont competes with these three manufacturers for customers through sales efforts and by improvement of quality and by development of new products. There is not now nor was there ever any price agreement, division of territory or allocation of customers as between the four United States competi-

tors. Additional competition is provided by substantial manufacturers of other forms of white pigment.

6. There is no evidence that du Pont ever refused to license its patents or technical information to any other existing or potential United States manufacturer of titanium pigments, and du Pont has no control over the supply of raw materials used in the manufacture of titanium pigments.

7. Throughout the period of the alleged combination prices have declined substantially.

8. Production of all manufacturers has increased consistently since the industry became established in 1931.

The facts summarized above are considered at greater length in our main brief in No. 91. They present a compelling picture of competition in the titanium pigment business within the United States and a complete absence of monopolistic combination.

The government says that du Pont's plants are "strategically located" (53), but gives no record reference for its statement; and it is indeed unsupported in the record. While the record does show that du Pont has two plants equipped to manufacture at least some of its line of titanium pigment products, it does not show any of the following as to du Pont's titanium pigment plants, or indeed as to the plants operated by National Lead:

1. The capacity of titanium pigments plants.

2. Whether the plants manufacture either pure titanium pigments or composite titanium pigments or both; and if the latter, in what proportion

3. Whether other products are manufactured in any of the plants.

4. The extent to which the du Pont plants, for example, are interrelated in their manufacture of titanium pigment products.

5. The effect that dismemberment or complete divestiture would or might have upon

(a) Cost of manufacture;

(b) Capacity to manufacture;

(c) Quality of products manufactured;

(d) Efficiency of operations;

(e) Ability adequately to serve the consumer.

6. The plant capacities of Zirconium and Virginia Chemical.

7. The plans of the four manufacturers for the increase or decrease of manufacturing capacity.

8. The relative efficiency of the two smaller producers; their comparative costs of production, etc..

9. Whether any other concerns are anxious or willing to enter the titanium pigment business.

The state of the record, which is suggested by the foregoing, reflects the primary purpose of the government to punish the defendants. The government was not interested and made no effort to bring before the Court economic data upon which a sound judgment might be made on the delicate questions of competitive balance, which any request for

divestiture relief suggests. *Indeed, it did not even seek findings on the divestiture issue.* Rather the government bluntly urged that both du Pont and National Lead be divested of all their plants (R. 178-179). This was the flat punitive position taken, and it was not until the Judge's views had been made clear (albeit tentatively) in the course of the discussion of the decree, that the government retreated to its present position—that one plant should be divested from each defendant. That position had evidently not been at all thought out.

Against this background, we may again consider du Pont's participation in the conspiracy here alleged. The only acquisition made by du Pont, that of Commercial Pigments, was made in 1931, substantially before du Pont is even alleged to have entered the conspiracy or combination. That acquisition was never criticized or put in issue at any stage of the case, for the very obvious reason that du Pont had not previously been engaged in the business at all and was only enabled to enter it by that acquisition, so that in effect the new concern was the same as the old.[18]

This case was only indirectly concerned with the domestic titanium pigment market. It involved almost entirely territorial cartel restrictions on foreign trade. And what du Pont was found by the Court to have done, was to have given an assurance to the Cartel on an international territorial question, and to have exchanged patents and technical information with National Lead. The decree enjoins against continuation of the territorial understanding and breaks down completely the patent ties between du Pont and

[18] Du Pont did not, however, assume the contractual obligations of Commercial Pigments, as du Pont acquired its assets only, for a consideration (FF 88, R. 300).

National Lead, at the same time making the patents available on reasonable terms to all applicants. The District Judge was conscientiously moulding his decree, subject to the law as theretofore settled by this Court, to a remedy of the evils which he himself found had existed.

(2) The Legal and Economic Principles:

Dismemberment or divestiture of plants is, of course, in the last analysis, merely another form of dissolution. Dissolution, while rarely ordered, has been utilized in the shaping of certain particular types of anti-trust decrees. Where violation arises out of an acquisition of plants or of competing units, or out of a tying together of different corporate interests through stock holdings or merger, the remedy of dissolution has been considered. These cases traditionally present the problem of breaking apart corporate or property aggregations which were in actual fact unlawfully created in whole or in part. Such integrations constitute illegal combinations, and the courts have been willing to utilize the drastic dissolution remedy as the only method of preventing a continuation of the actual violation.

This is after all merely an application of the ultimately governing rule in all anti-trust relief,—as stated in the opening of the argument in the government brief and of this reply,—that the judgment must be moulded to the exigencies of the particular case.

The rule and supporting cases are set forth succinctly in the opinion of this Court in *United States* v. *Crescent Amusement Company*, 323 U. S. 173, 189:

> "Dissolution of the combination will be ordered where the creation of the combination is itself the violation."

Even in such instances, however, the courts have, because of the property rights necessarily involved and the obvious disservice which will result to the public from breaking up aggregations which have demonstrated their efficiency, cautioned against utilizing the remedy except where clearly required to prevent violation and to dissolve and neutralize the illegality. *Standard Oil Company of New Jersey* v. *United States*, 221 U. S. 1, 77; *United States* v. *Aluminum Company of America*, 148 Fed. (2d) 416, 446; *United States* v. *Pullman Company*, 53 F. Supp. 908. Indeed the language of the *Crescent Amusement* case suggests that a District Court is wholly without power to order divestiture against even a unified company whose existence is wholly lawful, a suggestion substantially reinforced by the fact that no court has ever exercised such power.

The government and the District Court clearly recognized on the trial below that the dissolution relief asked by the government in this instance would have gone far beyond anything that has been heretofore sanctioned. Thus, the following colloquy between the Court and government counsel appears at R. 1208:

> "The COURT: * * * Here is what I want to know. I take it from your comment that there is no precise precedent in which a court has taken a corporation and split it in two, or in four, where that corporation had not illegally become the product of four or three or more units, That does not put you out of court. It may be there is no precedent, because the event has not occurred. You would be in worse shape if such events had occurred and the courts refused on principle to do it.

"You may argue that proposition, or argue that as a matter of reason and logic the court should do it; therefore that takes you back to the question, is there any case which says that it is the function of the court to create competition rather than to create opportunity for competition, or to eliminate the obstacles to competition.

"Mr. DIXON: Offhand I can give your Honor no such case. In other words, in that sense, we are here asking your Honor on the broad grounds of discretion, to exercise your discretion——

"The COURT: You are dealing with a matter of relatively first impressions.

"Mr. DIXON: That is right, and that is our position here on this matter. * * *"

Nor is there any valid economic argument to support the government's novel contention. The government bases its economic argument upon phrases,—that National Lead and du Pont are "duopoly", and that "the defendants" control the industry (132-133). As to the first, the government ignores the other two already existing manufacturers, both of which are strong and vigorous. As to the second, it ignores the fact that the District Court refused to find "joint control", but expressly found control only when the defendants were added "together" through the agreements reached between them. The Court in its decree struck down these agreements. With the agreements gone, du Pont and National Lead each stand alone as independent concerns. They are no longer "together".

After suggesting that this case is "not unlike" the *Aluminum* case, 148 F. (2d) 416,—a proposition which is without support, as the Aluminum Company was a single integrated concern,—the government brief (133-134) indulges

in a veritable riot of speculation. It says that the defendants [*sic*] "will utilize to the fullest every advantage"; that they "*unquestionably*[19] will adopt policies designed to prevent outsiders from capturing any portion of the market"; that "the emergence of any, or at least substantial, competition within any foreseeable period is *unlikely*"; that "the existing industrial pattern will *probably* continue"; that "*economic studies* have demonstrated that when two great corporations completely dominate an industry there is *no incentive* for the two corporations to compete with each other"; that such control "*inevitably* has the same basic characteristics and the same ultimate effects as monopolization of an industry by a single corporation"; that "price uniformity resulted from the duopoly even though the lower court found no evidence of express agreement on prices"; that "without divestiture * * * the premium of 'price stability' becomes *a necessity* in the eyes of the management"; that "it ignores the realities *inherent* in the concentration of economic power possessed by these two defendants"; for their "course of conduct over a period of years is too long engrained in the business attitudes of the management"; and that "the titanium industry is only an isolated instance of the dangerous *trend* toward concentration of economic power in the hands of a few industrial giants".

Picking our way through this labyrinth of conjecture, we discern the following statements of supposed fact:

(i) there is price stability;

(ii) there is a course of conduct of these two defendants engrained in the business attitudes of the management;

---

[19]Italics ours in these quotations.

(iii) price uniformity resulted from this duopoly.

These propositions are all definitely negatived by the findings and the record:

(i) There was no "price stability". The Judge found that there were "repeated reductions in the price of titanium pigments * * * and a very few increases" (FF 78, R. 290).

(ii) As to the "course of conduct * * * long engrained in the business attitudes of the management", the District Court found it to be one of competition which the record shows was "plenty tough" (R.1158).

(iii) Price uniformity, as we have already explained, is universal in economic experience when dealing in products that are sold, not to consumers, but to large manufacturers with expert buying departments. The judge expressly found, as the government recognizes, that there was no evidence that the prices were the product of agreement or collusion between National Lead and du Pont (FF 78, R. 291). The officials of the two companies, who took the stand and submitted themselves to cross-examination, testified that price announcements were not made concurrently (R. 1150) but rather that one party had to meet competitively any reduced price fixed by the other, and that there was no arrangement, agreement or understanding of any kind on the subject (R. 1077, 1168).

Essentially, the government's arguments are the general traditional arguments against bigness as such. We see no need to take sides on this question. We leave that to Con-

gress, and wish to point out only that in this very case those arguments, whatever their validity, were vigorously urged before the District Court at the time divestiture relief was requested. If space permitted, we would like to set forth in full the colloquy between the Court and government counsel on this question which appears at R. 1194 to 1219. The District Judge showed himself learned in economic theory and conscientiously aware of the social implications which necessarily derived from a Sherman Act decree. He considered the government's economic arguments at length. His very questions, succinctly stated, and the responses he received from government counsel, show not only his awareness of the economic problems but the complete inability of fitting the government's economic theories to the law and facts of this case. For example (R. 1212-18):

> "The COURT. * * * why should not we take advantage of the circumstances here in making our choices? We have four corporations. Why should not we say '* * * That is much better than if we only had one. It has solved one of our problems. That monolith has been broken into four; two big and two little ones. We do not know which is better. We do not know the optimum size for competition. Here we have an opportunity for genuine experimentation; two big ones and two little ones. All we want to make sure is that there is no deal inside here which would destroy the effectiveness of the competition and we want to make sure that in future the door shall not be closed as it was in the past, and we want to make opportunity free.' * * *"
>
> * * * * * * * *
>
> "The COURT. Then you come to the problem of where should you stop. Clearly, if we had ten or

twelve corporations, we might have more competition than if we had four or six. Yet you do not suggest formation of ten or twelve because you think that would be an unreasonable fragmentation of the situation we have here. Why is not four an adequate fragmentation, and why is six so much superior to four when you have the advantage that the four are available breathing institutions whereas the six you would have a situation where at least four of them would be newly born institutions?"

* * * * * * * *

"The COURT. * * * does it follow that little Virginia Chemical cannot effectively compete with big du Pont, assuming that it was under no obstacles? Is that the fact? I mean I do not know. I have not read any economists who say that such is the fact. I have read some professors who say that but I have not seen that. Isn't it true that little corporations efficiently managed can effectively compete with big corporations?"

* * * * * * * *

"The COURT. * * * Is there anything to indicate the consumer cannot get at least as efficient service out of the little corporations as well as the big ones?"

* * * * * * * *

"The COURT. What I am trying to get at, if we are going to have a check-up that will limit size, as such, maybe the Congress should do that directly and not have equity courts determining what the optimum size should be for a competing business. I don't know the solution. I do not know that the courts are qualified to find the answer to it."

* * * * * * * *

"The COURT. * * * let us suppose that Standard Oil acquires one of those companies and the other company is acquired by a new outgrowth of.

small private entrepreneurs: Standard Oil has a large chemical division, and great big laboratories and so on, and unlimited sources of capital and pretty soon it has extended its competitive capacity to three or four times its present size and it then occupies eighty or ninety per cent of the field. * * *"

* * * * * * * *

"The COURT. Just let us suppose you had furious competition. I am assuming that the five other companies that will emerge out of this reorganization would be of Simon pure character and all be staffed by ex-officers of the Department of Justice with an eye single to the preservation of the pure competitive system. Now nevertheless Standard Oil has tremendous capacity and it achieves a condition of eighty per cent of the industry. Is there anything you can do about it under the law as it presently stands.

"Mr. DIXON. I would say no, your Honor."

* * * * * * * *

"The COURT. * * * Assuming that the law is that in an appropriate case you can do what you say should be done here, is this the kind of a case in which that principle should be applied? In other words, what are the criteria when the shrinking down should be done as you suggest?

"Mr. DIXON. To specifically answer your question on that point of the case, we submit that it should be done where the obvious position in the industry of the companies involved is such that that fact in and of itself might reasonably tend to deter other companies from coming into the industry or new capital from coming into that industry.

"The COURT. Now let us see. Let us hold on a minute. Let us suppose that instead of two companies which we are now dealing with, this was a

combination of the four or five big and powerful enterprises, and they had jointly dominated the industry in the sense that those five occupied the fields to the extent of ninety per cent of the consumed products. Now you break up the combination. You sever the bonds which unite those five. There is no doubt that they had grown big, powerful and rich by virtue of illegal law violation. Would you say that in that case we should shrink each of the five down because in view of the magnitude of those five the chances of new competitors entering the field are not as good or at least you surmise they are not as good, as they would be if each of those five was shrunken down to half its size?

"Mr. DIXON. If you had those five companies in the industry and they were approximately on an equal basis as far as ability to compete in the sense of productive capacity and so on was concerned, customers and position in the industry, I would say that would be satisfactory, the object being to create——.

"The COURT. Competition?

"Mr. DIXON. That is right.

"The COURT. What principle of law, or what rule of economics is there which suggests that competition among five is necessarily superior to competition among two?

"Mr. DIXON. None, your Honor."

(Page 1262 of the Record.)

Apart from these considerations, the government's suggestion that there is something implicitly illegal in du Po. owning and controlling a productive capacity for titanium pigments representing approximately 35% of the

whole,[20] an amount less than its percentage before 1933, finds no support in the decisions of this Court. As Justice Cardozo stated in *United States* v. *Swift & Co.*, 286 U. S. 106, 116:

> "Mere size * * * is not an offense against the Sherman Act unless magnified to the point at which it amounts to a monopoly * * *."

This language was cited with approval in the recent *Aluminum* decision by Judge Hand, who went on to point out that under the decided cases it is doubtful whether 60% or 64% is sufficient to establish monopoly, and that "certainly 33% is not enough". Reflecting this same view are the decisions of this Court, which has refused, after consideration, to order dissolution even where a showing of violation of the Act, accompanied by a substantial percentage of market control, is indubitably established. In *United States* v. *United States Steel Corporation*, 251 U. S. 417, a corporation controlling approximately 50% of the steel industry was held not to be in violation of the anti-trust acts and dissolution was refused. Again, in *United States* v. *International Harvester Company*, 274 U. S. 693, the Court refused to grant further relief upon a showing by the government following a consent decree that the defendant still controlled 64% of the United States market, which was charged to constitute a monopoly and restraint

---

[20] The government, by its erroneous statement that newcomers or competitors are presently without the benefits of an expanding demand, implies that such position as du Pont now enjoys is apt to be frozen because newcomers would be faced by a saturated demand and capacity in the defendants to supply it. In fact, however, in spite of constant efforts to meet demand, the condition of the industry is one of constantly increasing demand requiring new capacity (Ex. R. 4397-8, R. 1161-5).

of trade. The lower courts have also acted consistently with these decisions in refusing to order dissolution, in spite of proof that substantial market control existed.

There are numerous other cases to the same purport, to-wit: *Standard Sanitary Manufacturing Company* v. *United States*, 226 U. S. 20; *United States* v. *Keystone Watch Case Company*, 218 Fed. 502 (E.D. Pa.), app. dism. mo. United States, 257 U. S. 664; *United States* v. *New England Fish Exchange*, 258 Fed. 732 (D. Mass.); *United States* v. *American Can Company*, 230 Fed. 859 (D. Md.), 234 Fed. 1019 (D. Md.), app. dism. mo. United States, 256 U. S. 706; *American Press Association* v. *United States*, 245 Fed. 91 (C. C. A. 7th). In all of these cases units of combinations found to be in violation of the Sherman Act and constituting substantial proportions of the total capacity, often in excess of 50%, have not been subjected to divestiture of physical property in any form.

Finally, we will deal briefly with the only other argument seriously advanced on the divestiture issue by the government. This is the contention that Congress has not authorized District Judges to enter regulatory decrees in Sherman Act proceedings, and that the District Judge accordingly should have simply entered an order divesting du Pont of at least one of its plants (140). We will not burden this brief with reference to numerous District Court decisions in anti-trust cases which are far more regulatory and complex than the decree here. District Judges, with the full approval of this Court, have consistently undertaken to regulate aspects of the business of concerns found in violation of the Act, and this has been traditional in the judicial administration of the Act. In fact, the government itself has frequently been party to just such decrees, as will be

found from an examination of numerous recent consent decrees.

Moreover, the notion that divestiture or plant dismemberment requires less regulatory action than the present decree is certainly difficult to comprehend. Quite the contrary is the case. The District Judge in fact recognized the administrative and regulatory difficulties which the government's proposal created when, in the discussion of the proposed decree, he said at R. 1206:

> "But have we gotten to the point where an equity court has to authorize stock issues and formulate capital structures and arrange bond issues and stock issues and determine their relative amounts and select boards of directors and then, having created business entities, order them to go into the market and compete?"

Respectfully submitted,

WM. DWIGHT WHITNEY,
Counsel for Appellee E. I. du Pont de Nemours and Company,

APPENDIX A

Correspondence Between National Lead and Du Pont

June 4, 1946

Mr. J. F. Daley, General Manager
Pigments Department
E. I. du Pont de Nemours & Company
Wilmington, Delaware

Dear Mr. Daley:

We have given careful consideration to the matter of compliance with the directions of the Decree of October 11, 1945, with regard to granting licenses under titanium patents. We have concluded to proceed in this manner:

We shall offer to grant licenses under our patents, as defined in Paragraph 4 of the Decree, at uniform reasonable royalties as follows:

1. In the case of any applicant having no patents demanded by either National Lead Company or Titan Company, Inc., under Paragraph 7 of the Decree, either

(a) a royalty at the rate of one per cent (1%) of the value of the applicant's production based upon the published carload prices for the grades of pigments manufactured under the patents; or

(b) a single royalty payment deemed to approximate the total value to the applicant of the patents of National Lead Company and Titan Company, Inc., as so defined.

2. In the case of any applicant having patents demanded by either National Lead Company or Titan Company, Inc., no royalty in exchange for a license under applicant's patents.

It is recognized that any arrangements made for licenses in accordance with the foregoing may be modified to conform to or as may be permissible under the decision of the Supreme Court on the pending appeals from the above mentioned Decree.

Yours very truly,

C. F. GARESCHE
Manager

June 14, 1946

Mr. C. F. Garesche
Manager, Titanium Division
National Lead Company
111 Broadway
New York 6, New York

Dear Mr. Garesché:

This will acknowledge and thank you for your letter of June 4th, advising of the procedure which the National Lead Company and Titan Company, Inc. have adopted for licensing the TiO_2 patents owned by each under the Titanium Decree.

As you know, Mr. Kaegebehn had previously informed us that National Lead would desire licenses under du Pont patents. Since we also wish to acquire licenses under National's patents, it would appear that you consider us to be under Category 2 of your letter. However, licensing on a royalty-free exchange basis does not appear feasible, nor is it acceptable to us. In our view, the royalty rate is dependent upon the importance of the patents under which each party will become licensed. We do stand ready to undertake negotiations for effecting the desired grants and on a basis which is consistent with the terms of the decree.

If, therefore, you will set a date for a meeting, we will be glad to have our Messrs. Hancock and Booge meet and confer with your representatives and negotiate terms of license.

Very truly yours,

J. F. DALEY

June 28, 1946

Mr. C. F. Garesche
Manager, Titanium Division
National Lead Company
111 Broadway
New York 6, New York

Dear Mr. Garesché:

Supplementing our letter of June 14, 1946, which replied to yours of June 4, 1946, we now write to notify you that, pursuant to the provisions of Paragraph 7 of the Final Decree, dated October 11, 1945, in United States v. National Lead, et al., we wish to acquire a non-exclusive license effective commencing July 11, 1946 and terminable by us upon reasonable notice, under each of the following National Lead Company United States patents:

Washburn	1,889,027	dated	Nov. 29, 1932
Washburn, et al.	2,222,385	"	Nov. 19, 1940
Cole, et al.	2,280,795	"	Apr. 28, 1942

We also wish to inform you that we do not expect to operate under Washburn No. 1,889,027 for more than a period of six months. The Washburn No. 2,222,385 and Cole, et al. No. 2,280,795 relate to but a portion of our present pigment production.

Accordingly, we would appreciate receiving from you at an early date license agreement in form for our execution.

Yours very truly,

J. F. DALEY
General Manager

July 8, 1946

Mr. J. F. Daley, General Manager
Pigments Department
E. I. du Pont de Nemours & Company, Inc.
Wilmington, 98, Delaware

Dear Mr. Daley:

We have your letter of June 28 supplementing your letter of June 14, 1946 and note that you desire to acquire a non-exclusive license effective July 11 under certain National Lead Company patents.

You must realize that the proposals contained in your letter of June 14 and 28 are not responsive to the offer described in our letter of June 4, which was based upon careful consideration of the decree dated October 11, 1945. In our opinion it is impossible to evaluate each patent as suggested in your letter of June 14. In the case of du Pont and other manufacturers having patents desired by our company, we think the terms and purpose of the decree can be carried out only by a royalty free exchange; in the case of manufacturers having no patents, licenses must be granted at a royalty which will clearly permit competition.

Consistent with the foregoing, we desire licenses from and after July 11 under the du Pont patents described in paragraph 4 of the decree.

Very truly yours,

C. F. GARESCHE
Manager

Mr. C. F. Garesche
Manager, Titanium Div.
National Lead Company
111 Broadway
New York City, N. Y.

July 11, 1946

Dear Mr. Garesche:

In reply to your letter of July 8, we must again state that we consider a royalty-free exchange wholly inconsistent with the decree of October 11, inasmuch as such an exchange would result in a continuation of the very agreement which the court has ordered cancelled. We are, however, prepared to license you under the patents described in paragraph 4 of the decree—as to which your letter indicates you desire licenses—at a royalty rate of two per cent of the value of your production based upon your published carload prices for all grades of pigments manufactured under any of these patents. We feel that this rate of royalty, which is consistent with our other existing licenses, is entirely reasonable and, to use your phrase, "will clearly permit competition."

In our letter of June 28, we requested a license from you under only three specified patents. Certainly an evaluation of these three patents presents no serious problem, and we stand ready to pay whatever reasonable royalty rate is established by you consistent with the decree for the licensing of these patents.

Inasmuch as we are entitled to a license under the patents in question pursuant to the terms of the decree, we propose to proceed on the assumption that we are licensed under the patents and, of course, will make retroactive to today's date whatever royalty is finally determined upon.

Yours very truly,

J. F. DALEY
General Manager

September 13, 1946

Mr. C. F. Garesche
Manager, Titanium Division
National Lead Company
111 Broadway
New York 6, New York

Dear Mr. Garesche:

Confirming what was indicated generally by Messrs. Provost and Gesell in their recent conferences with Messrs. Williamson and Webster with respect to the respective requests of du Pont and National Lead for licenses under each other's titanium pigment patents, please be advised as follows:

1. Pursuant to paragraph 7 of the Final Decree dated October 11, 1945, in *United States* v. *National Lead, et al.*, we hereby offer to grant to you a non-exclusive license, terminable by you at will, under such of our patents and patent applications listed in Section VI of the Appendix to such Final Decree as you desire, at a non-cumulative royalty of 2% of the value of your production of pigments manufactured under the licensed patents, such value to be based on your published carload prices for the particular grades of pigments involved.

2. Also pursuant to such Final Decree, we hereby request that you grant to us a non-exclusive license, terminable by us at will, under the following United States Letters Patent:

Washburn	No. 1,889,027
Washburn	No. 2,222,385
Cole et al	No. 2,280,795

We offer to pay for such license a non-cumulative royalty of 1% of the value of our production of pigments manufactured under the licensed patents, such value to be based on our published carload prices of the particular grades of pigments involved.

We understand you contemplate bringing this matter before Judge Rifkind in the near future, since you are not willing to accept a license from us on the terms outlined above or to license us under your specific patents on the basis we have requested. As we have advised we consider your proposals for licensing prohibited by the decree and, for this as well as other reasons, they cannot be accepted by du Pont.

Very truly yours,

J. F. DALEY
General Manager

September 18, 1946

Mr. J. F. Daley, General Manager
Pigments Department,
E. I. du Pont de Nemours & Company,
Wilmington, 98, Delaware

Dear Mr. Daley:

Your letter of September 13th addressed to Mr. Garesche has been received.

Mr. Garesche is out of town, but as soon as he returns, it will be brought to his attention.

Yours very truly,

SECRETARY TO MR. GARESCHE

APPENDIX B

Consent Decrees Containing Reasonable Royalty Clauses

The following consent decrees are reported in C. C. H. Federal Trade Regulation Service:[1]

(1) Before the *Hartford-Empire* case

Par. 52,768. *United States* v. *Standard Oil Company* (*New Jersey*) D. N. J. March 25, 1942.

"IV [Activities Enjoined]

"The defendants * * * are * * * directed and required:

[Issuance of Licenses and Sublicenses]

"(5) to issue licenses or sublicenses, or to direct and compel the licensing agency to so do, on the request of any person or corporation, under the S. I. G. patents and under the Jasco patents, without restriction as to the products to be treated or manufactured or as to the technique to be employed or as to the use to be made of such patents, or as to the price to be charged for any of the products manufactured under such licenses or sublicenses, and without any other restriction whatsoever, save that *reasonable royalty rates*[2] may be charged under said licenses or sublicenses in connection with operations after the present emergency, for the duration of which said licenses or sublicenses shall be royalty free; * * *." (Certain provisos follow.)

[Furnishing "Know-How" with Patent License]

"(6) to furnish with all licenses issued under paragraph (5) above know-how without compensation therefor,

---

[1]We have reason to believe that these cases are examples only, and that there were additional such cases, unreported.

[2]Italics in quotations are ours.

save that the cost of furnishing know-how may be recovered from the licensee, which cost shall include the value of the time spent by defendant's personnel in furnishing said know-how, and save that a *reasonable compensation* may be received for know-how furnished with licenses under Butyl patents."

[Revision of Existing Patent Licenses to Conform to Royalty Provisions of Decree]

(7) This paragraph provides for the above.

[Requirements with Respect to Patents and Licenses under Other Agreements]

(8) With regard to patents title to which or the right to license thereunder is held under the terms of certain named agreements defendant is required for the present emergency to issue licenses to applicants in accordance with the terms of such agreements and after the termination of the present emergency to issue licenses for which *reasonable royalty* rates may be charged.

Par. 52,927. *United States* v. *Standard Oil Company (New Jersey)* D. N. J. Civil Action No. 2091. April 7, 1943.

This decree supplemented the above decree by providing that the compulsory licensing provisions of that decree apply to catalytic refining patents although a *reasonable royalty* may be charged.

Par. 52,777. *United States* v. *General Electric Company, Westinghouse Electric & Manufacturing Company*, D. N. J. No. 1364. April 10, 1942.

"IV [Free Licensing of Patents and Conditions Therefor]

"Defendant Westinghouse, its directors, * * * are * * * required to issue non-assignable licenses

or sub-licenses upon the request of any person under all patents relating to lamps, lamp parts, or lamp machinery, royalty-free and without restrictions to the products to be treated or manufactured, or as to the technique to be employed or as to the use to be made of such patents, or as to the price to be charged for any of the products manufactured under such licenses or sublicenses, and without any other restriction whatsoever, save (1) that a *reasonable royalty* may be charged under said licenses or sublicenses if the licensee or sublicensee does not agree reciprocally to license the defendant Westinghouse upon a royalty-free basis * * *."

Par. 52,776. *United States* v. *Aluminum Company of America*, S. D. N. Y. April 15, 1942.

[Charge of Royalties Permitted at Termination of "Present Emergency"]

"(b) At the termination of the 'present emergency,' each of the corporate defendants and its affiliates shall, upon the written request of any applicant, grant to such applicant, including any of the defendants herein, a non-exclusive, non-assignable right to use, manufacture and sell under any and all 'production patents' where the patent or application therefor was owned by it on the date of the entry of this decree without any conditions or restrictions whatsoever, except such suitable restrictions as may be necessary pursuant to U. S. C. Title 35 Para. 49, 44 Stat. 1058, save that a *reasonable and non-discriminatory royalty* may be charged therefor * * *."

Par. 52,888. *United States* v. *American Bosch Corporation*, S. D. N. Y. Civil Action No. 20-164. December 29, 1942.

IV [Unrestricted Patent Licenses to be Granted]

"Defendant American Bosch is hereby ordered and directed:

"A. In connection with:

"(1) All United States letters patent issued on or before the entry of this judgment,

"(2) All applications for United States letters patent filed on or before the entry of this judgment and all patents issued pursuant to such applications, and

"(3) All divisions, continuances, renewals, reissues, or extensions of the patents and applications described in Clause (1) and in Clause (2), owned or controlled by it or over which it has or may have the required legal power and to the extent to which it has such power, to grant to any applicant therefor absolutely unrestricted licenses or sublicenses to manufacture, use, and sell without any conditions except that *a reasonable and nondiscriminatory* royalty may be charged in connection with operations after the present emergency, for the duration of which such licenses or sublicenses shall be royalty free, * * *." (Certain provisions are made to require payment of *reasonable royalty* by non-reciprocating licenses whether during emergency or thereafter and in a certain situation not to require Bosch to license such non-reciprocating licensee at all.)

(2) After the *Hartford-Empire Case.*

Par. 57,336. *Crosby Steam Gage & Valve Company* v. *Manning, Maxwell & Moore, Inc. United States, Intervenor-Defendant.* D. Mass. Civil Action 2267. Feb. 1, 1945.

"5. Crosby Steam Gage & Valve Company * * * is required

* * * *

"(b) to issue to any applicant, *at a reasonable royalty,* and without any restriction whatsoever, for the period, if any, included between the end of the present emergency and January 14, 1947, a license to make, use and vend the embodiments of the inventions covered by any of said Crosby relief valve patents which may be unexpired during such period."

(Crosby relief valve patents are certain patents issued in 1928 and 1930, and reissues, extensions and renewals thereof).

Par. 57,492. *United States* v. *American Air Filter Company, Inc.,* W. D. Ky. Civil Action No. 574. Sept. 10, 1946.

"IV [Licensing Directed]

"Each of the defendants is hereby ordered and directed:

* * * *

"(b) to grant to any applicant making written request therefor a non-exclusive license to manufacture, use and sell under any one or more of the United States Letters Patent and the patents issued upon applications for United States Letters Patent, the patent numbers and application numbers of which are listed in Schedule C attached hereto * * * with-

out any condition or restriction whatsoever, except that *a reasonable and non-discriminatory royalty* may be charged * * *."

"(c) to grant to any applicant making written request therefor, to the extent that the defendants now have or acquire the power to do so, a non-exclusive grant of immunity from suit under any foreign patents or patents issued on foreign applications for patents, corresponding to the United States Letters Patent or applications for patents listed in Schedule C to import into and sell or use and to have imported, sold or used in any country products made in the United States, without any condition or restriction whatsoever, except that *a reasonable and non-discriminatory royalty* may be charged * * *."

(Patent or patent application includes continuations, renewals, etc.)

Par. 57,444. *United States and Alien Property Custodian* v. *Bendix Aviation Corporation*, D. N. J. Civil 2531. Feb. 13, 1946.

"V [Patents to Be Transferred to Alien Property Custodian; Grants of Immunity; Licensing].

"Bendix, its officers, directors, * * * are ordered and directed:

* * * * *

"(C) To grant to any applicant making written request therefor, to the extent that Bendix and its subsidiaries now have or acquire the power to do so, a non-exclusive license, sub-license or immunity to manufacture, use and sell under any one or more of the United States Letters Patent and the patents issued under applications for United States Letters Patent, the patent numbers and application numbers

of which are listed in Schedule B attached hereto * * * without any condition or restriction whatsoever, except that *a reasonable and non-discriminatory royalty* may be charged * * *.

"(D) To grant to any applicant making written request therefor, to the extent that Bendix and its subsidiaries now have or acquire the power to do so, a non-exclusive grant of immunity from suit under foreign patents or patents issued on foreign applications for patents, corresponding to the United States Letters Patent or applications for patents listed in Schedule B to import into and to sell or use, and to have imported, sold, or used, in any country products made in the United States, without any condition or restriction whatsoever except that *a reasonable and non-discriminatory royalty* may be charged, * * *."

(Patent or patent application includes continuations, renewals, etc.)

Par. 57,456. *United States* v. *The Diamond Match Company*, S. D. N. Y. Civil No. 25-397. April 9, 1946.

"14. Defendant The Swedish Match Company is directed to grant to any applicant therefor a non-exclusive, non-assignable and unrestricted license to make, use and sell, save for *a uniform, reasonable royalty*, under any patented invention of The Swedish Match Company, its subsidiaries, successors, assigns or nominees, conceived within five years after the date of the entry of this judgment relating to everlasting or re-ignitible matches. * * *"

Par. 57,448. *United States* v. *General Electric Company, Corning Glass Works*, D. N. J. Civil Action Nos. 1364 and 2590. March 7, 1946.

"VIII Defendant Corning be and hereby is directed to grant to any applicant making written request therefor a non-exclusive, non-assignable and unrestricted license, save for and at *a uniform reasonable royalty,* under any or all future patents to make or have made, use and sell glass bulbs, tubing, cane or lamps, and to make or have made glass machinery, and to use such machinery for the production of glass bulbs;" (not required to grant such licenses to defendant General Electric Company, however).

(Future patents includes only those applied for on or before January 1, 1950 and all divisions, continuations, extensions or reissues thereof.)

Par. 57,489. *United States* v. *Libbey-Owens-Ford Glass Company,* N. D. Ohio Civil Action No. 5239. Sept. 5, 1946.

"VI [Licensing Directed]

"Defendant Corning be and hereby is directed to grant to any applicant making written request therefor a non-exclusive, non-assignable and unrestricted license, save for and at *a uniform and reasonable royalty,* under any and all of the patents enumerated and described in the schedule hereto attached and marked 'Schedule A,' to use the inventions of said patents for the production of flat glass. Said patents have not heretofore been used in the flat glass industry or licensed by Corning for use in said industry. * * *"

Par. 57,498. *United States* v. *Owens-Illinois Glass Company*, N. D. Cal. Civil Action No. 25861-C. Sept. 18, 1946.

"V. [Granting of Licenses Ordered]

"A. Defendant Owens by and hereby is directed to grant to any applicant making a written request therefor a non-exclusive, non-assignable and unrestricted license, save for and at *a uniform reasonable royalty*, under any and all existing patents, to make or have made, use and sell vacuum-closing machinery for vacuum packing in glass containers and sealing the same with closures. * * *"

(Existing patents means all presently issued U. S. letters patent owned or controlled by defendant Owens or under which Owens has power to issue licenses, consisting of certain named patents.)

APPENDIX C

Supplemental Criticisms of the Handling of the Facts in the Government Brief

(1) The government has frequently followed the practice of citing and purporting to paraphrase a finding, while simply omitting whatever word or phrase there was in the finding favorable to du Pont.

Thus, the government, in its paraphrase (5-6) of the conclusory finding 95 omits sub-paragraph 10 (R. 305), evidently because that was confined to National Lead. Similarly, in dealing with the 1933 patent cross-licensing agreement between du Pont and National Lead (29-30), the government omits the Judge's finding that one purpose was

> "To settle the existing and potential patent disputes and to promote a more rapid development of the titanium business and a greater freedom of action for the parties under titanium pigment patents and developments" (R. 293).

Other illustrations are more hidden. Thus, the government says that "the defendants have imposed restrictions on resales" (5). This comes from the Judge's sub-paragraph 4 (R. 304), and just omits the phrase that "except to the extent found in Finding 93, the evidence does not establish as to DP that such restrictions were the result or effect of its agreement with NL or Tinc". Finding 93 in turn relates only to the du Pont-Tinc licensing agreements of 1940 and 1941, and therefore does not relate at all to the 1933 agreement or to any direct relationship between du Pont and National Lead.

(2) The government, although purporting to base its statements on the findings, has not hesitated to make other

statements of facts which were not found. The government sometimes makes statements of fact which were indeed found to the contrary.

An example of a fact found to the contrary is where the government says by innuendo that du Pont and National Lead had agreed to maintain Canadian prices (21). This precise contention was the subject of debate before the District Judge himself at the hearings on the findings; and he expressly refused so to find (*Cf.* FF 57, R. 269).

An example of a fact not found is where the government says that du Pont and Imperial Chemical Industries of England had an agreement to use a certain Canadian company as the proper vehicle for cooperation in Canada, and gives as a record reference R. 958 (20). As shown by Ex. R. 1508, titanium was in fact *excluded* from the du Pont-Imperial Chemicals agreement.

(3) The government has sometimes taken perfectly innocent practices and referred to them as if they were themselves badges of illegality.

An example is the statement (36) that National Lead and du Pont have cooperated to furnish to each other the raw material ilmenite and titanium pigment products, as if this were a restraint of trade. In the first place, the District Judge expressly found that there was no restraint of trade in ilmenite (FF 94, R. 303). In any event, here was a simple purchase and sale. Du Pont would not have improved competitive conditions in the industry by refusing to sell to National Lead what the latter needs to compete, or *vice-versa*.

(4) The government has prejudiced du Pont by citing findings against it which were expressly confined to National Lead.

An example occurs where the government is charging du Pont and National Lead with concertedly exercising the patent rights to dominate an industry and exclude competition (61). Three record references are given,—272, 291 and 303-6. 272 and 291 deal exclusively with National Lead and make no reference to du Pont. 303-6 is merely the ultimate Finding 95.

The free and easy way in which the facts are dealt with, when the government is in full spate of argument, is illustrated in this same sentence (61), where the government goes on to say that "the defendants" have granted licenses to American Zirconium and Virginia Chemical, when, of course, it was only du Pont that licensed Virginia Chemical.

What the government in its anxiety to attack du Pont has overlooked, is that we ourselves were not parties to, but rather intended victims of, the illegal combination. There was no difference between our position and that of any other potential American entrant into the industry (Zirconium, for example), except that we refused to accept the restrictive "principles" of the cartel and that Zirconium did accept them.

Another extraordinary example of the myopia which arose out of the government's jumping to the conclusion that du Pont was in the combination, is found in its sentence (30) that:

> "The agreement [of 1933 to which du Pont was a party] in substance coincided with the 'licensed field' of the 1920 agreement * * *."

Again, we welcome the government's point. We would urge the Court to read the definition of the "licensed field" in the 1933 agreement side by side with the definition of the 1920 cartel agreement. They appear respectively at

R. 74 and Ex. R. 2. We submit that their utter dissimilarity in draftsmanship proves either that the draftsman of the 1933 agreement never saw the 1920 agreement [which we believe to be the true fact, and which we are entitled to treat as the true fact in the absence of any evidence to the contrary by the government], or, alternatively, that the draftsman of the 1933 agreement expressly rejected the draftsmanship of the 1920 agreement. Certainly, if du Pont by the 1933 agreement were being drawn within the cartel and within the famous "principles" of the 1920 agreement, as the government would like to imply, it could not have played so fast and loose with the draftsmanship of the master document of the cartel.

REPLY BRIEF FOR NATIONAL LEAD COMPANY AND TITAN COMPANY, INC.

The Government's brief raises no question not disposed of in our main brief. It refers, however, to National's petition requesting the District Court to pass on the reasonableness of the royalty demanded by du Pont under paragraph 7 of the judgment (Gov. brief, pp. 55, 58, 71, 101, 105). In this reply we describe the petition and the reasons for submitting it in some detail. We deal also with the arguments against reciprocal licenses, in favor of unlimited disclosure of technology, and in favor of domestic divestiture. Material errors of fact are pointed out in the Appendix.

National's petition in the District Court for determination of the reasonableness of the royalty demanded by du Pont demonstrates the need for royalty-free licensing.

The petition referred to, filed and served October 9, 1946, shows the following:

Under paragraph 7 of the judgment (R. 313), National and du Pont were compelled to arrange for uniform, reasonable licensing of their patents as between themselves on or before July 11, 1946, or run the risk of suits for infringement. (Cancellation of the National-du Pont agreement did not take effect until nine months from the date of the decree, that is, July 11, 1946 [Par. 5, R. 310-12]; cancellation of this agreement was not stayed by the order of Mr. Justice Reed.)

Accordingly, National wrote du Pont on June 4, 1946 stating its licensing policy under paragraph 7 and offering du Pont a license in accordance with this policy. National offered licenses to any applicant having no patents demanded by National at either (*a*) a royalty of 1% of the value of the applicant's production under the patents or (*b*) a single royalty payment deemed by National and the applicant to approximate the total value to the applicant of National's patents; and in the case of any applicant having patents desired by National, no royalty in exchange for a license under the applicant's patents at no royalty.

(The royalty proposed in the case of applicants having no patents was thought to meet the requirement of a uniform, reasonable royalty. National submits, however, that royalty-free licensing is essential to create a condition honestly in harmony with the law [Main brief, pp. 58-63].)

On June 14, 1946 du Pont acknowledged National's letter, stating that National's licensing policy was not satisfactory to du Pont and suggesting that a value be placed on each patent under which either party desired a license and that du Pont was willing to undertake negotiations on that basis. On June 28, 1946 a second letter was received by National from du Pont stating that du Pont requested licenses under three patents owned by National, that du Pont would use one of these patents for a period of six months only, and that the other patents would relate to but a portion "of our present pigment production". On July 8, 1946 National wrote du Pont that "In our opinion it is impossible to evaluate each patent as suggested in your letter of June 14. In the case of du Pont and other manufacturers having patents desired by our company, we think the terms and purpose of the decree can be carried out only by a royalty-free exchange; in the case of manufacturers having no patents, licenses must be granted at a royalty which will clearly permit competition." National in this letter requested a license from du Pont under all of the du Pont patents dealt with in the decree.

On July 11, 1946 du Pont wrote National that "We must again state that we consider a royalty-free exchange wholly inconsistent with the decree of October 11, in as much as such exchange would result in continuation of the very agreement which the court has ordered cancelled. We are, however, prepared to license you under patents described in paragraph 4 of the decree—as to which your letter indicates you desire licenses—at a rate of two per cent of the value of your production based upon your published carload prices for all grades of pigments manufactured under any of these patents. We feel that this rate of royalty, which is consistent with our other existing licenses is

entirely reasonable and, to use your phrase, 'will clearly permit competition'." Du Pont then offered to pay whatever reasonable royalty National determined upon for a license under the three patents requested in its letter of June 28, and closed by saying—"In as much as we are entitled to a license under the patents in question pursuant to the terms of the decree, we propose to proceed on the assumption that we are licensed under the patents and, of course will make retroactive to today's date whatever royalty is finally determined upon."

Du Pont's final letter to National dated September 13, 1946, "confirming what was indicated generally" by counsel for du Pont "at their recent conferences" with counsel for National, restated its offer of licenses under any and all of its patents at a "non-cumulative" royalty of 2% of the value of National's production of pigments manufactured under the licensed patents, such value to be based on National's published carload prices for the particular grades of pigments involved, and requested a license from National under the three patents listed in its letter of June 28, 1946, offering to pay therefor a royalty of 1% to be determined as above. Receipt of this letter was acknowledged by National September 18, 1946.

Whereupon, on October 9, 1946, National filed its petition for a determination of the reasonableness of the royalty demanded by du Pont, together with notice of motion for an order pursuant to the petition returnable October 15, 1946.

In its petition National alleged, and was prepared to prove, that if the du Pont policy should prevail National would be required to pay du Pont at least $1,500,000 net

royalty up to January 1, 1950; that this payment might be increased to over $11,000,000 by January 1, 1961 if National should be unable to avoid certain du Pont patents which National now uses as an integral part of its manufacturing process, and if, after prolonged and costly litigation, it should be determined that such patents are valid; that competition would not be promoted by the payment of millions of dollars by National to du Pont, in that du Pont would be placed in a dominant position in the industry, with all others, new and old alike, paying tribute, and that all other manufacturers would thus be placed at a competitive disadvantage.

National also alleged, and was prepared to prove, that during the period of the National-du Pont agreement (the cancellation of which is not now contested by National) National and du Pont adhered to the policy of privately determining which company had priority in respect of patent claims which were the subject of interference proceedings between them; that National was content to settle interference questions in this way because, even if du Pont received the patent, National received a royalty-free license under the agreement.

The motion came on for hearing before District Judge Simon H. Rifkind, who had presided at the trial, October 24, 1946. Judge Rifkind, after indicating that the court had jurisdiction, stayed the motion, "retaining it upon the calendar of this Court, until such time as the Supreme Court has decided the principal appeal", stating his reasons as follows:

> ". . . I fear that such an inquiry would occupy a very considerable amount of time and would be neces-

sarily premised upon the validity in all respects of the decree now challenged in the Supreme Court. Whether that decree is too broad, as the defendants allege, or too narrow, as the government alleges, is something that I certainly have no opinion on and one which can only be disposed of by the Supreme Court.

"It may well therefore be that the work of this Court in conducting such an investigation at this time would turn out to be academic and moot and fruitless. I think consideration for the Courts' calendars and for the disposition of other business pending in this court warrants staying this matter until we know whether the decree under which this application is made is a final and valid decree."

Following a statement by counsel for National that the court had found that National and du Pont dominated and controlled the business of titanium manufacture in the United States and that they had achieved a monopoly of technical information by virtue, among other things, of a proliferation of patents, the following colloquy took place:

"The Court: No doubt about that. I will believe that forever.

"Mr. Webster: Well, your Honor has certainly found that in terms which are unmistakable.

The Court: I will go further than that. I would have liked to go along on the question of royalty-free patents but I felt that I hadn't been given the green light on that."

Judge Rifkind was acutely aware of the difficulty of determining a reasonable royalty; he indicated that it would be necessary to appoint a master to take testimony and said that he feared "such an inquiry would occupy a very considerable amount of time". (Cf. Gov. brief, pp. 63-78)

The petition is significant as indicating the use to which du Pont proposes to put its patents as a consequence of the judgment and the difficulties which will be encountered in determining and administering uniform, reasonable royalties. Cf. *United States* v. *Hartford-Empire Co. et al.*, 65 F. Supp. 271 (N. D. Ohio 1946).

Du Pont's attitude is expressed in its brief, pages 113-19. While the argument is there made in connection with technical information, it applies with equal force to royalty-free licensing. It is du Pont's position that because American Zirconium and Virginia Chemical (both subsidiaries of very large companies, *infra*, p. 17) were each able to achieve something less than 5% of the aggregate domestic production of TiO_2 over a period of approximately 10 years (Findings 31, 32, R. 244, 245),—National and du Pont having 46.4% and 45.1% respectively of the pure TiO_2 production in the United States in 1943 (Findings 3, 9, R. 236, 237),—neither of these companies has been hampered and, therefore, that anyone else could do as well without the defendants' technology, and without royalty-free licenses.

We submit that this argument is clearly and palpably fallacious (see our main brief, pp. 60-2). Royalty-free licensing (together with the cancellation of the agreements found to be illegal) is essential to "restore titanium to the system of free competition" (63 F. Supp. at 532, R. 222).

II

The reciprocal licensing provision should be retained.

(Answering Plaintiff's Point II, pp. 124-7)

The Government's argument against the provision in paragraph 7 of the judgment (R. 313) requiring an applicant for a license under the defendants' patents, whether royalty-free or at a reasonable royalty, to license the defendants under the applicant's patents is founded on three propositions: (*a*) reciprocal licensing was not required in the *Hartford-Empire* case, 323 U. S. 386; (*b*) because the defendants are guilty they should be penalized; and (*c*) the court has no power to compel non-defendants to license their patents (Gov. brief, pp. 124-7).

We shall discuss each of these contentions.

(a)

Reciprocal licensing was not required in the *Hartford-Empire* case for the reason stated by Judge Rifkind during the argument on the decree in this case, as follows:

> ". . . At this moment I am unable to contrive an argument which has plausibility as to why it [reciprocal licensing] should not be done, and that is why I asked about the Hartford-Empire case, and the answer, of course, was effectively given that in that case you were dealing with a purely licensor organization which had no use for patents except for the control of licensing, and consequently there would be no benefit to it in receiving such cross-license." (R. 1274-5)

(b)

The argument that the defendants are in a better position than non-defendants because of the illegal actions of

the defendants and therefore should be compelled to give up what they have to "restore titanium to the system of free competition (R. 222)" (Gov. brief, p. 124) was considered and rejected by the court below, as follows (R. 1272-4):

> "The Court. What argument is there to be made in opposition to the proposition that if compulsory or free licensing is to be granted, that a reciprocal obligation from the beneficiary of that privilege should not be exempt [sic]?
>
> "Mr. Dixon. Well, I can very well visualize vehement opposition to such a proposal by even the present companies in the industry [subsidiaries of Glidden and Cyanamid] who would regard it as bringing about a difficulty with which they would be faced, or a condition imposed by the Court as a requisite to their receiving the license.
>
> • • • • •
>
> "The Court. I want to know why shouldn't they be exempt.
>
> • • • • •
>
> "The Court. . . . but assuming that the prospective beneficiaries of a free grant do not like it, is there anything by which they could justify their disaffection?
>
> "Mr. Dixon. As to that I am in no position to state, your Honor, I don't know.
>
> "The Court. Well, is it a fair thing to do, or would it defeat the purposes of the statute to exact such a condition from them?
>
> "Mr. Dixon. I can see where that may be argued, and that was the argument made by the defendants

during the course of this trial, that the whole combination or purpose was to permit the industry—

"The Court. After all, there is nothing to prevent Webster from making a private agreement for an exchange. I mean it [reciprocal licensing] is the lesser of the greater evil.

• • • • •

"The Court. That is, an exchange which has a very limited relationship in comparison to making a universal exchange.

"Mr. Dixon. May I ask this question? I do not understand whether your Honor was thinking along the line of having this on a royalty-free basis.

"The Court. Assuming royalty-free, why shouldn't it be perfectly proper, assuming royalty-free, that if Virginia Chemical wanted all the National Lead patents free, that Virginia Chemical should offer National Lead an equally free license on all of its titanium patents?

"Mr. Dixon. I can see where that might have considerable merit, your Honor.

"The Court. And if it is on a stipulated control, modest royalty but compulsory, and if Virginia Chemical wants access to the du Pont patents, why shouldn't du Pont have the advantage of all the Virginia Chemical patents? Otherwise you will arrive at a situation conceivably where Virginia Chemical would simply change places with du Pont in becoming the dominating factor in the industry under this extraordinary advantage of being able to take everything for itself and keeping everything that it has.

"Mr. Dixon. Well, if I understand your Honor's question, it is directed to the granting of royalty-free licenses by the defendants?

"The Court. No. I am suggesting it on both premises.

"Mr. Dixon. I understand, or, in other words, to anyone who wants the use of these patents on a reciprocal basis." (R. 1272-4)

The reciprocal provisions of paragraph 7 should be retained whether this Court compels royalty-free licensing or affirms compulsory licensing at a uniform, reasonable royalty.

(c)

We concede that the court has no power to compel non-defendants to license their titanium patents to any applicant. The judgment requires a non-defendant applicant to license a defendant under its titanium patents only if the non-defendant desires a license under the defendant's patents. No one is compelled to request a license (R. 313).

III

Disclosure of technical information should be limited as provided by the judgment.

(Answering Plaintiff's Point III, pp. 127-31)

The Government takes the position that the defendants should be compelled to furnish all technical information "accumulated" by them to any applicant therefor. The defendants, presumably, would be permitted to make a reasonable charge for this information (Gov. brief, p. 131).

The judgment, says the Government (brief, pp. 127-31), does not give an applicant access to the fund of technology accumulated by the defendants, in that (*a*) it fails to compel disclosure of information on the solution of general problems of the industry; (*b*) it fails to compel disclosure of information "relating to the production of products within the ambit of the restraints of the industry, as defined by the definition of 'licensed field' in the various agreements, which are neither patented nor produced by a patented process or apparatus"; (*c*) it fails to compel disclosure of information relating to "expired patents including the basic patents upon which the industry is based"; and (*d*) it fails to compel disclosure of information "relating to the practice of any patented invention which the defendants have not put into commercial use."

Paragraph 7 of the judgment provides (R. 314) that

> "During a period of three years from the date of this decree such license or reciprocal license may at the option of either party contain a provision for the imparting in writing, at a reasonable charge, by the licensor to the licensee, of the methods and processes used by the former at the date of the license in its com-

mercial practice under the licensed patents in connection with the production of titanium pigments".

The District Court found (Finding 37, R. 249) that

". . . . The patents relating to titanium pigments and compounds comprise considerably more process claims than product claims. The process claims, with the exception of those of the so-called Rutiox patents which relate to the production of rutile-type titanium pigments, cover for the most part improvements in manufacturing processes originally disclosed in the Barton-Rossi, Jebsen, and Blumenfeld patents, which improvements have led to the improved present-day commercial titanium pigments. The product claims cover practically all such improved titanium pigments; thus, of 23 different grades of titanium pigments (i. e. different products) sold by NL, 21 are covered by unexpired patents. . . . .

Surely, the compulsory disclosure of "methods and processes used by . . . [the defendants in their] commercial practice under the licensed patents in connection with the production of titanium pigments" would enable any applicant to enter this industry. This is particularly true in view of the finding that substantially all present commercial products are covered by either process or product patents.

We are unable to visualize the condition which would exist under the Government's proposals. If the defendants were required to disclose information relating to the practice of patented inventions which are not used in their commercial processes, it would mean that they would be required to explain every laboratory experiment upon which a patent had been secured. It would require National to devote its technical organization to the demands of any

applicant. Any such provision would be confiscatory and go far beyond any requirement necessary to create a condition in harmony with the law.

As the Government recognizes (brief, p. 130), this Court deleted a paragraph of similar character in the *Hartford-Empire* judgment (323 U. S. at 418).

The proposal was fully discussed and considered and was disposed of at the hearings on the decree, as follows (R. 1228-9):

> "Mr. Webster. . . . Now again to discuss for a moment those provisions which are intended to create a condition in harmony with the law and to shear us of the right to prevent a development of a plan, development of a condition, consistent with the law, we think the know-how provision is appropriate and we would expect to have a decree in which we would be required to give know-how necessary to put to use patents that are licensed by our company. We think the Government's suggested provision goes far beyond that; that it would require us to become a sort of nursemaid, teaching the manufacturing skills, technological skills that are not related to the use of patents that would put us into the manufacturing business and that would lead to all kinds of controversy and disorder.
>
> "The Court. Isn't your suggestion, theoretically at least, equal to zero, because I was under the impression that a patent to be good, meaning valid, must sufficiently disclose the art so one skilled in the art could practice it without further instruction?
>
> "Mr. Webster. Your Honor, that is a very interesting observation because we have just been discussing that very point together during the noon hour and Mr. Williamson made, at one point, substantially the same observation that your Honor has now made. We think

that theoretically a chemist as skilled as the chemist who made the invention and applied for the patent, or one perhaps who was capable of becoming as skilled as that, would be able to take a series of patents and put them into use. On the other hand, as a practical matter, the know-how that we are talking about is the know-how that would enable a concern or a group of chemists not familiar with the manufacture under patents of titanium pigments, to put the patents into operation as a group to get started in the manufacturing business under the patents, and we think that is as far as it ought to go. We think it is difficult to define exactly what that is, but we are willing to take any amount of trouble to try to do that. We think that the line between that, and as I say serving as a kind of wet nurse to the X Company's chemist or the Cyanamid Company or the Sherwin-Williams Company or the Pittsburgh Plate Glass Company or the Zinc Company for a period in perpetuity or during the life of the patents, is very impractical and very unwise and an unnecessary provision. Indeed, we think it is confiscatory so far as it requires us to devote our technical organization to the solution of the technological problems of those companies."

The District Court and counsel did take "any amount of trouble" in drafting paragraph 7 of the judgment. The defendants are compelled to disclose to any applicant the technology used by them in their commercial manufacture of titanium pigments. We are unable to see why this requirement, coupled with royalty-free licensing, will not enable any company having the other necessary facilities to enter and engage in the business.

IV

No domestic divestiture should be granted.

(Answering Plaintiff's Point IV, pp. 131-43)

We have answered the argument of the Government for domestic divestiture in our main brief, pages 86 to 98. The subject of prolonged discussion below, the argument made here was rejected.

It is interesting to note that counsel for the Government below stressed the alternative nature of the relief sought. Thus at R. 1221:

> "Mr. Dixon. . . . I mean I do not want the Court to understand that should it feel that it would be willing to grant some form of royalty-free licensing, that it would necessarily be the position of the Government that we would also require, in addition thereto, or ask the Court for, complete divestiture under paragraph 9 of the decree. . . . So as I indicated, we are making these requests in the alternative and feel that some form of royalty-free licensing, as laid down in the Vehicular Conveyance [sic] case, may well be granted by the court, and, in the alternative, some form of divestiture, either complete or partial, and if a preference were to be requested by the court it would be the request of the Government that some form of divestiture be granted for the reasons urged in the argument this morning. . . ."

The Government has switched its preference. That this is so is indicated by the fact that in its brief 70 pages are devoted to royalty-free licensing and only 13 pages to domestic divestiture. The switch was compelled by the questions and discussion of the trial judge and by his decision (*e. g.*, R. 1198-1214, 1249, 1252-69). After prolonged argument, the court refused complete or partial divestiture, not for want of power to grant it, but as an act of discretion (R. 1286).

Like the Government in the court below, we submit that it is unnecessary to grant both royalty-free licensing and complete or partial divestiture to "restore titanium to the system of free competition" (R. 222). Royalty-free licensing is essential. We are opposed to any form of divestiture on the ground that there is no factual or legal basis even to consider it in this case.

The Government contends (brief, p. 136):

> ". . . That the courts have . . . recognized that adequate competition cannot be secured in a duopoly situation, much less with a duopoly characterized by an entire history of complete absence of competition, is evidenced from the fact that in every divestiture or dissolution suit in the past, the creation of more than two competing units was required."

This statement (if it means what it seems to be intended to mean) falls apart on analysis. The fact asserted—that the domestic industry is "characterized by an entire history of complete absence of competition"—is in conflict with the facts and the findings; and the statement—"that in every divestiture or dissolution suit in the past, the creation of more than two competing units was required"—misconceives or ignores the effect of the cases referred to.

The trial court found (R. 290-1):

> "78. From 1933 [the date of the National-du Pont agreement] on there was active competition between NL and DP for customers. There has been a vast increase in sales; and repeated reductions in the price of titanium pigments have taken place and a very few increases. DP entered the titanium pigment business in 1931 and since that date it has made frequent plant expansions for the manufacture of pure and composite TiO_2 and its production increased from 20,027 tons in 1935 to 50,674 tons in 1941 and then decreased to 42,843 tons in 1948.

"NL and DP have endeavored to match each other's titanium products; but each also manufactures certain titanium pigments having special applications not manufactured by the other.

"There is no allocation of territory or customers between NL and DP; and each maintains a large, highly trained technical sales force engaged in endeavoring to sell titanium pigments. To a very large extent the salesmen of the two companies are chemists whose contact with consumers (that is, manufacturers of paint, rubber, glass, etc.) consists in endeavoring to demonstrate that their products merit acceptance on the basis of technical superiority. The buyers of titanium pigments are mainly well-informed, experienced purchasing agents. NL and DP sell for identical prices; there is no evidence that such price identity is the product of agreement or collusion."

The statement "that in every divestiture or dissolution suit in the past, the creation of more than two competing units was required" is documented in our main brief at pages 90 to 94. In the cases cited (Gov. brief, p. 136, footnote 46) (*Standard Oil, American Tobacco, du Pont,* and *Corn Products*) the combinations—the fusions resulting from illegal acquisitions—were illegal; the *status quo ante* (or a reasonable approximation of it) could be and was effected by dissolution (divestiture). Here there were no illegal acquisitions. As Judge RIFKIND pointed out (R. 1265-9), it would be impossible to restore the *status quo ante* because there is "no point of reference." The Government, according to Judge RIFKIND, "would create a condition which man has not yet seen, namely, the existence of four enterprises which have had no prior existence either in fact or in human contemplation" (R. 1266). For this the Government's citations are inapposite.

The Government states (brief, p. 53) that National and du Pont are giants to be destroyed in order that small companies may enter the titanium business,—at the same time stating that huge capital is necessary to enter it (*id.* at 132).

It is true that du Pont's assets are in excess of $1,000,000,000 (Finding 9, R. 237), National's in excess of $100,000,000 (Finding 3, R. 235). But the companies most likely to take advantage of the judgment are comparable in size and resources. Thus Glidden (owner of American Zirconium) has assets in excess of $55,000,000; American Cyanamid (owner of Virginia Chemical) has assets in excess of $140,000,000; Pittsburgh Plate Glass has assets in excess of $150,000,000; and Sherwin-Williams has assets in excess of $75,000,000. (Moody's Manual of Investments, 1946, pp. 2469, 2640, 1509, 979.) In 1945 New Jersey Zinc had an operating income (less costs, taxes, depreciation, depletion, and operating expenses) of $6,603,571.80. (Statement to stockholders for year ending December 31, 1945; no statement of assets is available.) These companies are mentioned because their interest in this industry has been established by the record (Finding 33, R. 246; R. 1171-2).

As pointed out by the court below, it would not promote competition to transfer the titanium business of National to Pittsburgh Plate Glass or American Cyanamid (R. 1217-18).

V

Conclusion

We submit, in conclusion—

1. That paragraphs 5 and 6 of the judgment should be modified as suggested on pages 52 and 53 of our main brief to permit normal and proper business arrangements.

2. That paragraph 7 should be amended to require royalty-free licensing and in other respects affirmed.

3. That paragraph 8 should be deleted so as to permit National to retain its stock interest in the British company.

4. That the trial court's refusal, as an act of discretion, of domestic divestiture should be affirmed.

Respectfully submitted,

Bethuel M. Webster,
Counsel for National Lead Company
and Titan Company, Inc.

Clifton P. Williamson,
Edward L. Rea,
Carolinda Waters,
Of Counsel

Appendix

The Government is in error in stating (a) that National and du Pont acted jointly respecting American Zirconium and Virginia Chemical, and (b) that the Barton-Rossi, Jebsen, and Blumenfeld patents represented "independent and competing lines of development".

(a)

National and du Pont acted independently respecting Zirconium and Virginia Chemical.

In spite of Findings 84 and 85 (R. 295-8) that "The evidence does not warrant the inference that the licenses granted by DP to Zirconium and the cross licensing between NL and Zirconium were made pursuant to a common plan of NL and DP or as a result of concerted action by them",—and that "There is no evidence that the action of NL and DP with respect to VC was the result of agreement between NL and DP",—the Government repeatedly refers to National and du Pont as if they were (and thus implies that they were) engaged in joint action respecting Zirconium and VC. Thus at pages 5 and 6 of its brief the Government says—

> "The findings of fact (R. 234-306) state . . . that *defendants* have restricted the production of their two domestic licensees to limit their competition; . . . "

And at pages 7 and 8—

> ". . . The judgmen' also provided that the two present licensees of *NL and* DP might within six months apply for licenses from *NL and* DP on the described basis (R. 314-315)."

Findings 84 and 85 show that VC was never a licensee of NL and that the NL-Zirconium agreement, unlike the DP

license to Zirconium, contained no production limitation. The judgment (Par. 9, R. 314-15) provides that "Either American Zirconium Corporation or Virginia Chemical Corporation, their successors or assigns, may at their option, if exercised within six months from the date of this decree, apply for licenses *from DP* under provisions of paragraph 7."

Similar distortions of the facts and findings appear in the Government's brief at pages 36 to 40, 50, 61, 70, 100, and 138.

(b)

The Barton-Rossi, Jebsen, and Blumenfeld patents were complementary; they were not "independent and competing lines of development".

The record is clear and conclusive. The findings are explicit. Barton-Rossi (the Americans) contributed composite pigments. Jebsen (the Norwegian) contributed the cheap sulphuric acid attack. Blumenfeld (the Frenchman) contributed an improved method (seeding hydrolisis) for manufacturing pure TiO_2. (See, *e. g.*, Barton, R. 869-73; Kaegebehn, R. 910-11; Jebsen, R. 919, 929. Cf. Findings 33, 34, 37, and 70, R. 245, 247-8, 278.)

Despite the testimony, which stands unchallenged, the Government repeatedly (brief, pp. 43-50) asserts that there were three "competing lines of development" and thus implies that technical competition was stifled at the expense of the public. Nothing could be further from the truth. The relatively pure TiO_2 pigments were a laboratory product—rare and expensive. Without Jebsen's sulphuric acid attack the cost of composite pigments was prohibitive. Du Pont was unable to engage in the business without the

Blumenfeld, Barton-Rossi, and Jebsen patents. The Blumenfeld patents were useful to National. The use of these complementary (not "independent and competing" patents) by National and du Pont has promoted domestic commercial competition, has resulted in a vast increase of sales and repeated reductions of price, until today titanium pigments have largely replaced the more expensive, less satisfactory white lead, lithpone, and zinc oxide pigments. (See our main brief, pp. 11-15, 40-2; Opinion, R. 187-8, 206-7.)

DISTRICT COURT OF THE UNITED STATE,
FOR THE SOUHTERN DISTRICT OF NEW YORK

Civil No. 26-258

UNITED STATES OF AMERICA,

Plaintiff,

against

NATIONAL LEAD COMPANY, TITAN COMPANY, INC., E. I. DU PONT DE NEMOURS AND COMPANY, INC.,

Defendants

STATEMENT AS TO JURISDICTION

In compliance with Rule 12 of the Rules of the Supreme Court of the United States, defendant E. I. du Pont de Nemours and Company (hereinafter referred to as du Pont) submits this statement showing the basis upon which it is contended that the Supreme Court of the United States has jurisdiction upon appeal to review the Final Decree in the above entitled cause.

Statutory Provisions Sustaining the Jurisdiction

This is an appeal from a decree of the District Court of the United States for the Southern District of New York in a suit in which the United States, as plaintiff pursuant to Section 4 of the Sherman Act, sought and obtained an injunction against du Pont and others in respect of acts found to constitute a violation of Section 1 of said Act

(Act of July 2, 1890, c. 647, Secs. 1 and 4, 26 Stat. 209; 15 U. S. C. Secs. 1 and 4).

The appeal lies directly to the Supreme Court of the United States under Section 238 (1) of the Judicial Code, as amended by the Act of February 13, 1925 (43 Stat. 936, 938; 28 U. S. C. Sec. 345), and under Section 2 of the Expediting Act of February 11, 1903 (c. 544, Sec. 2, 32 Stat. 823, 36 Stat. 1163, 58 Stat. 272; 15 U. S. C. Sec. 29).

Date of Decree and Application for Appeal

The decree sought to be reviewed was entered October 11, 1945.

The petition for appeal is being presented on December 10, 1945.

Nature of the Case and Rulings Below

On June 24, 1944, the United States filed a complaint against du Pont, the National Lead Company and Titan Company, Inc. alleging that each of such defendants had violated Sections 1 and 2 of the Sherman Act by agreeing, combining and conspiring to restrain and to monopolize the foreign and domestic trade and commerce in titanium pigments. The complaint prayed, among other things, (a) that the defendants' alleged practices be held in violation of Sections 1 and 2 of the Sherman Act, (b) that the defendants be enjoined from continuing such practices, (c) that the defendants be enjoined from threatening or bringing any infringement suits upon any of their United States patents relating to titanium pigments, (d) that the defendants be compelled to grant upon the request of any third person royalty-free licenses under such patents, and (e) that the defendants be compelled to furnish such third person all technical information appropriate to the practice of such patents.

The case came to trial on December 4, 1944, and the trial ended on March 14, 1945. On July 5, 1945, the District Court filed an opinion and on October 2, 1945, the District Court entered its Findings of Fact and Conclusions of Law. Copies of said opinion (which has not yet been reported) and of said Findings of Fact and Conclusions of Law are appended hereto.*

The District Court found that titanium is an abundant element, that titanium compounds are suitable for the manufacture of titanium pigments and that such pigments are desirable in connection with the manufacture of paints, rubber, glass, paper, vitreous enamel and other products. The District Court also found that there was no titanium industry prior to 1920 and that such industry was created by an agreement in 1920 between defendant National Lead, which at that time held fundamental patents covering the manufacture of titanium pigments, and a Norwegian company which held patents of a like character. Under the 1920 agreement the parties cross-licensed their patents, present and future, agreed never to question the validity of the patents of the other, and agreed to exchange technical information respecting such patents. In addition, however, the District Court found that the parties to the 1920 agreement divided the world into trade territories, agreed not to trespass into the territory allotted to the other and to compel sublicensees to abide by like restrictions. According to the District Court, the objects of the parties to such agreement were the elimination of competition and the advancement of the art through the exchange of technology. The District Court further found that the 1920 agreement succeeded in carrying out the intentions of the parties and was the basic agreement pursuant to which defendant Na-

* (Clerk's Note—The Opinion, Findings of Fact, Conclusions of Law and final decree are printed as Appendices to the Jurisdictional Statement in No. 1130 and are not reprinted here.)

tional Lead, through defendant Titan Company, Inc. (described by the District Court as National Lead's "corporate pocket for the deposit of its holdings in foreign titanium enterprises") developed the titanium industry in France, Germany, England, Japan and Canada on a co-partnership basis with local chemical concerns in those countries.

Turning to defendant du Pont, the District Court found that it entered into the titanium industry in 1931 at which time it acquired some titanium patents. It also found that du Pont and National Lead at all times thereafter were in active competition for customers, that they have likewise at all times endeavored to match each other's products and that while they have sold at identical prices, such price identity was not the product of agreement or collusion. It was likewise recognized by the District Court that upon du Pont's entry into the titanium industry patent controversies arose between National Lead and du Pont and that during such controversies National Lead endeavored to have du Pont subscribe to the principles of the 1920 agreement. The District Court further found that du Pont refused, unlike the numerous other companies having contractual relations with National Lead, to do so. Instead, du Pont and National Lead entered into a patent cross-licensing agreement in 1933 which the District Court found to have been prepared in the light of the then recent decision of the Supreme Court of the United States in *Standard Oil Company (Indiana), et al.* v. *United States*, 283 U. S. 163. But while the District Court found that du Pont did not agree with National Lead to refrain from exporting titanium pigments it also found that du Pont did, through the official in charge of its titanium enterprise, Mr. Rupprecht, assure National Lead that, as a practical matter, such exports would not take place. For this reason the District Court concluded that du Pont became a mem-

ber of the illegal combination—in the Court's words, "true, a special member, with a status, rights and obligations, different from that of the other members, but a member nonetheless."

On October 11, 1945, a Final Decree was entered which, among other things, with reference to du Pont (a) cancels its agreements with defendants National Lead Company and Titan Company, Inc., (b) enjoins it from entering into or adhering to any agreement relating to titanium pigments which has as its purpose or effect to divide sales or manufacturing territories, to allocate territories, to limit or prevent United States imports or exports, to grant to any third party any market as its exclusive territory or to keep any third party out of any market, (c) enjoins it from restricting any purchaser of titanium pigments in the use of such pigments, (d) compels it to grant to any applicant a non-exclusive license under any of its patents or patent applications (and under all those which it acquires during the five years following the date of the decree) relating to titanium pigments at a uniform, reasonable royalty, (e) compels it during three years from the date of the decree to impart, in writing, at a reasonable charge, to any such applicant, at the latter's option, a manual of the methods and processes which du Pont uses at the date of the license in its commercial practice under the licensed patents in connection with the production of titanium pigments, (f) enjoins it from bringing or threatening any action against any persons for the alleged infringement prior to the date of the decree of its titanium patents, and (g) compels it to permit the Attorney General of the United States or his proper representative to interview its employees and to have access to its books and records relating to any matters contained in the decree. A copy of said Final Decree is appended hereto.

Cases Sustaining the Jurisdiction of the Supreme Court of the United States

Among the decisions sustaining the jurisdiction of the Supreme Court are the following:

Standard Oil Company (Indiana) v. *United States*, 283 U. S. 163, 170-171;
Interstate Circuit, Inc. v. *United States*, 306 U. S. 208, 226, 227;
United States v. *Masonite Corporation*, 316 U. S. 265, 274-275;
Direct Sales Co. v. *United States*, 319 U. S. 703, 713;
Braverman v. *United States*, 317 U. S. 49, 53;
United States v. *Falcone*, 311 U. S. 205, 210;
Gebardi v. *United States*, 287 U. S. 112, 121;
Wong Tai v. *United States*, 273 U. S. 77, 81;
Frohwerk v. *United States*, 249 U. S. 204, 209;
Williamson v. *United States*, 207 U. S. 425, 447;
Bannon and Mulkey v. *United States*, 156 U. S. 464, 468;
Dealy v. *United States*, 152 U. S. 539, 547;
Pettibone v. *United States*, 148 U. S. 197, 202;
United States v. *Britton*, 108 U. S. 199, 204;
United States v. *Hirsch*, 100 U. S. 33, 34;
Hartford-Empire Co. v. *United States*, 323 U. S. 386, 406-410, 413, 414-415, 417, 418;
Associated Press v. *United States*,* 89 L. Ed. 1512, 1524;
The Standard Oil Co. v. *United States*, 221 U. S. 1, 77, 78;
United States v. *American Tobacco Co.*, 221 U. S. 106, 185, 187, 188;

* Not yet officially reported.

De Beers Consolidated Mines, Ltd. v. *United States*, 325 U. S. 212, 218-220;
Appalachian Coals v. *United States*, 288 U. S. 344, 377;
Swift & Co. v. *United States*, 196 U. S. 375, 396;
New Haven R. Co. v. *Interstate Commerce Commission*, 200 U. S. 361, 404;
E. W. Bliss Co. v. *United States*, 248 U. S. 37, 48;
National Labor Relations Board v. *Express Publishing Co.*, 312 U. S. 426, 436-437;
Warner & Co. v. *Lilly & Co.*, 265 U. S. 526, 532;
Federal Trade Commission v. *Beechnut Packing Co.*, 257 U. S. 441, 455;
United States v. *Bausch & Lomb Co.*, 321 U. S. 707, 724, 726;
Ethyl Gasoline Corp. v. *United States*, 309 U. S. 436, 461;
United States v. *Crescent Amusement Co.*, 323 U. S. 173, 185, 186, 189;
United States v. *Aluminum Co. of America*, 148 F. (2d) 416, 446.

The Questions Involved Are Substantial

Defendant du Pont contends that its appeal to the Supreme Court of the United States would involve questions of extraordinary substance. One of them concerns the law of conspiracy and the validity of the District Court's holding that du Pont became a member of the combination by directing National Lead's attention to the fact that it was not, as a practical matter, interested in exporting titanium pigments to Europe even though it simultaneously refused to agree to refrain from such exports.

Another involves the validity of that portion of the Final Decree which compels du Pont to impart technical information concerning its patents. So far as we know, no relief

of this character has ever been granted heretofore. An analogous provision was stricken by the Supreme Court of the United States on its review of the decree in *Hartford-Empire Co.* v. *United States*, 323 U. S. 386 at 413 and 418.

December 10, 1945.

The Case Affecting National Lead and Titan, Inc.	5
The Case Affecting du Pont	7
STATEMENT OF THE FACTS	9
A. COMPETITIVE CONDITIONS HAVE PREVAILED IN THE UNITED STATES SINCE 1933	9
1. Du Pont's Entry Into the Industry and Patent Conflict with National Lead	9
2. Commercial Competition	12
A. Increasing United States Production	12
B. No Price Agreements	13
C. No Division of Territory	13
D. No Allocation of Customers	13
E. Competition in Quality of Products	14
F. Development of New Products	17
3. History of Exchange of Technical Information between National Lead and du Pont, and of its Abandonment in 1940	17
4. Du Pont's Licensing Policy and Practice	19
A. No Refusal to License Under its Patents	19
B. Licenses to Virginia Chemical	20
C. Licenses to American Zirconium	21

PAGE

B. Creation and Operation of the Cartel—du Pont not Concerned in This 23
1. Introductory 23
2. The Conspiracy 24
C. Unsuccessful Efforts to Bring du Pont Into the Cartel 27
1. Consent of National Lead's Foreign Associates to the 1933 Patent Licensing Agreement 27
A. Requirement of Obtaining Such Consent. 27
B. Du Pont's Refusal to Make Illegal Commitment During Negotiations Culminating in the 1933 Patent Licensing Agreement 29
2. Du Pont Remained Independent During the Period Subsequent to 1933 39
3. Du Pont's Export Policy Maintained for Valid Business Reasons 43
4. The 1941 Amendment to the 1933 Patent Licensing Agreement Retained du Pont's Independence 46

SPECIFICATION OF ASSIGNED ERRORS TO BE URGED 48

SUMMARY OF ARGUMENT 48

ARGUMENT 51

Part One—The Decision Below Should Be Reversed as to du Pont 51

Point I. Du Pont Did Not Become a Member of the International Cartel 51

(A) The District Judge Found that du Pont Did Not Agree to Become a Member of the Cartel. The Absence of Agreement is Fatal at Law 51

PAGE

(B) Assuming *Arguendo* that Agreement Is Not Necessary to Violation of the Sherman Act, Then What du Pont Said or Did Must Be Measured by the Test of Reasonableness. Confronted with the Necessity of Obtaining a License Under the Cartel Patents, It was Certainly Reasonable for du Pont Merely to State That It Was Not Its Then Business Policy to Seek Export Trade, Accompanied by a Refusal to Bind Itself for the Future. This Is All that the Judge Found that du Pont Did 65

POINT II. THE 1933 PATENT LICENSING AGREEMENT WAS DESIGNED TO AND DID PROMOTE RATHER THAN RESTRAIN COMPETITION AND TRADE 84

(1) All of the Features Complained of in the 1933 Agreement Were Present in the Agreements in the Oil Cracking Field and Approved by This Court..... 95

(a) The Exchange of Rights Under Future Patents 95

(b) The Exchange of Technical Information 99

(c) The Tonnage Limitations on du Pont's Licensees 101

(i) American Zirconium 102

(ii) Virginia Chemical 105

(2) The Decision of This Court in the *Cracking* Case is Controlling..... 106

PAGE

PART TWO—THE PROVISION IN THE DECREE COMPELLING DISCLOSURE OF EXISTING AND FUTURE TECHNICAL INFORMATION SHOULD IN ANY EVENT BE ELIMINATED 109

(1) The District Court Exceeded Its Legal Authority 110

(2) The District Court Abused Its Discretion.. 113

APPENDIX A

Letter, June 28, 1933, Rupprecht to Beschorman. 121

Letter, July 12, 1933, Beschorman to I. G. Farbenindustrie 122

APPENDIX B—ANALYSIS OF THE DISTRICT JUDGE'S OPINION ON THE ISSUES INVOLVING DU PONT SHOWS CLEARLY HIS ERRORS OF FACT AND LAW.. 125

1. The District Judge's Heading II..... 125

(a) The District Judge found a sharp deviation and contrast between the conduct of du Pont and that of the other defendants, with which du Pont competed 125

First paragraph of Opinion, R. 213..... 125

(b) The District Judge recognized that if du Pont was a member of the combination at all, it was not a regular member..... 126

(c) The District Judge also recognized that du Pont had an alert consciousness of the anti-trust laws, violation of which it was at least seeking to avoid 127

Second paragraph, R. 213 127

(d) The District Judge also recognized that du Pont's purpose and intent was to obtain access to patents and technical information. This was obviously lawful..... 129

Third paragraph, bottom R. 213..... 129

PAGE

(e) The District Judge further recognized that the 1933 agreement was drawn under the principles established by this Court in the *Cracking* case, 283 U. S. 163. 130

Paragraph at middle R. 214..... 130

Paragraph commencing bottom R. 214... 131

First paragraph, R. 215..... 131

(f) The District Judge, however, concentrated attention on two documents—two letters written at the time to prevent the Germans from vetoing the license agreement of 1933. 132

(g) But the District Judge recognized that the first document—a letter from du Pont—did not violate the law..... 133

(h) The District Judge then pinned his decision adverse to du Pont on a single document, one written by National Lead, not by du Pont... 134

Second paragraph, R. 215..... 134

(i) That National Lead letter, addressed to the Germans, itself enclosed the innocent du Pont letter which stated du Pont's position. The National Lead letter ought not, therefore, to have been construed apart from the enclosed du Pont letter, or in disregard of du Pont's conduct 134

Third paragraph, bottom R. 215 to middle R. 216 136

(j) It was error of law to hold that the omission of du Pont affirmatively to repudiate the National Lead letter constituted du Pont a conspirator 137

(k) The District Judge was greatly influenced by his own mistake of fact in attributing to du Pont a phrase used by the Germans in their reply to National Lead, but not communicated to du Pont..... 139

PAGE

(l) What really happened in Germany, was that the Germans, in order to "go along with" National Lead, indulged in a little wishful thinking about du Pont, not supported by the terms of du Pont's letter..... 141

(m) And, regardless of what happened in Germany, it was error of law to base a decision on it against du Pont..... 143

Paragraph at middle R. 216..... 143

(n) Indeed, the District Judge expressly held that du Pont did no more than give expression to its then [1933] business policy not to export to Europe..... 144

Bottom R. 216 144

(o) A statement thus innocent in itself does not become unlawful because people abroad, unknown to the maker of the statement, proceed to act upon a misconstruction of it. 145

First paragraph, R. 217..... 145

(p) And the statement did not in fact have the effect that the District Judge imputed to it (elimination by agreement of competition between the two groups inside of Europe).. 146

(q) If the du Pont statement could have been anticipated to have any effect in Europe, it would have been just the opposite..... 148

(r) The District Judge drew the same inference from the oral testimony as from the documents—no promise by du Pont, only an explanation of du Pont's already existing policy 149

Middle R. 217 149

(s) du Pont had "valid unilateral reasons"—thus described by the District Judge—"for abstaining" from the fruitless effort to invade the European market of 1933. 150

PAGE

(t) The evidence was unequivocal that the Europeans remained discontented with du Pont's position, and that du Pont never changed it (from 1933 on) 152
Second paragraph, R. 217..... 152

(u) Jebsen, the principal architect of the conspiracy and principal witness in the case, explained that he never had more than a "hope" that du Pont might be induced to join, and that he never succeeded in bringing it into, the conspiracy 154

(v) And after 1933 repeated efforts to bring du Pont into line only resulted in failure. It remained outside the conspiracy. 163
Bottom R. 217..... 170

(w) The records of the Executive Committee governing du Pont were introduced in evidence. None showed any commitment to the conspiracy. All showed a preoccupation only with licenses under patents. 171
First paragraph, R. 218 171
Middle R. 218 173
Last paragraph, R. 218 and first, R. 219.. 174

2. The District Court's Heading III 174

(a) The District Judge made express findings that du Pont's purposes were to obtain technical information and immunity from patent infringement. These enabled it to compete more effectively with National Lead.. 175
Paragraph commencing bottom, R. 219. 175

(b) The District Judge's adverse characterization of "pooling" "to the exclusion of outsiders" rested on a single item of evidence which he himself recognized to have been effectively disavowed by its author, and therefore to be valueless..... 176

PAGE

(c) Moreover, that single item of evidence, authored by a du Pont subordinate, was overruled by two documents having the greater authority of two senior du Pont officials 177

(d) It was not open to the District Judge, having accepted the disavowal of the subordinate, to treat his views as "obviously" true, in disregard of the views of his seniors.... 178

Middle R. 220 179

(e) Du Pont's relations with Zirconium and Virginia Chemical were entirely independent of National Lead's, and were innocent.. 180

Paragraph bottom, R. 220..... 180

Paragraph top, R. 221..... 180

(f) The cross-license agreement conferred no power of concerted action and imposed no restraint 181

Paragraph middle, R. 221 181

Bottom R. 221 182

APPENDIX C—MEMORANDUM REGARDING THE PROTECTION AFFORDED IN CERTAIN FOREIGN COUNTRIES TO PROCESS PATENT CLAIMS IN CONNECTION WITH IMPORTATION INTO SUCH COUNTRIES OF PRODUCTS MADE BY A PROCESS PATENTED IN SUCH COUNTRIES 184

Supreme Court of the United States

OCTOBER TERM, 1946

E. I. DU PONT DE NEMOURS AND COMPANY,
Appellant,
vs.
THE UNITED STATES OF AMERICA,
Appellee.

No. 91

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE SOUTHERN DISTRICT OF NEW YORK

APPELLANT'S BRIEF

OPINION BELOW

The opinion of the District Court (R. 185)[1] is reported at 63 F. Supp. 513. Its final decree (R. 307) is reported at 63 F. Supp. 532.

JURISDICTION

The final decree of the District Court was entered October 11, 1945 (R. 316). This appeal was allowed by the District Court December 10, 1945 (R. 350).

---

[1]The record in the present case consists of two volumes containing the proceedings below which run from pages 1 through 1289 and four volumes of exhibits which run from pages 1 through 4399. "R." references are to the volumes containing the proceedings below and "Ex. R." references are to the volumes of exhibits.

Jurisdiction is conferred on this Court by Section 2 of the Expediting Act of February 11, 1903, as amended (32 Stat. 823, 36 Stat. 1167; 15 U. S. C. Sec. 29), and Section 238 of the Judicial Code, as amended (36 Stat. 1156, 38 Stat. 804, 43 Stat. 938; 28 U. S. C. Sec. 345). Probable jurisdiction was noted May 20, 1946 (R. 1289).

STATEMENT OF THE CASE

Proceedings Below. The Department of Justice commenced this suit June 24, 1944 (R. 1), pursuant to Section 4 of the Sherman Act (Act of July 2, 1890, c. 647, 26 Stat. 209, 15 U. S. C. Sec. 1 *et seq.*), to enjoin the operation of an international cartel in the titanium pigment industry claimed to be in violation of the anti-trust laws. Trial before Rifkind, *J.*, in the Southern District of New York, began December 4, 1944, and ended March 14, 1945 (R. 361-1175). Thereafter the parties filed proposed findings of fact and conclusions of law (R. 78, 119, 171). On July 5, 1945, the District Court filed its opinion (R. 185), and on October 2, 1945, its findings of fact and conclusions of law (R. 233). It held that a combination and conspiracy existed in the titanium pigment industry in violation of Section 1 of the Sherman Act (R. 306, 308), and entered a decree accordingly (R. 307).

The Appeals. The government and each of the three defendants below has appealed to this Court (R. 329, 334, 344). The government's appeal, No. 89, complains solely of the scope of relief granted by the District Court's decree (R. 330-331). The joint appeal, No. 90, of National Lead and Titan, Inc., which are affiliated companies, has been limited by their brief to questions relating to the scope of

relief (*cf.* R. 336-343). Du Pont's appeal, No. 91, complains as to the merits of the District Court's findings, as well as to the scope of relief (R. 344-350). All testimony and exhibits presented to the District Court are contained in the consolidated record before this Court (R. 356-359, 360).

The Decree and Partial Stay Pending Appeal. On October 11, 1945, the District Court entered a decree which in addition to cancelling the various contracts found to be illegal, subjects both existing and certain future patents and technical information of both du Pont and National Lead to compulsory licensing at reasonable royalties (R. 307). The decree also contains customary injunctive provisions. On application by National Lead, Mr. Justice Reed entered a partial stay on January 2, 1946. Paragraphs 5 (except as to an agreement between du Pont and National Lead dated January 1, 1933, as amended January 1, 1941, which we shall consider in detail *infra*), 8, 9, 10 and 11 of the decree were stayed. These relate principally to National Lead.

Industry's Basic Product and Its Characteristics. The case concerns a type of white pigment known as titanium pigments containing titanium oxide, a chemical compound, as an essential ingredient. Neither the nature nor purpose of such pigments is in dispute. The District Court found (FF 33, R. 245):

> "Titanium pigments and compounds are manufactured from titanium which is the ninth most abundant element on the earth's surface. Titanium is contained in ilmenite and other minerals. Sands and rock formations containing ilmenite are found in India, the United States, Norway, Brazil, and elsewhere throughout the world. Titanium pig-

ments are possessed of great opacity, hiding power and chemical inertness; and are largely displacing other pigments such as lithopone and white lead. Titanium pigments are used in the manufacture of paints and are also used in the manufacture of rubber, glass, paper, vitreous enamels, and many other products. Titanium pigments are sold in the United States and abroad in competition with other forms of white pigments, notably lithopone and white lead, which are sold in the United States in substantial quantities by a number of commercial concerns other than the defendants and some of which are sold by the defendants".

The raw materials for the manufacture of titanium pigments, principally ilmenite which is a mineral sand, are not the subject of this case. The District Court found that (FF 94, R. 303):

> "It is not claimed nor is there evidence that the defendants have controlled the supply of or restrained trade in ilmenite ore used in the commercial manufacture of titanium pigments in the United States".

Industry's Birth and Growth. The industry is of recent origin (FF 33, R. 246):

> "In and before 1920 there was no substantial trade or commerce in, and no commercial manufacture of, titanium pigments * * * ; pigments used for such purposes were lithopone, white lead and zinc oxide".

The growth of the industry, particularly in the United States, has been remarkable (FF 35, R. 247):

> "The production of titanium pigments in the United States has risen from 100 tons (on the basis

of pure TiO_2 content) in 1920 to approximately 110,000 tons in 1943 with a peak production of approximately 128,000 tons in the United States in 1941. The total production of titanium pigments and compounds outside of the United States has shown less growth, the estimated foreign production of titanium pigments and compounds being approximately 1,000 tons in 1920 and approximately 23,000 tons in 1938".

The industry does not sell to ultimate consumers, but to manufacturers, principally of paint, rubber, glass and other products (FF 33, R. 245).

The Case Affecting National Lead and Titan, Inc. The carefully prepared opinion and findings of the District Court[2] make it clear that this suit is divided sharply into two entirely separate disputes, the government opposing National Lead and Titan, Inc. in the one, and du Pont in the other. The principal subject matter of the trial below was the international cartel, called by the Department of Justice at the moment of commencing the case "a textbook cartel". This was the subject matter of the complaint and of practically the entire evidence.

The District Court found that National Lead[3] and Titan, Inc. were American members of a cartel[4] of titanium

---

[2]The District Court revised both its findings of fact and conclusions of law and its opinion to incorporate some of the suggestions made by counsel during conferences in chambers lasting over a period of more than a week.

[3]The District Court adopted certain initials set forth in footnote 1 of its opinion (R. 223) for the companies referred to throughout this litigation. For clarity, this brief employs instead the short form name of such companies.

[4]A collection of definitions of the term "cartel" are set forth in footnote 5 of the District Court's opinion (R. 224).

pigment producers which was world-wide (FF 64, R. 272). Other members were Titan companies in Germany, France, Great Britain, Canada and Japan (FF 44-63, R. 251-271). Each member of the cartel owned, or was licensed under, titanium pigment patents in various countries (FF 60, R. 270). The cartel had price and quota agreements with certain members of another combination of foreign titanium manufacturers, the Blumenfeld group (FF 66, R. 273, Ex. R. 178, 197, 221, 233).[5] Each of the members of the cartel was allocated certain countries as its exclusive trade territory and was licensed (with power to sub-license) under all patents belonging to every other member in such countries (FF 44, R. 251 at 253). All members of the cartel agreed to compel their sub-licensees and customers to abide by similar territorial restrictions. These restrictions were embodied in a basic

---

[5]Subparagraph (3) of Rule 27 of the Rules of this Court provides in regard to the form of briefs that if the reference therein "is to an exhibit both the page number at which the exhibit appears and at which it was offered in evidence must be indicated". It is not feasible here, however, to refer to any page as being the page at which a particular exhibit was offered in evidence because of the unique method by which exhibits were introduced below. The District Court summarized such method thus (R. 735-736):

> "THE COURT. Let me state on the record that counsel and the Court having conferred in chambers with respect of methods of expediting the trial of the issuance of this case, they agreed to mark all the exhibits tendered by the Government in evidence, reserving to each of the defendants respectively an objection to each and every exhibit so tendered, and that the exhibits being so deemed received in evidence shall then be commented on in rotation by counsel for the respective parties. And if there be an objection relating to the authenticity of a document or the authority of the author of the document to declare what is attributed to him, then such objection shall be taken at that time."

Contract of 1920 which will be considered under heading B of the Statement of the Facts below; and acceptance of the so-called "principles" of that contract became the test of membership in the cartel. All the foreign companies bound themselves to them.

The government's case against National Lead and Titan, Inc. concerns primarily the validity of this cartel under the anti-trust laws (R. 200). Throughout this brief du Pont assumes the validity of the District Court's holding that the National Lead group constituted a combination or conspiracy in violation of Section 1 of the Sherman Act.

The Case Affecting du Pont. As far as du Pont is concerned the trial presented a very narrow issue: Did du Pont join the cartel conspiracy? To settle a *bona fide* patent dispute (FF 72, R. 279), du Pont and National Lead entered into a written patent cross-licensing agreement in 1933 in respect of United States patents,[6] which agreement was consistent with the then recent decision of this Court in the so-called *Cracking* case, *Standard Oil Co. (Indiana)* v. *United States*, 283 U. S. 163 (1931) (R. 214). Neither in its complaint (R. 1) nor in its proposed findings of fact (R. 78) did the government contend that du Pont's patent license agreement with National Lead was illegal on its face. Instead, it urged that du Pont joined the National Lead combination by orally agreeing to subscribe to its principles (R. 23, 106).

---

[6] (R. 69) The actual parties were subsidiaries (The Titanium Pigments Company, Inc. and Krebs Pigment & Color Corporation); but no point is made of this fact in defense. Du Pont and National Lead collaterally agreed to conduct their titanium business through Krebs and Titanium Pigments Co., respectively, a provision obviously designed to prevent evasion of the parties' patent and information obligations.

The government's case against du Pont completely disintegrated almost from the outset. It is made plain throughout the findings and opinion below that du Pont was outside the cartel. The District Court expressly held that du Pont never subscribed either orally or in writing to the principles of the National Lead cartel (R. 213). In fact, it made an explicit finding that there was no promise or agreement of any kind on the part of du Pont which implicated it in the conspiracy (FF 73, R. at 287-288).

The trial resolved itself into a minute search day by day for anything in any of the documents that might possibly hold du Pont.[7] After a full and painstaking review of all the evidence, the District Judge found in one or two documents dated in 1933 but which were neither written by or to du Pont the only basis in the entire record for concluding that du Pont was a member of the cartel conspiracy. Even these letters, remote in time, ambiguous in their terms and context, and wholly diluted by testimony of those familiar with the events, were not deemed sufficient by the District Judge to support a finding of agreement or understanding, either express or to be implied from surrounding circumstance and subsequent conduct.

The District Judge was merely able to find that the cartel was strengthened by an alleged "assurance" given by du Pont at the time it entered into the 1933 cross-licensing agreement that export to Europe would not take place

---

[7]The parties facilitated, by stipulation, the introduction of documentary evidence (R. 370-375). Over 1400 exhibits were received in evidence (R. 232). The record in this Court (5688 pages) is primarily documentary, containing 809 pages of testimony, 4399 pages of exhibits and 480 pages of pleadings, etc. The exhibits were almost entirely those selected by the government from the files of the defendants which the government's representatives thoroughly culled.

(R. 217, 288), and that du Pont thereby became "a member of the combination—true, a special member, with a status, rights and obligations, different from that of the other members, but a member nonetheless." (R. 218). When du Pont gave this "assurance" it was not exporting to Europe and the District Judge expressly held that the so-called "assurance" given by du Pont was "no more than" a mere expression of its then existing export policy (R. 216) as to which it made no express or moral commitment that it would maintain in the future.

Du Pont contends that this statement of its current export policy was wholly proper under the circumstances and was reasonably necessary to enable it to obtain the non-exclusive licenses by means of which it established competition for titanium pigments in the United States. In the absence of any finding of agreement, express or implied, an essential element of conspiracy and combination is lacking and the case against du Pont should be dismissed.

STATEMENT OF THE FACTS

A.

Competitive Conditions Have Prevailed in the United States Since 1933

1. Du Pont's Entry Into the Industry and Patent Conflict with National Lead

Du Pont entered the titanium pigment business in the United States in the early 1930s (FF 10, R. 238), and, as will be seen, established itself as an arm's-length competitor of National Lead. It was aided in achieving this position through a series of negotiations which we will describe, culminating in a cross-license agreement involving United States patents which it entered into with National Lead in

1933. Its motive for entering the business arose from the fact that titanium pigments constituted a new form of white pigment which du Pont recognized to be of such growing importance in the chemical industry that it would replace du Pont's existing white pigment business (FF 70, R. 278).

Du Pont first attempted to manufacture titanium pigments by processes developed through its independent research (Ex. R. 986), but this proved impractical from a business point of view due to the already well intrenched patent position of the two American producers, National Lead and Commercial Pigments, a subsidiary of Commercial Solvents which had been set up to operate under the United States, but not under the foreign, Blumenfeld patents expiring in 1948 and thereafter (FF 34, R. 247, FF 37, R. 248, FF 70, R. 278). Du Pont accordingly determined to buy the assets of Commercial Pigments (Ex. R. 1051), an acquisition in and of itself not complained of in this proceeding.

Having acquired Commercial Pigments, however, du Pont still found itself unable to proceed economically with the manufacture of titanium pigments in competition with National Lead without infringing the cartel patents. Not only was Commercial Pigments involved in patent difficulties with National Lead but manufacture of titanium pigments by the Commercial Pigments processes alone would have resulted in a product having so much higher cost than National Lead's comparable product that it would not have been possible for du Pont to meet National Lead's price competition (Ex. R. 1353). Du Pont had, however, reason to believe that National Lead was infringing certain of du Pont's patents, and National Lead conceded this when it charged in turn that du Pont was infringing certain of

National Lead's patents (Ex. R. 1309, 1313-1314). There resulted what the Court found to be a *bona fide* patent conflict between du Pont and National Lead (FF 72, R. at 279).

This patent conflict was resolved only after extensive negotiation and exploration of technical processes and infringement claims which covered a substantial period of time (Ex. R. 1024-1025, 1028, 1089, 1150, 1172-1174, 1178-1183). Its resolution was embodied in the 1933 cross-licensing agreement.

The 1933 patent license agreement was fully in accord with the then recent decision of this Court in *Standard Oil Co. (Indiana) v. United States,* 283 U. S. 163 (1931) (*Cf.* the District Court's opinion, at R. 214).[8] Under this agreement the parties exchanged non-exclusive licenses under present and future patents and inventions relating to the titanium field and agreed to exchange technical information. Du Pont agreed to offer to any foreign associate of National Lead, before offering to anybody else, the opportunity to acquire a non-exclusive license for the licensed field under any of du Pont's present or future patents issued in Continental Europe and Great Britain. The agreement was subject to cancellation after December 31, 1933, on three years' notice.[9]

---

[8]The application of the *Cracking* case to the 1933 Agreement is discussed below at pp. 84-108.

[9]The agreement also provided for an exchange of releases of infringement for the benefit of the parties and their respective licensees. Each agreed to assist the other to obtain a similar non-exclusive license under any United States patent under which it itself was licensed but did not have licensing rights, under which provision no license ever were in fact acquired. Royalty payments were provided, which were in no event to exceed $40,000 to be paid by either party to the other in excess of the other's payments to it or to be paid by any party after 1936, and such royalties were in fact paid (FF 73, R. at 282).

The District Judge found that this agreement promoted "the more rapid development of the titanium business" and created "greater freedom of action for the parties under titanium pigment patents and developments" (FF 79, R. at 293). Du Pont took advantage of this greater freedom of action to compete vigorously with National Lead, and this competition assisted the rapid development of the titanium pigment business.

2. Commercial Competition

A. *Increasing United States Production.* United States production of titanium dioxide in 1944 was more than twelve times production in 1931, the year du Pont entered the titanium pigment business (Ex. R. 986). The following schedule details the growth of United States production in tons from the time of du Pont's entry into the field (Ex. R. 3786-3787, 3814, R. 1147):

Year	Du Pont	National Lead	American Zirconium and Virginia Chemical	Total
1931.....	825 (5 mos.)	9,767		10,592
1932.....	3,873	9,729		13,602
1933.....	5,511	8,445		13,956
1934.....	10,699	13,264		23,963
1935.....	20,027	18,483	2,206	40,716
1936.....	25,185	25,420	3,053	53,658
1937.....	37,530	28,468	3,616	62,614
1938.....	27,633	22,789	7,299	57,721
1939.....	35,305	38,340	9,295	82,940
1940.....	42,354	49,984	9,853	102,191
1941.....	50,674	64,035	11,967	126,676
1942.....	44,383	61,621	7,551	113,555
1943.....	42,843	61,502	6,673	111,018
1944[10].....	47,102	74,160	11,742	133,004

[10]Estimated on basis of first six months.

This production schedule reflects not only substantial increases made throughout the period in manufacturing capacity but also the keen competition which existed between du Pont and National Lead, as evidenced by the constant variation which took place in the percentage of the total market which du Pont was able to secure through its sales efforts.

B. *No Price Agreements.* The government threatened on several occasions to prove a price fixing case. This failed completely; and the Judge found that the prices established by du Pont and National Lead were not the product "of agreement or collusion" between them (FF 78, R. at 291). He found that "repeated reductions in the price of titanium pigments have taken place and a very few increases" (FF 78, R. 290). Price announcements were not made concurrently (R. 1150). There is no evidence that the contemplated price changes were even discussed between representatives of National Lead and du Pont in advance or that prior notice thereof was given by one company to the other. The testimony of company officials, who appeared and were cross-examined, was specifically to the effect that no arrangement, agreement or understanding of any kind in respect of price changes existed (R. 1077, 1168). There is substantial evidence of price competition (Ex. R. 4345-4360).

C. *No Division of Territory.* The District Court found that "There is no allocation of territory" between National Lead and du Pont in the United States or elsewhere (FF 78, R. at 291).

D. *No Allocation of Customers.* The government requested the District Court to find that there has been no

competition between National Lead and du Pont since the 1933 agreement (R. 110-111). To the contrary the District Court expressly found (FF 78, R. 290-291):

> "From 1933 on there was active competition between NL and DP for customers. * * * There is no allocation of * * * customers between NL and DP * * *".

Du Pont encountered competition from National Lead, Virginia Chemical and American Zirconium in the sale of its titanium pigments (R. 1158), as well as competition from other manufacturers selling large quantities of different forms of other white pigments, particularly lithopone and white lead (R. 1159, Ex. R. 3949). Included among such manufacturers were such companies as National Lead, Glidden, New Jersey Zinc, Sherwin-Williams and Eagle Picher (R. 1159).

Mr. Daley, General Manager of the du Pont Pigments Department, characterized the competition of National Lead as "plenty tough" (R. 1158), and the competition of Virginia Chemical and American Zirconium as "tough" (R. 1159).

Du Pont and National Lead each solicited the customers of the other and du Pont gained customers from and lost customers to National Lead (R. 1066, 1067, 1159, 1168, Ex. R. 4361-4363). Similar changes in accounts resulted as between du Pont on the one hand and Virginia Chemical or American Zirconium on the other by reason of similar sales competition (R. 1159, Ex. R. 4374-4382).

E. *Competition in Quality of Products.* The District Court found that du Pont and National Lead "each main-

tains a large, highly trained technical sales force engaged in endeavoring to sell titanium pigments" (FF 78, R. at 291). It further found (FF 78, R. at 291):

> "To a very large extent the salesmen of the two companies are chemists whose contact with consumers (that is, manufacturers of paint, rubber, glass, etc.) consists in endeavoring to demonstrate that their products merit acceptance on the basis of technical superiority".

The pigments are sold to many industries, but principally industries concerned with the manufacture and sale of paint, paper, rubber, cloth, flooring, etc. (R. 1055). The requirements of the users of titanium pigments vary greatly, not only as between industries but also as within a particular industry (R. 1155-1156). Thus du Pont has developed approximately 28 different grades of titanium pigment, each of which has distinct quality attributes. These pigments recognize such factors as dispersive properties in water, texture, opacity, hiding power, color retention, gloss properties, consistency and oil absorption, chalk and fade resistance, discoloration during baking, tinting strength, ease of grinding and other special properties, emphasized by a given use or manufacturing problem (du Pont Ex. 97).[11]

Differences in quality as between titanium pigments sold by du Pont and other titanium pigments constitute one of the most important areas of competition (R. 1078). Sales forces are technically trained to emphasize these distinctions, and du Pont utilizes special technicians who fol-

[11]This exhibit is not in the printed record but is on file in the Office of the Clerk of this Court and is a part of the record (R. 360).

low the salesmen and work closely, often for substantial periods of time, with du Pont's research staff and the customer or prospective customer in the development of pigments possessing qualities required by that specific customer (R. 1078).

The emphasis upon quality is also graphically demonstrated in the manufacturing operations of the titanium pigment manufacturers. Thus, in the case of du Pont numerous examples were presented of plant additions and improvements made for the purpose of meeting existing or projected quality competition presented by competitors (Ex. R. 4325-4360). Throughout these requests for appropriations to the du Pont Executive Committee run such phrases as: "our existing business will be seriously jeopardized unless we quickly place ourselves in position to meet this improved quality requirement" (Ex. R. 4325); "Project estimates are of high spot nature, due to speed necessary to place ourselves in competitive position" (Ex. R. 4330); "We consider it absolutely essential to install Mikronizers for dry grinding LO grades of TiO_2 at Baltimore in order to avoid a probable serious loss of business to a competitive manufacturer who would be in the position of selling TiO_2 with important quality advantages which would otherwise not be available to us" (Ex. R. 4332); "In recent months our principal titanium dioxide competitor has placed on the market several distinctly improved grades, combining better pigment dispersion, improved paint gloss, and lower grit (all very important properties), which grades have already cut in on some of our trade, and unless duplicated will make serious inroads on our established business" (Ex. R. 4338); "This project is wholly necessary for quality rea-

sons" (Ex. R. 4342); "The justification of the expenditure herein requested is wholly one of quality, due to advancement in the titanium pigment art, and necessary to maintain and better our competitive position" (Ex. R. 4358).

F. *Development of New Products.* The District Court found (FF 78, R. at 291):

> "NL and DP have endeavored to match each other's titanium products; but each also manufactures certain titanium pigments having special applications not manufactured by the other".

The development of new titanium pigment products of improved quality or designed for special uses is given great emphasis by du Pont, which employs over eighty research chemists to work on titanium pigments alone (R. 1160), and these chemists are constantly concerned with the improvement of products or the development of new products, having regular meetings and consultations through a New Products Committee, to which are appointed research, production and sales representatives (R. 1161).

3. History of Exchange of Technical Information between National Lead and du Pont, and of its Abandonment in 1940

As has been seen, the 1933 patent licensing agreement between National Lead and du Pont provided for an exchange of technical information between the parties (R. 70). The industry was still in its initial stage of development and the parties believed that it would be desirable to exchange information.

As the industry rapidly developed in the ensuing years (after 1933), each Company became progressively more

able to manufacture on its own, without access to the technical information of the other. Each developed a technical information of its own.

This development was reflected in a deterioration in the frankness with which each supplied technical information to the other. As time passed, the parties became more and more unwilling to continue the arrangement. An instance of withholding information established by the record occurred as early as January, 1934, when National Lead held back certain information from du Pont (Ex. R. 1841). On February 25, 1936, Dr. Booge, who was in charge of du Pont's titanium pigment research, recorded in a memorandum his impression that Mr. Turner of National Lead was withholding information, stating that this was "definitely the first time that this situation has developed" (Ex. R. 4311), meaning that this was the first time withholding had come to du Pont's attention. Beginning in 1936 there is also evidence that the relations between the technical representatives of the Companies were becoming less cordial and more reserved in respect of mutual disclosures of information (Ex. R. 1848-1876, 4314).

The scope of the exchange also became limited in one way or another. By 1937 the parties had officially narrowed the exchange of technical information in two important respects. They provided that no information was to be exchanged on new pigments and new grades of existing pigments until they were released for sale, and that only where authorization of $5,000 or more for new equipment had been made would research reports be exchanged (Ex. R. 1849, R. 903-904; Ex. R. 3086, 4314). Further limitation of the field of technical exchange occurred in 1939 and

early in 1940, when du Pont insisted upon a very strict interpretation of the licensed field of the agreement and advised National Lead that it insisted on eliminating exchange of processes and information relating to the production of extenders as opposed to titanium compounds (Ex. R. 1870-1900).

In April, 1940, du Pont advised National Lead that it was determined to withdraw completely from the exchange of technical information (Ex. R. 1926-1931); and on April 29, 1940, a formal letter canceling the exchange of technical information as of May 1, 1940, was sent by Rupprecht on behalf of du Pont to National Lead and accepted by the latter (Ex. R. 1942). Subsequent to that date no technical information was exchanged between the parties (R. 907, 1167, Ex. R. 4321), and the elimination of the exchange of technical information was formalized in an amendment dated as of January 1, 1941 (R. 73, 1166-1167).

The District Court found (FF 75, R. 289-290):

> "As of about May 1, 1940, the exchange of technical information between NL and DP was discontinued; and the 1933 agreement between TP and Krebs, which had been assumed by NL and DP, respectively, was, by an agreement between NL and DP dated January 1, 1941, (Ex. E-3) amended to eliminate provisions for exchange of technical information".

4. Du Pont's Licensing Policy and Practice

A. *No Refusal to License Under its Patents.* In addition to licensing National Lead, du Pont licensed American Zirconium and Virginia Chemical under titanium pigment patents, including the important rutile patents. The District

Court found that "No other company or person requested such a license from DP" (FF 83, R. 295).

B. *Licenses to Virginia Chemical.* The government charged in its complaint that du Pont and National Lead agreed they would utilize the threat of infringement proceedings to compel Virginia Chemical to accept a license and that before du Pont granted this license to Virginia Chemical it secured the approval of National Lead to the terms thereof (R. 29). At the trial the government likewise sought to have the District Court find that there was joint action taken by du Pont and National Lead against Virginia Chemical (R. 108). To the contrary, the District Court found that:

> "There is no evidence that the action of NL and DP with respect to VC was the result of agreement between NL and DP" (FF 85, R. at 298).

It also found that "VC was organized in 1935 to manufacture titanium pigments in the United States", that "DP notified VC of its patent holdings in the titanium field", that "Negotiations followed which resulted in an agreement, Ex. L, executed August 15, 1937", that "By this agreement DP granted VC a non-exclusive license under a specified list of U. S. patents subject to royalty payment on all production of TiO_2 and subject to limitation on the quantity produced under the license ranging from 3000 tons of TiO_2 content for the year 1937-8 to 9000 tons for 1946 and any year thereafter", and that "VC granted DP a non exclusive, royalty free license under a named patent" (FF 85, R. 297). It further found that "In November, 1940, DP granted VC a similar license under another patent in this field for an additional royalty", that "On July 22,

1943, DP granted VC a similar license under its patents for rutile pigments, without additional royalty", and that "In November, 1944, DP cancelled the quantity limitations in the licenses" (FF 85, R. 297).

C. *Licenses to American Zirconium.* The District Court found that "Early in 1934 Zirconium, which was owned by Glidden Company and by Metal and Thermit Corporation in equal shares, began to manufacture titanium dioxide. It owned some patents relating to such manufacture which it had acquired from its parent corporations" (FF 84, R. 295). Continuing the theme of collusion between National Lead and du Pont, the government charged in its complaint (R. 27), and at the trial urged the District Court to find (R. 107-108), that du Pont and National Lead agreed that they would use the threat of infringement suits to compel Zirconium to accept the license agreements from them and that they further agreed on the terms of the license agreements which they separately granted Zirconium. The District Court refused to make this finding and held instead (R. 198):

> "NL and DP *severally* notified American Zirconium that it was probably infringing".[12]

It also found (FF 84, R. at 296):

> "The evidence does not warrant the inference that the licenses granted by DP to Zirconium and the cross-licensing agreement between NL and Zirconium were made pursuant to a common plan of NL and DP or as a result of concerted action by them."

[12]Italics ours throughout the brief, unless otherwise indicated.

Du Pont commenced its negotiations with Zirconium on January 8, 1934, almost five months before National Lead made its first contact with it (FF 84, R. 295, Ex. R. 1651, 1656). The license arrangements made by du Pont and National Lead were wholly different in form and substance.

The District Court described National Lead's license as "an agreement dated May 6, 1935, Ex. H, whereby NL in lieu of royalties received 10% of the stock of Zirconium, had its president elected to Zirconium's Board of Directors, and NL and Zirconium cross licensed each other under all patents in the titanium pigment field, then owned or thereafter acquired, and both parties agreed to exchange technical information and experience" (FF 84, R. 295). The District Court found that "Zirconium assumed obligations substantially like those of Article XIV of the 1920 agreement, Ex. A, including restrictions on its exports" (FF 84, R. at 296. The 1920 agreement, Ex. A, is described *infra*, pp. 24-25). In other words, the Court found that Zirconium itself did what the Court found that du Pont would *not* do, viz., agree and obligate itself to the restraints imposed by the "principles" of the cartel as the price for obtaining patent licenses from the cartel. On the other hand, du Pont's license (which was executed on August 19, 1935, more than three months after the execution of National Lead's license) merely "granted Zirconium a non-exclusive license under specified patents, for the life of the patents, subject to the payment of a royalty on all TiO_2 produced and subject to a limitation on tonnage of 3,000 tons in 1935, to 9,000 tons in 1944 and thereafter, of titanium dioxide produced under the license" (FF 84, R. 295).

There was no connection between du Pont and any of the foregoing relations between National Lead and Zir-

conium. The District Court found that "On March 7, 1943, DP licensed Zirconium under additional patents without additional royalty" and that thereafter (as in the case of its licenses to Virginia Chemical) du Pont terminated all tonnage limitations under its licenses in November, 1944 (FF 84, R. 295).[13]

B.

Creation and Operation of the Cartel—du Pont not Concerned in This

1. Introductory

There is no substantial suggestion in the record or by the Court that du Pont had any part in the activities described under this heading B. They were discussed by the District Judge in his opinion under a separate heading (R. 200) entitled "The Case Against NL and Tinc", and with no reference to du Pont.

Yet the cartel was the essential subject matter of the case; and the government commenced the case on the charge that du Pont was a genuine member of the cartel just as was National Lead. This was no mere "part" of the case against du Pont; it was originally *the* case against du Pont, and with its collapse the complaint against du Pont might more fairly have been dismissed.

The government has followed a different course. Defeated on the central issue, it has clung on to a subsidiary issue—that du Pont, in accepting a patent license from the cartel, gave it aid and comfort. In its defense against this issue, a description of the cartel becomes important to du

[13]For a detailed statement of the modification of the Virginia Chemical and Zirconium licenses, see pp. 102, 105 below.

Pont itself, not because du Pont was involved in it, but because it shows what du Pont as a new competitor in a new industry had to face.

The Judge found that du Pont made *no agreement* to become a member of the cartel. Our first point in argument is that this is conclusively in favor of du Pont on the merits, as an agreement is necessary under the anti-trust laws.

In the absence of agreement, the question as to how du Pont or any other new competitor was to defend itself in a cartelized industry is a question of the reasonableness of what it does. It must be measured against the very fact that it has been confronted with the situation which we now describe.

2. The Conspiracy

The cartel conspiracy was formed on July 30, 1920, by the Contract of 1920 between Titanium Pigment Co. and Titan A/S (R. 187). This agreement set forth in Article XIV in explicit terms the basic structure of the cartel scheme. It provided:

> (a) For the assignment of North America to Titanium Pigment as its exclusive territory, and of the rest of the world (except South America which was to be common territory) to Titan A/S;
>
> (b) For a patent exchange of present and future patents to conform to the foregoing territorial assignments;
>
> (c) That neither company would ship into the other's territory without its consent;
>
> (d) That each company would prevent exportations into the other's territory of finished articles containing titanium;

(e) A restriction on the granting of licenses, not only under the patents of the other but under its own, unless the licensees agreed to accept the obligations and restrictions of the Contract of 1920.

In the years which followed, the principles of this Contract served as a guide for the members of the cartel. The development of the cartel involved the execution of more than 60 agreements which closely interlocked National Lead and the various foreign manufacturers (R. 188). It was these agreements which the District Court stated in its opinion "confined the international trade in titanium products within the preordained channels where-through it moves only by the grace and under the regulation of NL and its foreign associates" (R. 192). The cartel was in a position to strike down any incipient independent competitor. The network of agreements established private trade barriers around clearly defined territories. No member of the cartel dared trespass into territory allotted to others. All commerce between territories in titanium products was forbidden except by mutual consent, and this suppression of commerce involved not alone patented articles or articles produced by patented processes but all products in the titanium pigment field (R. 191).

In considering du Pont's unique problem at the time the 1933 agreement was executed, it is worth emphasizing the sources of this tremendous power. The power rested not alone upon private trade agreements. It was strongly bolstered by patents, tariffs, the size and influence of the participating units, state subsidies, and control of raw materials.[14]

---

[14]For a discussion of the factors which shaped du Pont's export policy, see pp. 43-46 below.

By the time the 1933 patent licensing agreement between du Pont and National Lead was executed, for example, there were two groups of manufacturers of titanium pigments (FF 37, R. 248). They had consolidated their efforts in every important industrial community in the world except the United States and had full control of essential patents and technical information. The first group was founded upon the Barton-Rossi and Jebsen patents. All the members of this group subscribed to the principles of the Contract of 1920, which according to the District Court was evolved "to prevent competition between the parties to the agreement and between their respective sublicensees and between each of the parties and the sublicensees of the other" (FF 46, R. 255). Participating members were intrenched in France, Germany, the British Empire, and later in Japan, Canada and Newfoundland (FF 49-56; R. 256-267).

The other group, based upon the so-called Blumenfeld patents, consisted of important companies in various countries, including England, France, Austria and Italy (FF 37, R. 248). These companies had also allocated territories and cartelized activities among themselves. The two groups were bound together by a significant series of agreements which were already under way at the time the 1933 patent license agreement between du Pont and National Lead was executed. Indeed, the first of these agreements which formed the pattern, an agreement between Aussig (the Blumenfeld company in central Europe), and Titangesellschaft (the National Lead associate in central Europe), had been settled by June 19, 1933 (Ex. R. 1474). Thereafter, supplementary agreements, fully outlined in the District Court's findings (FF 66, 67, R. 273-277), were completed and embraced both patent arrangements and quota understandings.

The two closely knit groups also developed machinery through International Sales Committee meetings for policing the markets, reviewing trends, enforcing quotas, all for the purpose of excluding competitors, as illustrated by reports of these meetings spread upon the record (Ex. R. 2885, 2892, 2915, 2917, 2932).

We will not burden this brief with a detailed chronological statement of the development or with a review of all manifestations of the complete authority and blanketing of the titanium pigment industry resulting therefrom. It suffices here to say that it was established by the government at the trial beyond doubt that the cartelized condition, briefly summarized above, was firmly rooted in the industry at the time du Pont acquired Commercial Pigments and thus entered the titanium pigment business (FF 37, R. 248). Du Pont, as the District Court found, was not a party to the various contracts and agreements which interlocked and solidified this cartel. Indeed, du Pont had but little knowledge of the cartel's activities and took no part in the negotiation, execution or performance of the various agreements by which the cartel was intrenched. The record is replete with evidence that the cartel functioned without consulting or communicating with du Pont and treated du Pont as an outsider, as in fact it was.

C.

Unsuccessful Efforts to Bring du Pont Into the Cartel

1. Consent of National Lead's Foreign Associates to the 1933 Patent Licensing Agreement

A. *Requirement of Obtaining Such Consent.* Du Pont was a wholly free and independent agent in the negotiations

which led to the 1933 patent licensing agreement, but National Lead was not. National Lead was bound by its pre-existing cartel contracts with its foreign associates which prevented it from entering into any arrangement with du Pont without their approval and consent. Specifically, National Lead was obligated by the principles of the Contract of 1920 not to agree to a non-exclusive contract, unless territorial restrictions should be included. The District Court described the situation thus (FF 73, R. 280):

> "Contract Exhibit A by its terms prevented TP from entering into a contract with Krebs unless Krebs subscribed to the provisions of Article 14 of Contract Exhibit A and particularly unless Krebs agreed not to export into the territories of NL's foreign associates and unless Krebs agreed to grant exclusive licenses to NL's foreign associates under all its present and future patents for titanium pigments and compounds in the territories of the foreign associates".

In 1933 the cartel was already at practically full strength.[15] It was in full command in the two principal industrial centers of Europe—Germany and Great Britain—and had an important operating subsidiary in France and

---

[15]In 1933 National Lead's immediate foreign associates were Titan, Inc., Societe du Titane (France), British Titan (Britain) and Titangesellschaft (Germany). Jebsen was Titan, Inc.'s active executive (Ex. R. 514); National Lead owned 87% of Titan, Inc.'s stock (FF 4, R. 236). Titan, Inc. owned 78% of the stock of Societe du Titane (FF 49, R. 256). Imperial Chemicals, Goodlass Wall and Imperial Smelting, being together all the principal companies in the British chemical industry, each owned 17% of British Titan's stock, and the remaining 49% was owned by Titan, Inc. (FF 20, R. 241, FF 21, R. 242, FF 52, R. at 260). Titan, Inc. and I. G. Farbenindustrie jointly owned all of Titangesellschaft's stock (R. 193).

through National Lead had a dominating position in the United States.

No competitor could enter the field in the United States without infringement of the cartel-controlled patents unless it either would accept "the principles" of the cartel or could, through some counter-strength or persuasion of its own, move the cartel to back down from its requirement (as du Pont did).

B. *Du Pont's Refusal to Make Illegal Commitment During Negotiations Culminating in the 1933 Patent Licensing Agreement.* British Titan, the English associate, consented to the execution of the 1933 cross-licensing agreement as written as early as May 29, 1933 (Ex. R. 1488). Titan, Inc. and Societe, the French associate, consented through Jebsen (R. 962, 992). I. G. Farbenindustrie, the German associate, however, at first refused to consent (Ex. R. 1479-1480), but, after much correspondence, finally did consent (Ex. R. 1513). The history of how and why I. G. Farbenindustrie consented,—whether in effect I. G. Farbenindustrie gave in to du Pont (as we contend), or du Pont gave in to I. G. Farbenindustrie and thereby accepted the cartel "principles"—is the central battleground in the du Pont case. It is on the basis of such negotiations that the District Court held that du Pont joined the illegal combination and conspiracy of the National Lead group (R. 215, 280-289).

While there is no evidence that du Pont ever saw the 1920 Contract, the District Court found that "NL advised DP of its contracts with TAS in May of 1932 and of the restricted nature of said license agreements" (FF 72, R. at 279). But du Pont declined from the outset of such negotiations to adhere to the principles of the Contract of

1920 and specifically refused to agree to refrain from exporting into the territories of National Lead's foreign associates or to grant them at that time exclusive licenses under its foreign patents. The District Court recognized this (R. 214), and its essential inquiry was into the *reasons* that du Pont assigned for its refusal. What the District Court held, was that "The reasons assigned by DP for its refusal were several, and varied from time to time, but always conspicuous among them was the claim that its adherence was forbidden by the anti-trust laws" (R. 214).[16]

National Lead was eager to reach some form of agreement with du Pont (R. 213). Its first outline of a proposed cross-licensing agreement was inconsistent with the principles of the 1920 agreement in that it sought no commitment from du Pont limiting its exports. In submitting to Jebsen such outline on February 2, 1933, National Lead noted that, if the agreement was accepted by du Pont, "the Titanium Pigment Company will take the necessary steps to bring about an amendment to the license agreement of 1920 between the Titanium Pigment Company and the Titan Company A/S which will permit said cross-licensing without imposing the burdens upon the Krebs Corporation which said license agreement of 1920 would otherwise impose" (Ex. R. 1426).

National Lead foresaw advantages resulting from an agreement with du Pont even though it was inconsistent with the territorial and other provisions of the 1920 agree-

---

[16]Thus when du Pont acquired Commercial Pigments, it found that the latter company was obligated by contract to refrain from selling abroad. Du Pont refused to assume such contractual obligations and refused to make any renewal of such agreement with the other contracting party, Blumenfeld (FF 73, R. at 289).

ment (R. 213). The District Court, however, properly pointed out: "NL's motives for this eagerness are not too important. It matters little whether it sought the reciprocal advantage of DP research; or whether it feared DP's hostile competition more than it feared its less friendly, though competitive, collaboration; or whether it anticipated that NL and DP together would constitute an alliance so formidable as to preclude any other important competition" (R. 213-214).

National Lead considered that there was no *practical* justification for any interference by its foreign associates in its obtaining this non-exclusive cross-license agreement with du Pont. National Lead did give some consideration to the territorial problem but apparently felt it was not of major consequence. G. W. Thompson of National Lead wrote Jebsen in February, 1933, stating explicitly: "It is obvious to me that the Krebs Corporation could not possibly do a profitable export business where our European titanium pigment manufacturers have costs so much lower than we have in the United States" (Ex. R. 1422). A month later, in March, 1933, he again stressed the commercial impracticability of titanium pigment exports in referring to the concern of National Lead's foreign associates over the possibility of foreign competition from Krebs: "This [the lack of any territorial commitment by du Pont] may be more of a mare's nest than a reality because I can not conceive how any product, for many years to come, in the Titanium line can compete in cost with foreign products" (Ex. R. 1443).

Some of the Europeans did not see the matter in the same light, however. The Germans insisted upon adherence by du Pont to the cartel principles. The "deviation"

between the proposed du Pont non-exclusive agreement and the cartel "principles" was so substantial as to shock Jebsen, the author and guiding spirit of the 1920 Contract (R. 1003), as he was prompt to make clear in two letters written to National Lead's Thompson from Europe under date of March 1, 1933 (Ex. R. 1430, 1436).

Thompson recorded in a memorandum his impressions upon reading Jebsen's letters (Ex. R. 1443). He there stated: "It is very doubtful if we could directly bring Krebs into fully accepting the fundamental principle Jebsen refers to" and noted the advantages which would, nevertheless in all probability, accrue directly to National Lead, and perhaps indirectly to National Lead's foreign associates, under the agreement proposed.

On April 8, 1933, Rupprecht, President of Krebs, sent to Beschorman, who by this time had taken charge of the negotiations on behalf of National Lead (R. 990-991), the cross-licensing agreement in the form in which it was subsequently executed, and on the same day submitted the agreement to du Pont's Executive Committee for approval (Ex. R. 1451). The agreement contained none of the provisions which Jebsen felt should be included, i.e., it did not compel Krebs "to refrain from sales outside U. S. A. or North America" or commit it to "technical cooperation outside North America" with National Lead's foreign associates.

After Rupprecht sent Beschorman the proposed agreement in final form, the latter took it with him on a trip to Europe in the Spring of 1933 (R. 960, 988). According to Jebsen, Beschorman insisted throughout this trip that "we have got to sell the agreement to the Germans" (R. 960, 988, 1028). Beschorman was "a very self-willed per-

son" (R. 960, 991, 1028) who did not, in Jebsen's view, comprehend the implications of the 1920 Contract (R. 962), and wasn't interested even in discussing it with him because his relations with Jebsen were apparently not cordial at the time (R. 960, 988, 1028). Although Jebsen was discouraged by the fact that he could not convince Beschorman not to enter into an agreement with du Pont because it did not conform to the principles of the Contract of 1920, he finally decided that it was to his best interests, since he was an employee of National Lead, to help Beschorman's efforts to sell the proposed agreement to the Germans (R. 962, 992).

Jebsen and Beschorman presented the proposed agreement to Kuhne of I. G. Farbenindustrie who "just said that the legal department would go through it and then answer it" and then indicated in addition that he "had no doubt that the thing would be all right because National Lead Company was fifty per cent interested in the German Company, and so on" (R. 961, 988). Kuhne proved to be over-optimisitc.

Later Jebsen conferred in Frankfurt on July 19, 1933, with Kuhne and I. G. Farbenindustrie's lawyers, all of whom refused to consent to the proposed agreement (notwithstanding Jebsen's efforts to make them do so) on the ground that it did not conform to the principles of the Contract of 1920 of benefit to I. G. Farbenindustrie (R. 961, 989-990). A few days later Jebsen advised Beschorman that I. G. Farbenindustrie "put forward exactly the same points" which he had laid down in one of his letters of March 1 to Thompson (Ex. R. 1475) thus noting I. G. Farbenindustrie's concern that the proposed agreement did not conform to the principles of the 1920 Contract. Meanwhile, I. G. Farbenindustrie set forth its objections to the proposed agreement in a letter to Jebsen (Ex. R. 1479):

"We have carefully examined how this contract affects the interest-sphere of Titangesellschaft, and it seems to us, that at least one important point in the new contract has not been clearly expressed, namely that Krebs unconditionally have to respect the territory reserved Titangesellschaft in the License Agreement of October 1927 between Titan Co. A/S and Titangesellschaft, that is that Krebs

"a) shall not themselves manufacture in the territory of Titangesellschaft,

"b) shall not make deliveries in this territory,

"c) shall also impose upon their customers a corresponding obligation not to deliver in this territory,

"d) shall grant sublicenses only to undertakings outside this territory and for use outside of this territory,

"e) shall strictly observe the same limitation as under d) also regarding the experiences of which they get knowledge and which originate from Titangesellschaft.

"We consider it of the greatest importance to have this point made clear, as otherwise the unbearable situation may arise for the Titangesellschaft, that Krebs compete with Titangesellschaft in the latter's territory, with T.G.'s own patent-rights and experiences which are transmitted to Krebs through Titanium Pigment Company."

On June 22, 1933, Jebsen cabled Beschorman advising him of the substance of I. G. Farbenindustrie's objections (Ex. R. 1472). Beschorman did not send Rupprecht a copy of either I. G. Farbenindustrie's letter or Jebsen's

cable but instead sent to Rupprecht a portion of Jebsen's cable which read as follows (Ex. R. 1473):

> "Agreement Krebs acceptable to I G Farbenindustrie provided clearly expressed by Krebs in some form that they will respect Titangesellschafts territory not manufacture there make no deliveries direct or by customers give no sublicenses and no technical aid for manufacture within or for that territory Stop I G considers three years agreement short in view of parting with experience and suggests five years but makes it no condition Stop I Gs reservations should also apply Titan Incs territory."

Jebsen's cable to Beschorman noted that he would leave Europe for New York on July 1, 1933, but Beschorman did not pass on this information to Rupprecht (Ex. R. 1472, 1473, R. 961, 990), and before Jebsen arrived Rupprecht had written to Beschorman a letter dated June 28, 1933, stating, in polite but firm language, du Pont's refusal to change the written contract for the purpose of meeting I. G. Farbenindustrie's objections and giving his reason: that such changes would make the arrangement in violation of the Sherman Act (Ex. R. 1483). This is one of the two crucial letters in the case as far as the District Judge's findings adverse to du Pont are concerned. The letter is discussed and analyzed at some length in subsequent portions of the brief and its full text is set forth in Appendix A.

In an intra-office contemporaneous memorandum to an official of du Pont, written at the same time, Rupprecht noted that he had talked several times with Beschorman on the subject, and that Beschorman felt that Rupprecht's letter "should take care of the situation" (Ex. R. 1485).

Rupprecht's position in his conversations with Beschorman is made clear by the following quotation from the memorandum:

> "I told him that it was a selling job for them to make I. G. realize that they were putting their interests in National Lead's hands, and that they would be well taken care of. Mr. Beschorman told me that when he saw Dr. Kuhne, in charge of the I. G. Titanium Plant at Leverkusen, Germany, the latter definitely said that it all seemed o.k. to him and he would write a letter of approval. Instead of the letter of approval, this cable was received.
>
> "There is no further move to be made now as the next step is up to National Lead. * * *"

And in another contemporaneous memorandum he noted concerning his letter that Beschorman "seemed to feel this ought to take care of the situation, so we now have to sit back and leave the rest to them" (Ex. R. 1487).

Beschorman did not send Rupprecht's letter to I. G. Farbenindustrie immediately on receipt; instead he prepared a letter dated July 12, 1933 (Ex. R. 1496), set forth in full in Appendix A to this brief, which Jebsen eventually enclosed, together with Rupprecht's of June 28, in a letter which Jebsen wrote to I. G. Farbenindustrie on July 21, 1933 (Ex. R. 1495). Beschorman showed his letter to Rupprecht and sent him a copy for Krebs' records before it was sent to I. G. Farbenindustrie (FF 73, R. at 287). There is no evidence as to what, if anything, Rupprecht did about the Beschorman letter. Rupprecht died before the trial (R. 283, 1152); and neither the government, which of course had the burden of proof, nor National Lead, whose officer Beschorman had been, called the

latter as a witness. He was in fact seriously ill, and has since died.

In the interim, on arriving in New York, Jebsen resumed his attempts to get Beschorman to persuade Rupprecht to subscribe to the principles of the Contract of 1920, but his efforts fell upon deaf ears (R. 1028-1029). Jebsen also had one meeting with Rupprecht, at which he himself attempted to persuade Rupprecht to subscribe to the principles of the 1920 Contract (R. 961, 1042). Neither at this time nor at any other time did Jebsen ever succeed in obtaining Rupprecht's oral or written agreement to adhere to such principles (R. 961-2). Rupprecht explained to Jebsen in definite terms that he could not do so (R. 993-994, 1030-1031). Jebsen found that Rupprecht was "too slippery" (R. 961); had "too many answers" (R. 993); was "evasive" (R. 998); was "a man you never could pin down to anything" (R. 1002, 1044); and never got down "from sound to things" (R. 1032). He, therefore, came away from the conference not feeling "happy" (R. 994, 1033, 1035) but "hoping that as time developed I might be able to get him to understand and sooner or later fall in line" (R. 995). Jebsen was also feeling "uncertain about the future" (R. 1033), was not "satisfied" (R. 1043-1044) and was thinking that "we would have to take a chance" (R. 1031).

Jebsen in writing to I. G. Farbenindustrie after his meeting with Rupprecht (Ex. R. 1495) made an effort, similar to the effort made by Beschorman in his letter, to persuade I. G. Farbenindustrie that du Pont would not act in a manner detrimental to I. G. Farbenindustrie's interests, but none of their letters purported to state that du Pont had in fact subscribed orally or otherwise to the 1920 Con-

tract. Like Beschorman, Jebsen was attempting to sell the agreement to the Germans (R. 959-960, 1029, 1036-1040). Jebsen testified that his letter (Ex. R. 1495) was merely a recommendation to the Germans that the best thing to do "was to go ahead and take a chance in the matter" (R. 1038, 1052, 961). Jebsen did not represent I. G. Farbenindustrie's interests at any time during the negotiations (R. 992, 996). The Germans fully appreciated that he was free to advocate National Lead's viewpoint (R. 1034-1035, 1036-1039, 995-996). Jebsen testified that "if there had been any oral understanding" during his visit to the United States "it would be natural for me to go to the Germans and explain that" (R. 1021-1022). He did not do that on his return to Europe (R. 1021-1023). On August 7, 1933, I. G. Farbenindustrie consented to the proposed agreement in a letter to Jebsen (Ex. R. 1513), who was then back in Europe, which concluded, wholly without justification and presumably to save face in view of its prior objections, that Krebs "will loyally respect the territorial delimitations as regards manufacture, granting of licenses and sale" in accordance with the basic agreements of Titan, Inc. and Titangesellschaft (FF 73, R. at 288). The District Court found that "There is no evidence that the aforesaid construction was communicated to DP" (FF 73, R. at 288).

On August 28, 1933, Exhibit E was executed by Krebs and Titanium Pigments Co., as subsidiaries of du Pont and National Lead, in the form originally submitted by du Pont on April 8, 1933, prior to which time it had been approved by du Pont's Executive Committee.[17]

---

[17]The 1933 agreement was attached as Exhibit A to du Pont's answer (R. 69); it became Exhibit E at the trial (R. 280).

2. *Du Pont Remained Independent During the Period Subsequent to 1933.* The conduct subsequent to the execution of the 1933 patent licensing agreement need only be briefly summarized here, inasmuch as the District Judge, in spite of the government's urgings, failed to find in it evidence sufficient to support a finding that du Pont entered the cartel conspiracy either in 1933 or at a later date. We have already shown that following this agreement a highly competitive situation developed in the United States titanium pigment market, du Pont and National Lead competing not only with each other but with the two other producers in the field, without division of customers or territory and without price agreement or other restrictive practices.

And that neither National Lead nor its foreign associates regarded du Pont as one of the group, is evident from their files subsequent to the execution of Exhibit E which disclose beyond any question that they were constantly seeking unsuccessfully to persuade du Pont to join forces with them. Thus, in the Summer of 1934, Jebsen wrote to Beschorman stating (Ex. R. 2938):

> "In these matters of technical co-operation, we have, as you know, laid down and established very definite rules between our various associated companies. The basis for co-operation with DuPont is somewhat different and by far not so defined."

On January 4, 1935, Jebsen again wrote to Beschorman in a form clearly indicating that at that time he did not consider du Pont to have subscribed to the principles of the 1920 Contract (Ex. R. 2953-2955):

> "At present we have a better opportunity than at any other time to bring Krebs to our views, be-

cause of their infringement of Titan Co.'s patents, later it will be more difficult because on the one side Titan Co.'s opportunities of making new inventions are lessened and our German and English associates with larger staffs in close contact with actual production are increasing.

"Our aim should be to get the relations with Krebs as far as possible in line with the ideas and conditions laid down in Article XIV of the license agreement of 1920 * * *."

Nothing could have resulted from this, either, for in August, 1937, Jebsen again wrote, this time to National Lead's Kaegebehn, stating: "I hope that DuPont also will come in line and realize the advantage of our co-operation in the whole Titanium field" (Ex. R. 2521), and there was other correspondence in the same year to the same effect (Ex. R. 2536).

The government emphasized the fact that du Pont entered into license agreements with Titan, Inc. (Ex. R. 406, 412, 455, 470, 486), in the years 1937, 1938, 1939, 1940 and 1941. But admittedly these agreements related only to specifically identified patents and were licenses only. None of them precluded du Pont from utilizing its foreign patents abroad, and each of them was negotiated separately pursuant to the provisions of Article V of the 1933 agreement.

The Court considered whether this Article had been in any degree modified by subsequent oral understanding, and found an oral understanding to exist (FF 89, R. at 301) which, however, was not in itself illegal or sufficient to make du Pont a conspirator. While the finding as to the oral understanding is not supported by the evidence (e.g. Ex. R. 3056-3058), we do not stress this point, since it was of no

major consequence in the ultimate decision (R. 213, FF 73 at R. 289). The finding, such as it was, seems to have been based on a misreading of a negotiation in 1938.

Jebsen came to the United States on May 17, 1938 (R. 760). He was still dissatisfied with the relations between the Titan Companies and du Pont because the principles of the 1920 agreement had not been accepted (R. 1039-1040), and he determined to make another attempt to get "Rupprecht into line" (R. 1041). He also found it both annoying and inconvenient to clear each specific license agreement with National Lead's foreign associates and he thought it would be highly desirable to arrange a general agreement between du Pont and National Lead (R. 1040-1041).

Jebsen and Kaegebehn of National Lead had two meetings with Rupprecht during Jebsen's brief stay in the United States (R. 771). The first of these meetings took place on June 3, 1938, in National Lead's offices (R. 771). At this meeting the idea of any general agreement was abandoned after Rupprecht specified the refusal of du Pont's Legal Department to sanction such an arrangement (R. 779-781).

A subsequent meeting was held in Rupprecht's office in Wilmington on June 8, 1938, at which some final details with respect to a specific du Pont-Titan, Inc. patent license agreement were considered, and the negotiations came to an end (R. 771, 778, Ex. R. 3077). Jebsen returned to Europe soon after the June 8 meeting (R. 778).

The upshot of his negotiations had been that he had failed to obtain any satisfaction from du Pont, which continued to refuse any general cooperation. The most that Jebsen was now reduced to seeking was that du Pont should

not, in licenses (individually negotiated) to European companies, reserve rights to itself. Even this was refused.

Rupprecht's memoranda submitting each of the patent licenses to du Pont's Executive Committee for approval also show that the reservation of du Pont's rights was genuine. Rupprecht stated, when recommending approval of the first of them (Ex. R. 4221):

> "Since the patents covered by this agreement offer little possibility of return, this agreement will permit the Company to maintain these patents without expense, and it is, therefore, recommended that the Management be authorized to execute the license as herewith submitted."

And when recommending approval of the second (Ex. R. 3044):

> "Since the patents covered by this agreement offer very little possibility of return, the agreement enables the Company to maintain the patents without expense to us, and also retain all rights of manufacture and sale for the Company in the countries mentioned."

And when recommending approval of the third and fourth (Ex. R. 4224, 4226, 4228, 4236):

> "Titan Company, Inc., assumes all costs incidental to the filing and prosecution of our applications under this license; pays all necessary maintenance fees during their life; and cannot permit abandonment without our approval. * * *
>
> "* * * we retain all rights of manufacture and sales for the Company under our foreign patents, without any filing or maintenance costs."

And when recommending approval of the fifth (Ex. R. 4241, 4244):

> "Titan Company, Inc. assumes all costs incidental to the filing and prosecution of our foreign applications under this license; pays all necessary maintenance fees during their life; and cannot permit abandonment without our approval. * * *
>
> "* * * Furthermore, the du Pont foreign applications and patents under which Titan Company Inc. will be licensed are of relatively minor importance, and we retain all rights of manufacture and sale for du Pont under our foreign patents without any filing or maintenance costs."

It is apparent, therefore, that whatever the pressure of Jebsen and National Lead, du Pont on its side succeeded in remaining clear of the conspiracy and in determining its own policy by reference to *patent considerations only*, in harmony with the anti-trust laws.

3. *Du Pont's Export Policy Maintained for Valid Business Reasons.* Du Pont adhered to the export policy which it had stated in 1933 it was then pursuing. This course of conduct reflected a number of economic, business and legal factors apart from the obvious fact that general economic conditions, particularly in Europe, during this period were not conducive to foreign trade (R. 1137-1141, Ex. R. 711, 1233, 1535).

Of major importance was the fact that du Pont's energies during this period were necessarily wholly devoted toward meeting United States domestic demands for titanium pigments. In spite of the fact that total production in this country increased more than tenfold from 1933 to 1944, this proved no more than necessary to meet the demand.

As the District Court found, du Pont "made frequent plant expansions for the manufacture of pure and composite TiO_2" (FF. 78, R. 290). Nonetheless, new uses and outlets for titanium pigments developed. Du Pont throughout the period following 1933 was faced with a continuing problem of constructing capacity sufficient to meet the demands of the United States market. Du Pont operating at full capacity never had surplus capacity available to permit allocation for export to Europe or other foreign countries even assuming that such exports would have been possible (Ex. R. 4397, 4398).

Mr. Daley who was directly responsible for du Pont's titanium pigment production testified "I was in production exclusively at the time and I remember that sales were ahead of capacity or were forecasting that they very soon would be and I was scrambling for a period of eight solid years. That is my vivid recollection" (R. 1163). Detailed charts introduced in evidence for the purpose of illustrating the relationship which existed in du Pont's manufacture between sales and capacity for both pure tianium oxide and composite pigments showed a constantly over-sold condition in spite of persistent and numerous substantial plant expansions (R. 1162, 1163).

Not only was capacity inadequate to provide a firm basis for a development of export sales, but it is significant that the entire European market has always accounted for substantially less production and sales of titanium pigments than the United States alone (R. 967, 968, 1146, 1147, Ex. R. 2623, 3786, 3787, 3814).

Furthermore, even if du Pont had had any export capacity, it would not have regarded Europe as an attractive potential market. European costs were below American

costs (Ex. R. 2024, 822, 1264), and this was recognized to be a most significant factor (Ex. R. 1422). Moreover, to sell titanium pigments in foreign markets, du Pont would have been required to set up a technically trained sales force which would be in constant communication with the customer's particular problems and thoroughly familiar with the needs and requirements of the particular trades served. This was because titanium pigments cannot be sold in neat packages for ready utilization of a wide consumer market. They must be individually sold for special uses and with regard to many technological manufacturing problems (R. 950, 1055, 1155, 1078, Ex. R. 4325, 4360).

Finally, but of major consequence in connection with the whole United States problem, was the consideration which necessarily had to be given to the strongly intrenched position of competitors manufacturing titanium pigments in the foreign markets. These European manufacturers, particularly in Great Britain, had not only the advantage which flowed from high protective tariffs (Ex. R. 2072, 1270, 753, 1230, 758, 766, 822, 3340, R. 949), but they had also many advantages over United States producers because of special arrangements for obtaining sulphuric acid or other raw materials, because of generous support from their respective governments by subsidy or otherwise, and because of the power which they obtained through various cartel arrangements which existed among these European manufacturers.

They also were in a position to assert their patents against du Pont exports. Prior to the cross-license agreement between du Pont and National Lead, for example, the major European manufacturers had obtained patent rights in foreign countries under the very basic and essential Jebsen and Blumenfeld patents (FF 33-34, R. 245-247).

Du Pont was manufacturing titanium pigments in the United States under the American Blumenfeld patents in infringement of the Jebsen United States patents (Ex. R. 1171). It had no rights under the foreign equivalents of these Jebsen or Blumenfeld patents (FF 34, R. 247, Ex. R. 1419). The result of this was that under the laws of all important foreign industrial countries, the principal foreign manufacturers as owners of these foreign patents were in a position to assert the patents as a bar to the importation of products made abroad under the same processes (R. 1143, 798, 801, 805). These laws are summarized in Appendix C.

In the light of the foregoing facts which the record indicates were well known and considered at the time in the industry, it is not surprising that du Pont failed to export; nor is it surprising that the District Judge accordingly refused to find an agreement by du Pont not to export implied from the course of conduct which it pursued—a course of conduct clearly prompted by sound and reasonable business considerations.

4. *The 1941 Amendment to the 1933 Patent Licensing Agreement Retained du Pont's Independence.* National Lead and du Pont amended Exhibit E by a written agreement dated as of January 1, 1941. The amendment changed the substance of the 1933 agreement so as to (1) specifically include extenders within the term "licensed field", (2) defer exchange of patent applications until six months after filing, and (3) eliminate exchange of technical information (Ex. R. 112).

In the Spring of 1940, as heretofore pointed out, du Pont had insisted upon eliminating its exchange of technical

information with National Lead; and the exchange had in fact ceased at that time. Du Pont then suggested that a new agreement be drafted to confirm this (Ex. R. 1929), as well as to take care of other points. In the Fall of 1940 the question of adjusting the 1933 agreement was referred by National Lead to Jebsen, who was then in Paris (Ex. R. 1948). Jebsen indicated very clearly that he preferred that the matter be handled in the form of an amendment rather than a new contract (Ex. R. 1953). He suggested that an amendment could be effected without consulting National Lead's European associates, and that this course of action was justified by the "international situation" (Ex. R. 1955). Jebsen then went on to point out why a more delicate question would be presented if an entirely new contract was drafted, indicating quite clearly his desire to avoid further discussions with I. G. Farbenindustrie and the foreign associates similar to those which had been brought about in 1933 because of the "drastic deviation" of the 1933 agreement from the fundamental "principles of" the 1920 agreement. Jebsen's letter noted in this connection that the raising of these questions anew would certainly be troublesome because "Du Pont will not be in a position to give more consideration than the last time" (Ex. R. 1956).

Whether these views were ever relayed to du Pont, the record does not indicate, but it is a fact that the matter was eventually handled in the form of an amendment (R. 73). There is no evidence that in connection with this amendment du Pont was asked to enter into any understanding or that it did in fact commit itself in any degree beyond the written terms of the instrument.

SPECIFICATION OF ASSIGNED ERRORS TO BE URGED

The following Assignments relate to the entire Part One of the Argument of this brief: I; II; III-(11); V-(2); VI; VII.

The following Assignments relate to the alleged connection between du Pont and the international cartel, and, therefore, are urged under Point I of Part One of this brief: III-(1), (2), (3), (4—except sub (5)), (7), (8), (9), (10); IV except (3) and (8); V-(1).

The following Assignments relate to the 1933 agreement and amended agreement, and to the competitive situation in the American domestic industry, and are, therefore, urged under Point II of Part One: III-sub(5) of (4), (5), (6), and that part of (7) which relates to the construction of the 1933 agreement; IV-(3) and (8).

Assignment II-(3) deals with paragraph 7 of the decree, and, therefore, covers the subject matter of Part Two of this brief, which deals only with the one sentence of paragraph 7 which (we submit) should be eliminated from the decree even if the decision below be affirmed on the merits against du Pont. The sentence in question orders du Pont to supply technical information to licensees.

SUMMARY OF ARGUMENT

The Sherman Act interdicts "every *contract, combination* in the form of trust or otherwise or *conspiracy,* in restraint of trade." Du Pont contends that it neither conspired, combined nor contracted in a manner prohibited by that Act. This point is discussed in Point I of Part One immediately following.

The District Court concluded that du Pont conspired and combined to restrain trade in violation of Section 1 (R. 306), but this conclusion cannot be sustained in view of the specific findings that du Pont made no promise or agreement, express or implied, either to join the cartel conspiracy and combination or to further its purposes and objects.

The District Court's decision is also open to the interpretation that in some manner du Pont combined with National Lead and its foreign associates through conduct which fell short of that from which agreement can be inferred but yet constituted combination. The suggestion that any proper basis exists for distinguishing a conspiracy from a combination under the Act is in itself novel and has not been previously advanced. Proof of combination, like proof of conspiracy, has traditionally been held to require proof of express or implied agreement.

Even if some such lesser conduct may establish participation in a combination under special circumstances, here du Pont followed a wholly reasonable course of conduct. Its actions resulted in no unlawful restraint but rather brought about the development of a competitive titanium pigment business in the United States.

Du Pont made no contract prohibited by the Sherman Act. Its non-exclusive patent cross-licensing agreement of 1933 with National Lead, which was not attacked by the government, was conducive to competition and wholly consistent with the decision of this Court in the *Cracking* case. We discuss below the validity of this agreement which was criticized by the District Court but not held illegal.

If the judgment of the District Court as to du Pont is not reversed on the merits, du Pont submits that there is

one provision of the decree which should be eliminated. That is the provision requiring disclosure of du Pont's existing and future technical information in the field of titanium pigments. The District Court did not have the legal authority to require the compulsory licensing of such technical information, and its order in this regard in any event constituted a serious abuse of discretion. This point can be very shortly argued, and we, therefore, defer it to the end of the brief (Part Two, *infra*, p. 109).

ARGUMENT

PART ONE

THE DECISION BELOW SHOULD BE REVERSED AS TO DU PONT

POINT I

DU PONT DID NOT BECOME A MEMBER OF THE INTERNATIONAL CARTEL

(A)

THE DISTRICT JUDGE FOUND THAT DU PONT DID NOT AGREE TO BECOME A MEMBER OF THE CARTEL. THE ABSENCE OF AGREEMENT IS FATAL AT LAW.

As far as the merits are concerned this appeal presents at the outset a clearly defined issue, namely, whether du Pont may be legally held to have joined the cartel conspiracy in view of the explicit findings that du Pont made no agreement, understanding or promise of any kind, express or implied.

An examination of the District Court's findings relating to du Pont's entry into the cartel conspiracy should be made in the light of the charges originally tendered by the government in its Complaint and the action taken by the Court on the evidence with respect thereto. In brief, the government's case disintegrated as far as du Pont was concerned. It charged du Pont with participation in the cartel conspiracy on the specifically stated theory that du Pont had by oral agreements subscribed to the principles of the Contract of 1920 and otherwise made explicit commitments

of an illegal character to National Lead. When the evidence was in it wholly failed to support the government's charges as to du Pont's participation. Without burdening this brief, we may in short space present by parallel columns below a comparison of the government's theory of the case, on the one hand, with the facts as established to the satisfaction of the District Judge on the other. The District Judge not only refused to find as requested by the government but actually on many crucial points made findings precisely opposite to the government's position; *cf. Hartford-Empire Company* v. *United States*, 323 U. S. 386 (1945), at pp. 403-406.

After the purchase of Commercial Pigments by Krebs in July 1931, du Pont "continued negotiations to reach a world-wide agreement" which would eliminate competition between the National Lead and Blumenfeld groups. (Govt's Proposed Finding 63, R. 104, see also Complaint, par. 53, R. 22).	After the purchase of Commercial Pigments by Krebs in July 1931, du Pont did not authorize participation in the "continued negotiations to reach a world-wide agreement" between the National Lead and Blumenfeld groups. (FF 71, R. 278).
National Lead's patents "were either not valid or could be avoided at a slight additional expense." Both du Pont and National Lead "agreed not to contest the validity of any of their patents." (Govt's Proposed Finding 64, R. 105).	Both du Pont and National Lead "in good faith claimed that each infringed certain of the other's titanium pigment patents and both in good faith denied such infringement claiming, among other things, that the patents alleged to be infringed were of doubtful validity." (FF 72, R. at 279).

Du Pont was willing to subscribe by "an oral understanding" to "the provisions of the Contract of 1920." (Complaint, par. 54; R. 23). By virtue of the 1920 agreement and oral understandings, du Pont "has in fact subscribed to said Contract of 1920." (Complaint, par. 61, R. 27).

For National Lead to license du Pont without the consent of National Lead's foreign associates it was necessary that du Pont "adhere to the principles of the 1920 agreement; such adherence du Pont refused." (Op., R. 214). Du Pont "did not subscribe to the 1920 agreement; the agreement it did sign in 1933, deviated sharply from the form and from the principles of the 1920 agreement." (Op., R. 213).

Rupprecht, on behalf of du Pont, orally agreed with Beschorman of National Lead that du Pont would not "export any titanium compounds outside of the United States except to South and Central America." (Complaint, par. 55, R. 24; see also Govt's Proposed Finding 66, R. 106).

Du Pont did not agree "that it would refrain from exporting titanium pigments * * *." (FF 73, R. at 288).

The 1933 agreement "restricted the sale of titanium pigments by DP to the United States, Central and South America." (Govt's Proposed Finding 67, R. 106-107).

The District Court refused to make this finding.

Du Pont "did not clearly repudiate" any obligation to the Blumenfeld group until after the execution of the 1933 agreement. (Govt's Proposed Finding 64, R. 105-106).

Before 1933 du Pont "disclaimed any obligation" to the Blumenfeld companies. (FF 88, R. 300).

Du Pont "orally agreed with Blumenfeld that it would not export into the territories of the Blumenfeld companies outside of the United States." (Govt's Proposed Finding 66, R. 106; see also Complaint, par. 65, R. 29-30).

Blumenfeld requested du Pont "not to export." Du Pont advised that it "would make no such agreement * * *." (FF 73, R. at 289).

The District Judge, in rejecting the government's contentions, adopted a very novel theory and relied upon a single circumstance which he isolated from other transactions of record in holding that du Pont joined the conspiracy and combination.

The opinion reflects the course of reasoning by which the District Judge reached the conclusion that du Pont should be held a member of the cartel conspiracy. Appendix B to this brief contains a very detailed and lengthy analysis of the District Judge's opinion. In ordinary circumstances we would have refrained from burdening the Court with such material. The situation confronting du Pont in this case, however, is unique. Not only was the opinion submitted before the findings were finally framed, but in the conferences with the District Judge counsel were instructed to assist the Judge to conform the findings to the opinion for the reason that the opinion represented his considered judgment on the merits. Since the District Judge's reasoning in the last analysis presents essentially the application of legal principles which we here contest, a detailed review of the manner in which such principles were applied to the facts will, we believe, help this Court in reaching a determination of du Pont's appeal on the merits.

It will be recalled from the Statement of the Facts (pp. 29 to 39, *supra*) that Rupprecht, du Pont's represen-

tative during the course of negotiation of the 1933 non-exclusive patent cross-licensing agreement, was shown by Beschorman a copy of the National Lead letter of July 12, 1933 to I.G. Farbenindustrie. This occurred before the letter was mailed. The natural question arose, what did Rupprecht say or do under these circumstances. Rupprecht had died by the time of trial and Beschorman was too ill to testify. No one else was present when Beschorman showed Rupprecht the National Lead letter to I.G. Farbenindustrie. Consequently no oral testimony could be presented either by the government or by the defendants bearing on this question. There was also no written memoranda or other documentary evidence produced covering the conversation which must have taken place. The record merely establishes the simple fact that Rupprecht was shown the letter before it was mailed.

The District Judge found on these facts as follows (FF 73, R. at 287-288):

> "There is no evidence that Rupprecht remonstrated against the sending of Beschorman's letter to IG. Krebs and DP through Rupprecht acquiesced in and ratified the assurance made by Beschorman to IG as to territorial delimitations of the titanium pigment business. In acquiescing in such assurance that DP would not manufacture in or sell in TG's territory, DP was not making a promise; it was doing no more than giving expression to its then existing policy not to manufacture or sell in Germany and other TG territory. * * *
>
> "DP did not agree with TP or NL that it would refrain from exporting titanium pigments into TG's territory; but it assured TP and NL that, as a practical matter, such exports would not take place.

> "DP did not agree with TP or NL that it would grant NL's foreign associates exclusive licenses under DP's foreign patents; but it gave assurances that the practical effect of its conduct would produce substantially identical results as if it did so agree."

These findings, which, as the District Judge indicates in his opinion, form the basis for his conclusion after a review of all the evidence that du Pont became a special member of the conspiracy and combination, boil down to a simple statement that du Pont, on the basis of its then existing export policy, assured National Lead that as a practical matter exports would not take place.

There is no doubt as to what the District Court meant by the term "assurance". The word "assurance" had a very definite meaning in the Judge's mind. "Assurance" was chosen deliberately to express his finding that no agreement, express or implied, between du Pont and National Lead or National Lead's foreign associates could be found on the facts. The Judge used the word in its connotation of "a declaration tending to inspire confidence" [18] and not as signifying an obligation or promise. This is made clear by his finding that in acquiescing in such assurance du Pont "was not making a promise; it was doing no more than giving expression to its then existing policy not to manufacture or sell in Germany and other TG territory" (FF 73, R. at 287-288, Op. R. 216). It is not without significance that the government sought again and again in its proposed findings (Govt's Proposed Findings 66, 68, R. 106, 107) and before the Judge in conferences on the Findings to have the word "assurance" changed to agreement

[18] Webster's International Dictionary.

or promise, but he declined.[19] And in order that there could be no doubt as to his position, the Judge expressly found that du Pont did not agree that it would refrain from exporting or that it would give exclusive licenses,—findings which the government has not challenged and by which it must be bound.

The foregoing analysis of the findings demonstrates that the District Judge held that du Pont's mere unilateral statements with respect to its existing business policy were sufficient to hold it had joined the cartel conspiracy or combination.

The issue of law thus presented is therefore:

> Can the anti-trust laws be violated by a statement on the part of one company to a competitor that it is its existing business policy not to sell in some foreign territory when it is admitted that no agreement or commitment of any sort not to change the policy the next day was expressed or can be implied?

Du Pont contends that the District Court erroneously applied the law of conspiracy to the facts as found and the case against du Pont must accordingly be dismissed. To accept the District Court's affirmative answer to this proposition, which was the sole basis upon which the District Court, after reviewing all the evidence, found du Pont to have participated in the cartel, would represent a substantial step in the direction of the civil law doctrine of crime by

[19] That the Judge meant that an agreement did not exist, however informal or from whatever circumstances deduced or inferred is made doubly clear by his refusal to accede to the government's request to amend the findings by inserting the word "formally" or "in writing" in the phrase "du Pont did not agree."

association and a definite departure from long and well established precedent.

From the genesis of the law of conspiracy down to this case the one essential and necessary element of conspiracy has been the *fact* of an agreement, express or implied, between the conspirators. The earliest definition of conspiracy recorded in Anglo-American law, contained in the Third Ordinance of Conspirators which was passed in 1304, is:

> "Conspirators be they that do confeder or bind themselves by Oath, Covenant, or other Alliance, that every of them shall aid and support the Enterprise of each other falsely and maliciously to indict, or cause to be indicted (or falsely to acquit people) or falsely to move or maintain pleas;" etc.[20]

Gradually, by statute and decision, the offense was broadened to embrace other objectives, but the requirement of agreement has never changed. However proved, whether directly or indirectly, and from whatever circumstances the inference was permitted to be drawn, and whether the agreement was formal or informal or express or tacit, the fact of agreement remained a necessary element of the offense.[21]

The essential nature of a conspiracy under the Sherman Act,[22] and under other Federal conspiracy laws,[23] remains the same as it was at common law.

---

[20]See Sayre, *Criminal Conspiracy* (1922) 35 Harv. L. Rev. 393, 396.

[21]Wright, *The Law of Criminal Conspiracies* (London, 1873), p. 69 *et seq.*

This Court has times without number reiterated the proposition that "a conspiracy is constituted by an agreement" that "a conspiracy is a partnership in criminal purpose" [24] and that "the gist of the offense of conspiracy * * * is agreement among conspirators".[25] Occasionally, the term "concert of action" has been used, but always as meaning either action taken together pursuant to agreement or action from which the fact of agreement can be reasonably inferred.[26]

The cases have emphasized again and again the necessity for the government to prove at least collective planning or federating or combining for a criminal purpose. The government must show that the parties worked together understandingly with a single design for the accomplishment of a common unlawful purpose.[27] Whatever the definition of "concert of action", it has not been stretched

to embrace du Pont's wary arm's-length dealings with the combination in this case.[28] Indeed the extension of the law of conspiracy by the courts and the abuse of that law by the prosecuting arm of government has for some time been a matter of grave concern to those interested in the maintenance and development of an equitable system of law according with Anglo-Saxon traditions of justice.[29] We believe that this case presents a clear and dangerous extension of the definition of conspiracy, the seriousness and importance of which transcends this cause and the purely private interests of this appellant and should not be obscured by the fact that this litigation happens to be civil in form. Indeed, a criminal indictment involving precisely the same transactions and allegations is pending against National Lead and du Pont and four individual defendants in the Southern District of New York.

The doctrine that agreement is an essential element in proving conspiracy is so well established and rooted in common law precedents that further discussion would appear unnecessary. Three recent decisions of this Court; namely, *Interstate Circuit, Inc.* v. *United States*, 306 U. S. 208 (1939); *United States* v. *Masonite Corporation*,

[29] *E.g.*, see Recommendations of Senior Circuit Judges, Report of the Attorney General (1925), pp. 5-6. See also *Kotteakos* v. *United States*, 66 S. Ct. 1239 (1946).

316 U. S. 265 (1942); and *Direct Sales Co.* v. *United States*, 319 U. S. 703 (1943) may be urged by the government; but analysis of these decisions shows unequivocally that the fundamental rule has not been changed. The *Direct Sales* case, the most recent in point of time, clearly bears out our position, for there this Court recognized that the fact of agreement is "crucial", underlining this by noting that where agreement must be inferred from the facts or a course of dealing "more than suspicion, more than knowledge, acquiescence, carelessness, indifference (or) lack of concern is necessary". The test was made explicit by the Court's statement that there must be established "informed and interested cooperation, stimulation and instigation" and the parties must join "both mind and hand" to the furtherance of the conspiracy. In the *Interstate Circuit* case the existence of an agreement was inferred, and in the *Masonite* case facts were ample to support a finding of actual unlawful agreement. However, *dicta* from the *Interstate Circuit* case, repeated subsequently in the *Masonite* case, require analysis. The Court, in the *Interstate Circuit* case, said after sustaining the trial court's finding of agreement:

> "* * * agreement for the imposition of the restrictions upon subsequent-run exhibitors was not a prerequisite to an unlawful conspiracy. It was enough that, knowing that concerted action was contemplated and invited, the distributors gave their adherence to the scheme and participated in it. Each distributor was advised that the others were asked to participate; each knew that cooperation was essential to successful operation of the plan. They knew that the plan, if carried out, would result in a restraint of commerce, which, we will presently

point out, was unreasonable within the meaning of the Sherman Act, and knowing it, all participated in the plan. The evidence is persuasive that each distributor early became aware that the others had joined. With that knowledge they renewed the arrangement and carried it into effect for the two successive years.

"It is elementary that an unlawful conspiracy may be and often is formed without simultaneous action or agreement on the part of the conspirators. *Schenck* v. *United States*, 253 F. 212, 213, aff'd, 249 U. S. 47; *Levey* v. *United States*, 92 F. 2d 688, 691. Acceptance by competitors, without previous agreement, of an invitation to participate in a plan, the necessary consequence of which, if carried out, is restraint of interstate commerce, is sufficient to establish an unlawful conspiracy under the Sherman Act. *Eastern States Lumber Assn.* v. *United States*, 234 U. S. 600; *Lawlor* v. *Loewe*, 235 U. S. 522, 534; *American Column Co.* v. *United States*, 257 U. S. 377; *United States* v. *American Linseed Oil Co.*, 262 U. S. 371." (pp. 226-7)

We do not believe it can reasonably be said that the language was intended to overrule the long established precedent. Considering that such language as "gave their adherence to the scheme and participated in it", "participated in the plan", and "acceptance * * * of an invitation to participate in the plan" is used, there can be little doubt but that this Court was simply underscoring the well recognized proposition that agreement can be inferred from a course of conduct or concert of action and that a prior understanding to participate was not necessary. From the participation itself, i.e., the subsequent common sharing with others, the agreement to participate in an unlawful

conspiracy could be inferred. *Eastern States Retail Lumber Dealers' Ass'n.* v. *United States,* 234 U. S. 600 (1914), and other decisions relied on by the Court in the *Interstate* case simply stand for the well established rule that unlawful agreements may be implied from conduct and thus give further support to the view taken here.

The very recent decision of this Court in *American Tobacco Co.* v. *United States,* 66 S. Ct. 1125 (1946), discusses the elements of conspiracy in a Sherman Act proceeding, and again emphasizes the traditional and well established view that a conspiracy must be based upon agreement, express or implied. The Court pointed out that while no formal agreement is necessary, proof of understanding or meeting of the minds is a prerequisite. The Court said (p. 1139):

> "* * * No formal agreement is necessary to constitute an unlawful conspiracy. Often crimes are a matter of inference deduced from the acts of the person accused and done in pursuance of a criminal purpose. Where the conspiracy is proved, as here, from the evidence of the action taken in concert by the parties to it, it is all the more convincing proof of an intent to exercise the power of exclusion acquired through that conspiracy. The essential combination or conspiracy in violation of the Sherman Act may be found in a course of dealings or other circumstances as well as in any exchange of words. United States v. Schrader's Son, 252 U. S. 85, 40 S. Ct. 251, 64 L. Ed. 471. Where the circumstances are such as to warrant a jury in finding that the conspirators had a unity of purpose of a common design and understanding, or a meeting of minds in an unlawful arrangement, the conclusion that a conspiracy is established is justified."

See, also, *Pinkerton* v. *United States*, 66 S. Ct. 1180 (1946).

Unlawful agreement has not been established even by inference here, for the District Judge has sought to tie du Pont to the unlawful undertaking by reliance upon du Pont's mere statement of its established policy, a statement made without even moral commitment to act consistently therewith concerning a policy firmly based on reasonable business considerations. It was urged on the trial that agreement should be inferred from the events in 1933 or that it should be inferred from subsequent conduct, but the Judge rejected these promptings after searching, painstaking study of the facts which adequately explained the action taken or not showing that its conduct was in many respects divergent from the cartel conspiracy pattern, that there were business facts which adequately explained the action taken or not taken by du Pont, that there was no change in du Pont's conduct coincident with the development of its relations with National Lead, and that it had no stake in the venture or motive for furthering the objects of the conspiracy.

(B)

ASSUMING *ARGUENDO* THAT AGREEMENT IS NOT NECESSARY TO VIOLATION OF THE SHERMAN ACT, THEN WHAT DU PONT SAID OR DID MUST BE MEASURED BY THE TEST OF REASONABLENESS. CONFRONTED WITH THE NECESSITY OF OBTAINING A LICENSE UNDER THE CARTEL PATENTS, IT WAS CERTAINLY REASONABLE FOR DU PONT MERELY TO STATE THAT IT WAS NOT ITS THEN BUSINESS POLICY TO SEEK EXPORT TRADE, ACCOMPANIED BY A REFUSAL TO BIND ITSELF FOR THE FUTURE. THIS IS ALL THAT THE JUDGE FOUND THAT DU PONT DID.

This Court will appreciate that this point (B) is an alternative to point (A). If we are right that the absence of agreement is fatal to the government's case under the anti-trust laws, then this point (B) is unnecessary.

We proceed in this point on the assumption that the District Judge was right in determining as a fact that Mr. Rupprecht on behalf of du Pont in 1933, in order to obtain the license under the cartel patents, did state to the cartel that it was not then the policy of du Pont to export to Europe, and further that the Judge was right in his determination of law that a statement by du Pont might bring it within the condemnation of the Sherman Act, even though it made no agreement. It does not follow that this particular statement was enough to bring du Pont within the condemnation of the Act.

We submit that the Judge committed error of law in not examining the question whether the statement in itself was a *reasonable* thing for du Pont to do, as a condition to obtaining the license and entering into competition with the cartel. And we submit further that it is so obviously

reasonable that the Judge could not as a matter of discretion hold to the contrary.

In plain words, we submit that it is all out of proportion to give a decision against an American company under the anti-trust laws when admittedly all that it has done is to have succeeded (14 years ago) in obtaining a license under the cartelized patents and thereby developing a competitive industry in the United States, and in doing so at the very low and ultra-reasonable price of making a completely informal statement that it was then its policy not to export abroad, while at the same time refusing to make any commitment or agreement that it would continue to be its policy not to export.

As du Pont's conduct was wholly reasonable, and indeed even beneficial to American trade and commerce, it comes squarely within the general philosophy underlying the decisions of this Court in enunciating and establishing the "Rule of Reason". Indeed, those cases govern this case *a fortiori*, for they were cases of actual restrictive agreements. If agreements in and of themselves restrictive may be held nonetheless lawful, certainly independent conduct from which no agreement can be implied can equally be tested by concepts of reasonableness.

In referring to the rule of reason, we wish to emphasize that we are not advancing the argument which was made below by National Lead, to the effect that cartel agreements may nonetheless be found consistent with the Sherman Act where the restraints were reasonable, nor are we referring to the type of argument which might be made by Zirconium under the rule of reason doctrine to the effect that it had been forced to accept illegal restraints. Du Pont neither agreed to, nor was forced to accept, restraints.

Du Pont had the strongest type of reasonable justification for anything it did in 1933, in that otherwise it could not have then entered the titanium field on a competitive basis at all. The du Pont argument and the Judge's response to it are set out in the opinion itself (R. 218-219):

> "At this point, DP advances the argument that it had no choice but to do business with the cartel unless it was content to stay out of the titanium field. To put it in the words of DP's counsel,
>
> > 'We respectfully submit in conclusion that it cannot be the law of the United States that it is the function of the Courts themselves to impose that form of restraint of competition which must resist from a ruling that whenever a European company has a monopoly in its own country (and practically all of them do), and then has a relation in the nature of a common enterprise with some American company, it becomes the duty of all other American companies to renounce and forego access to the inventions and developments controlled by those foreign companies, and to leave them as the exclusive property of its American competitor, the partner of those foreign companies'.
>
> "Perhaps, the answer is that DP, having discovered the conspiracy, should have asked the Attorney General to break it up. Confessedly, the chances of DP getting NL's patents and know-how after such a hostile act would be, to say the least, dubious. But in any event the courts may not validate unlawful conduct because in a particular instance there may be social losses involved in enforcing the law. The paradox which DP discovers, even if it were a genuine one, would be of interest to Congress, not to the courts. But the paradox

> is not genuine. The conflict is a specious one. Judicial intervention to break up a combination in restraint of trade is not in itself a restraint of trade, although for a time the established channels of commerce may be disarranged. To prohibit adherence to conspiratorial trade restraints hampers trade in about the same way that the prohibition against the circulation of counterfeit money hampers it. It may prevent the consummation of a particular transaction but in the long run it frees business from private regimentation and secures it against those who would trammel it."

It will be apparent that the Judge was not here disputing the validity of the facts upon which the du Pont submission was based. He accepted the facts, but differed with the conclusion of law. The effect of the Judge's holding was:

> Whenever a European company has a monopoly in its own country (and practically all of them do), and then has a relation in the nature of a common enterprise with some American company, it becomes the duty of all other American companies to renounce and forego access to the inventions and developments controlled by those foreign companies, and to leave them as the exclusive property of their American competitor who is the partner of those foreign companies, notwithstanding that there may be social losses involved, and even although for a time the established channels of commerce may be disarranged. American competitive trade must await judicial intervention at suit by the Attorney General to break the cartel up even though the American company might be able in the meantime to wheedle patents from the cartel without subscribing to its principles

Would anything be more unrealistic, or more satisfying to international cartelists, than this doctrine that potential competitors must leave them alone in their cartel until the lengthy judicial process under the anti-trust laws has run its course?

We do not exaggerate. The scheme of the cartel in this case was to effect its purposes by cornering patents and technical information. To compete effectively with the cartel it was necessary to have licenses under its patents and technical information during the initial stages of the art. Unless a concern was willing to subject itself to infringement action or to accept a limited role in the industry by proceeding with the manufacture of certain types of titanium pigments which could be made, albeit uneconomically, independent of the cartel patents, it was impossible to launch an independent competitive enterprise in this field without making arrangements with the cartel to obtain access to its patents and technical information.

The Judge's conception that admitted "social losses" must be incurred arose from a failure to observe that the rule of reason as applied to restraint of trade means that that term is so to be construed as to avoid the "social losses" involved in an arbitrary construction. The rule of reason is to avoid social loss, not to compel it.

In arguing to the contrary, the Judge sought an analogy. He said that the hampering of trade that would have resulted if du Pont had renounced the license and access to the technical information would have operated

> "in about the same way that the prohibition against the circulation of counterfeit money hampers it".

In other words, his conception was that to trade with a violator of the anti-trust laws is in the same class as to

circulate counterfeit money. This is fundamental error. The question of what is a restraint of trade is a question of what is or is not really burdensome or beneficial to trade. It is a comparative question. Counterfeiting of money is an absolute felony. There is no such thing as reasonably counterfeiting money.

From the famous *Standard Oil* and *Tobacco* cases down to today, whatever the differing views of members of this Court as to the degree of latitude in the conduct of trade, it has invariably held that, except for a limited class of well recognized, so-called *per se* violations, questions under the anti-trust laws must be determined in the light of an inquiry as to the actual circumstances of the particular case, the ultimate inquiry being as to whether the conduct was reasonable under all of those circumstances. This is not the sort of rule that applies to counterfeiting money.

The case as to du Pont presents the question as to what rule is to apply to the conduct of a party *when confronted with the power of a cartel and in competition with that power.*

These were the essential features of the problem before du Pont prior to its contract with National Lead:

Du Pont was engaged in the manufacture of lithopone and other ingredients for the production of white paint and related products. A new product (titanium pigments) had, however, been developed over the preceding decade to a point at which it had been apparent that it would be more efficient and more economical than lithopone or any of the older products. It had acquired from Commercial Pigments a titanium pigment operation which its Legal Department had concluded infringed both National Lead

and Titan, Inc.'s patents. Certain necessary and dominating patents covering titanium pigments and its manufacture, and the principal reservoir of technical information in regard to the new art, resided in a world cartel, carefully erected on the basis of deliberately restrictive contracts dividing production and markets.

The cartel embraced the great I. G. Farbenindustrie in Germany, all of the principal chemical manufacturers in Great Britain, and National Lead in the United States, and was bound in Europe by cooperative and pooling agreements with the companies [the Blumenfeld group], notably in France, Italy and Czechoslovakia, which had rights under the second most important group of patents. Du Pont had purchased the company in the United States which had rights in the United States only to the use of this second group of patents, but it had no rights under the cartel's patents and no knowledge of its technical processes.

Du Pont and National Lead each "in good faith claimed" that the other infringed its patents (FF 72, R. at 279); and du Pont was accordingly "manifestly eager to obtain access to National Lead's patents and skill" (R. 213). The record amply supports these findings, as it contains voluminous intra-company correspondence both from the National Lead and the du Pont files as to the number of existing patents, particularly of the large number and strength of those owned or controlled by National Lead, and also of the importance of the technical information, particularly that in the possession of National Lead.

It was not seriously open to du Pont to contest National Lead's patents. At that time the decisions of this Court and of the Third Circuit Court of Appeals, of which circuit du Pont was an inhabitant, were strongly favoring patents.

This was before the recent radical change in the attitude of the Federal Courts towards patents. Circuit Judge Evans (of the Seventh Circuit) has made an interesting study (Journal of the Patent Office Society, April, 1944, Vol. XXVI, No. 4, p. 233, particularly the chart at pp. 254-255) from which it appears, for example, that in the Third Circuit there has been a remarkable change. thus reflected:

	Decisions during 12-month period 1935-6 (37 cases)	1942-3 (28 cases)
Patents held valid and infringed.....	Over 50%	Well under 10%
Patents held invalid	Under 35%	About 75%

In short, even several years after the time of the patent controversy between National Lead and du Pont, the fear of infringing a patent had substantial justification.

Business and economic realities prevented du Pont from undertaking deliberate infringement of a patent structure such as was then controlled by National Lead.

The recognition by the courts of the importance of patents had also been strengthened and clarified, so far as the anti-trust laws were concerned, by the then recent decision of this Court in the *Cracking* case, *Standard Oil Co. (Indiana)* v. *United States*, 283 U. S. 163 (1931), deciding that in cases of *bona fide* patent conflict (such as the Judge expressly held this case to be) cross-licensing agreements, even between major companies already established in the particular industry, are not illegal. The *Cracking* case governed the titanium situation *a fortiori* because du Pont was not yet really established in the titanium industry. And the Judge expressly found in this case that

the 1933 contract was carefully drafted in the light of this Court's decision in the *Cracking* case (R. 214).

What were the economic conditions prevailing at the time? Europe was, at least temporarily (and, of course, it later proved that it was permanently), closed as a practical matter to American exports of this character. In Great Britain the value of the pound sterling had been reduced by governmental action by 40%, and exports of American products (except in the case of necessities meeting no British competition) had been rendered impossible. In Germany, Hitler had come into power, and although the future was not foreseen, it was universally recognized that his policy would at least be strongly nationalist and would support German industry.

The United States was in the very depths of economic depression and on the threshold of that period of governmentally favored cooperation within industry which was principally embodied in NRA. There was ample scope and need for development of capacity by du Pont to supply the domestic market, if only it could obtain a license so as to be free of infringement of National Lead's patents.

At this point, and against this background, National Lead told du Pont that before it could sign the cross-license agreement it must overcome the insistence of the I. G. Farbenindustrie in Germany that du Pont agree to the cartel principles,—division of territory, restriction on customers, etc. Du Pont undertook to obtain the cartel controlled patents of National Lead and thus achieve a position where it could compete commercially in both the fields of pure and composite titanium pigments. It resolutely refused to join the cartel, yet urged upon National Lead that National Lead should in turn do "a selling job" on its foreign asso-

ciates of such a character as to wheedle or cajole out of them the consent that they were refusing to give. To accomplish this, in turn, there were two alternatives open to du Pont. It might have given a promise, with its tongue in its cheek, intending to break it. But this it did not do and refused to do because it recognized and stated that such conduct would violate the Sherman Act (FF 73, R. at 287-289). All that was left for it to do was to try to reach the result by making the statement of a simple fact: "It is not at this moment our policy to engage in export trade". If the Germans would swallow that statement of fact, unaccompanied by any promise for the future, National Lead could give the license, and du Pont could successfully compete in the business.

Du Pont succeeded in avoiding any territorial commitments. What really accomplished it was that National Lead in turn was realizing that du Pont might be the source of important inventions and technical improvements, and was anxious to obtain licenses under those inventions (even if they had to be non-exclusive) and knowledge of that information. National Lead, therefore, undertook to do the selling job on the Germans and succeeded.

Du Pont's conduct was not such as to create any restraint prohibited by the Sherman Act. The District Judge placed undue emphasis upon the solidifying of du Pont's export policy which he apparently felt resulted from its continued reiteration. He overlooked the beneficial effect of du Pont's conduct upon titanium pigment competition in the United States, the reasonableness of du Pont's actions and the numerous business factors which made du Pont's adherence to its independent export policy desirable (see pp. 43 to 46, *supra*).

Du Pont accomplished what no other company entering the titanium field in the entire world was able to accomplish, viz. to obtain a non-exclusive license under the patent rights of a member of the cartel and have access to its technical information, without subscribing to restrictive agreements to which the rules of the cartel required it to subscribe. In other words, du Pont created in this country what did not exist in any other country in the world, and what did not exist in this country until du Pont succeeded in creating it—a competitive situation in the industry. Under the special facts of this case, we submit, the question that the Judge should have posed for himself under the rule of reason was this:

> Measuring the advantage to du Pont and to U. S. consumers of its obtaining immunity from suit under the patents of National Lead and access to the technical information of National Lead, upon the basis of which it might enter into competition with National Lead, *was it reasonable* for du Pont as a price therefor to state (but simultaneously to refuse to commit itself as to the future) to National Lead its then existing business policy not to manufacture or sell in Germany and other Titangesellschaft territory?

We respectfully submit that the answer to this question ought to have been unequivocally: "Yes".

We say with confidence that there has never been a case in which it has been held unreasonable for a defendant to give such an expression as to his existing trading intention, when that statement was necessary to obtain a license, and certainly not where the license was non-exclusive, and above all not where the license was necessary to create a

new competitive industry. All of the prior decisions under the rule of reason involve not mere statements of fact but actual promises by the party in question to restrict his own activities. Ours is a case in which the Judge found that the party in question refused to make any promise or agreement. Ours is thus an extreme case in favor of the defendant.

The cases have arisen only where the statement of intention amounted under all of the circumstances of the case to a promise and agreement; but that in itself has not constituted illegality. What the Court has had to go on to decide in each case, has been whether the promise and agreement was nonetheless a reasonable one, all circumstances considered. Here we do not even reach the question, for the trial court has found as a fact that no promise was given and that the statement was "no more than" a statement.

The governing rule of interpretation was really made necessary by the nature of the statute to be interpreted, which was itself the governing law of American trade and commerce. That rule was essentially the rule of the public welfare, or as it has sometimes been called, the rule of reason.

Circuit Judge, later Chief Justice, Taft in *United States* v. *Addyston Pipe & Steel Company*, 85 Fed. 271 (1898) (with the concurrence of Justice Harlan and Judge, later Justice, Lurton), in his classic opinion summarizing the status of the law of restraint of trade at common law as it was brought into the Sherman Act by the use of the word "restraint", explained that promises and agreements which were themselves restraints of trade might be defended in cases in which they were given as ancillary to

a larger contract, provided that they were necessary to the obtaining of the contract.[80]

As late as May 1940, *after* du Pont had entirely terminated even the exchange of technical information, Mr. Justice Stone was repeating and reaffirming the principles of the *Addyston* case, *Apex Hosiery Co.* v. *Leader*, 310 U. S. 469, 498 (1940). The dissent in that case threw no doubt on the validity of Mr. Justice Stone's review of that branch of the law. His review of the common law, of its adoption by this Court as governing the Sherman Act, of its application in the *Standard Oil* and *Tobacco* and numerous other cases, will be found in 310 U. S. at 494-501. He first pointed out that the phrase "restraint of trade * * * had a well understood meaning at common law" (494-5); then that:

> "A second significant circumstance is that this Court has never applied the Sherman Act in any case, whether or not involving labor organizations or activities, unless the Court was of opinion that there was some form of restraint upon commercial competition in the marketing of goods or services * * *" (495);

he then defined the restraints which were typically illegal *per se*:

---

[80]No one has suggested that the principles of the *Addyston* case are no longer law. It certainly was not a decision of judges predisposed against the government in anti-trust cases. Throughout his distinguished career on the bench of this Court, the one branch of the law upon which Chief Justice Taft was most firm, even to the point of dissents from various decisions in favor of defendants, was the law of restraint of trade. And Mr. Justice Harlan's similar firmness in upholding the laws against restraint of trade was signally evidenced by his lone dissent from the discussion by Chief Justice White in the *Standard Oil* and *Tobacco* cases, 221 U. S. 1, 82, and 106, 189 (1911).

> "They were contracts for the restriction or suppression of competition in the market, agreements to fix prices, divide marketing territories, apportion customers, restrict production and the like practices, which tend to raise prices or otherwise take from buyers or consumers the advantages which accrue to them from free competition in the market" (497);

then reviewed the *Addyston* case (498) and the *Standard Oil* and *Tobacco* cases (499-500), obviously reaffirming their holdings; then summarized the position:

> "In the cases considered by this Court since the *Standard Oil* case in 1911 some form of restraint of commercial competition has been the *sine qua non* to the condemnation of contracts, combinations or conspiracies under the Sherman Act, and in general restraints upon competition have been condemned only when their purpose or effect was to raise or fix the market price. * * * Restraints on competition or on the course of trade in the merchandising of articles moving in interstate commerce is not enough, unless the restraint is shown to have or is intended to have an effect upon prices in the market or otherwise to deprive purchasers or consumers of the advantages which they derive from free competition" (500-1).

It may be helpful if we very briefly review a few of the intervening cases that marked the steady path of this Court from its affirmance of the decision of Judge Taft in the *Addyston* case, 175 U. S. 211, down to its decision in the *Apex* case, 310 U. S. 469.

Chief Justice White made the classic expositions of the subject in the *Standard Oil* and *Tobacco* cases, 221 U. S. 1 and 106 (1911). Perhaps the nub of his analysis is in the following, at p. 180:

> "* * * the duty to interpret which inevitably arose from the general character of the term restraint of trade required that the words restraint of trade should be given a meaning which would not destroy the individual right to contract and render difficult if not impossible any movement of trade in the channels of interstate commerce—the free movement of which it was the purpose of the statute to protect".

In our case the individual right to contract was used for the limited and praiseworthy purpose of obtaining non-exclusive rights to enable the contractor actually to increase competition and thereby to increase the free movement of trade which it was the purpose of the statute to protect. Had du Pont refrained from entering into the agreement, the statute would have at least had the effect of rendering difficult, and it would very likely have rendered impossible, the competition which du Pont has developed.

A few years later the duty fell upon Mr. Justice Holmes of restating the rule on behalf of this Court, and he did so in language that has since been frequently quoted.[31] *Nash* v. *United States*, 229 U. S. 373, 376 (1913):

> "Those cases [*Standard Oil and Tobacco*] may be taken to have established that only such contracts and combinations are within the Act as, by reason of intent or the inherent nature of the contemplated acts, prejudice the public interests by unduly restricting competition or unduly obstructing the course of trade".

---

[31] For example, in the *Apex Hosiery* case, 310 U. S. 469, at 501, footnote 22, Mr. Justice Stone re-quoted this phrase from Chief Justice Hughes' earlier quotation of it in *Appalachian Coals* v. *United States*, 288 U. S. 344, 360 (1933).

It will be observed how fundamental was the learned District Judge's error in supposing that this law is not concerned with whether its enforcement causes "social losses". The essential question is whether there is "prejudice" to "the public interests". The measure is not an absolute one, but a comparative one—whether what has occurred has been "undue". There is no such thing as "unduly" counterfeiting money.

The turn of Mr. Justice Brandeis to reassert the rule of reason on behalf of this Court came in *Chicago Board of Trade* v. *United States*, 246 U. S. 231 (1918), reversing the decision below in favor of the government. This was an extreme case, as the Chicago Board of Trade actually agreed upon limited hours of business and upon the price that should govern between sessions. Mr. Justice Brandeis explained at 238:

> "Every agreement concerning trade, every regulation of trade, restrains. To bind, to restrain, is of their very essence. The true test of legality is whether the restraint imposed is such as merely regulates and perhaps thereby promotes competition or whether it is such as may suppress or even destroy competition. To determine that question the court must ordinarily consider the facts peculiar to the business to which the restraint is applied; its condition before and after the restraint was imposed; the nature of the restraint and its effect, actual or probable. The history of the restraint, the evil believed to exist, the reason for adopting the particular remedy, the purpose or end sought to be attained, are all relevant facts. This is not because a good intention will save an otherwise objectionable regulation or the reverse; but because knowledge of intent may help the court to interpret facts and to predict consequences."

Another strong case was before this Court in *National Association of Window Glass Manufacturers* v. *United States*, 263 U. S. 403 (1923). The handblown window glass manufacturers and the trades union had actually agreed upon limited periods of work, thus restraining themselves in a vital respect in order to meet the competition of the machineblown manufactures. A scale of wages was issued to one group of factories from September to January and to a second group from January to June, with the intent and necessary effect of shutting down the first group from January to September and the second group from June to January. It is not surprising that the lower court found the scheme inherently illegal. Once again, however, the Supreme Court had to point out that this missed the significance of the rule of reason. Mr. Justice Holmes was again the spokesman for the Court, in explaining that:

> "To determine its legality requires a consideration of the particular facts. *Board of Trade of Chicago* v. *United States*, 246 U. S. 231, 238" (411-12).

The first occasion for Mr. Justice Stone to be the spokesman for this Court in support of this principle followed in the *Maple Flooring* and *Cement Manufacturers* cases, 268 U. S. 563 and 588 (1925). In the *Cement* case it was once again necessary to reverse the decision below which had been favorable to the government. The specific facts in both cases involved agreements between a combination of manufacturers to exchange among themselves and discuss information as to current conditions in the industry. The cases were on their facts somewhat different from our case,—and indeed the whole point of the law is that each case is to be separately considered on its specific facts; but there are certain respects in which both the *Maple Flooring* and *Cement*

cases were peculiarly like ours in their emphasis upon the fact that "even combinations of persons or corporations" may exchange and even discuss as among themselves information and statistics, provided that they are not thereby "reaching or attempting to reach any agreement or any concerted action with respect to prices or production or restraining competition" (*Maple Flooring* case at 586), and indeed that such activities are legal "even though it be assumed that the result of the gathering and reporting of such information tends to bring about uniformity in price" (*Cement* case at 604).

Chief Justice Hughes was the spokesman for the Court in another case strongly favorable to the government, yet in which the decision below in favor of the government was reversed for similar reasons, *Appalachian Coals* v. *United States, supra.* A combination of bituminous coal operators there went even further than the handblown window glass manufacturers had gone. Although they controlled 73% of the commercial production in their immediate region, they organized and sold through an exclusive common selling agency. Their defense was that they did this in order to defend themselves against adverse economic conditions in a buyer's market. The court below, once again failing to observe that the problem was to inquire into the particular economic facts, condemned the combination. This required Chief Justice Hughes again to review the principles of the rule of reason, quoting from Mr. Justice Holmes' opinion in the *Nash* case and from Mr. Justice Brandeis' opinion in the *Chicago Board of Trade* case, and also citing the *Standard Oil, Tobacco, Window Glass* and *Maple Flooring* cases, as well as the *Cracking* case. The Court said, at p. 377:

"The Anti-Trust Act aims at substance. Nothing in theory or experience indicates that the selection of a common selling agency to represent a number of producers should be deemed to be more abnormal than the formation of a huge corporation bringing various independent units into one ownership. Either may be prompted by business exigencies, and the statute gives to neither a special privilege. The question in either case is whether there is an unreasonable restraint of trade or an attempt to monopolize. If there is, the combination cannot escape because it has chosen corporate form; and, if there is not, it is not to be condemned because of the absence of corporate integration. As we stated at the outset, the question under the Act is not simply whether the parties have restrained competition between themselves but as to the nature and effect of that restraint."

We have now reviewed a series of cases in this Court, with opinions written by four successive Chief Justices (White, Taft, Hughes and Stone), and by Justices Holmes and Brandeis, all united in propounding and explaining the rule of reason. Again and again we have seen the District Courts fall into the error of assuming that, because agreements and combinations restricted the full and secret competitive efforts of members they must inherently be illegal. What this Court has consistently laid down is that, except in cases where the agreement is directed by intent or necessary effect to the fixing of prices or division of market or the like, every such agreement must be studied independently to see whether it was not founded on some valid economic reason. Even agreements by 73% of an industry to eliminate competition and sale by use of a common selling agency (*Appalachian Coals*), or by an entire industry

to limit seasons of production (*National Window Glass Manufacturers*), or by 100% of the traders in a given line of commerce to restrict hours of trade and actually fix prices for limited periods (*Chicago Board of Trade*), have been upheld when the Court found that they were adopted for reasonable ends and therefore did not unduly restrain trade.

We do not need to ask this Court to go anywhere near that far in this case. Du Pont made no restrictive agreement with National Lead of any sort. The patent license agreement was the only *agreement* that it did make and it was admittedly helpful to competition and to trade. The only wrong charged to it is that, in order to obtain the benefits of that agreement, it did "no more than" state that it had no present intention of attempting to enter a foreign market from which it was in any event barred by practical economic reasons.

We respectfully submit that, however considered and from every viewpoint, this conduct of du Pont was entirely innocent under the decisions of this Court, and far from meriting blame or condemnation, it should have received the strong approbation and endorsement of the District Court for having forced competition into an industry which prior thereto had been a closed monopoly.

POINT II

THE 1933 PATENT LICENSING AGREEMENT WAS DESIGNED TO AND DID PROMOTE RATHER THAN RESTRAIN COMPETITION AND TRADE.

The government did not charge either in its complaint or at the trial that the 1933 agreement constituted on its face a violation of the anti-trust laws. And the District

Court did not expressly pass on the validity from the anti-trust standpoint of the 1933 agreement standing alone. The opinion below, however, states that "The case also presents the question whether the contract between NL and DP is offensive to the anti-trust laws independently of the relation of that contract and the parties thereto to the foreign producers" (R. 219). Thereafter the opinion criticizes seriously the character of the agreement independently of conspiracy considerations. Consequently we must examine the validity of the 1933 agreement apart from any such considerations.

The purpose and effect of the agreement must be reviewed in the light of the facts which led to and inexorably demanded its execution.

When it became evident that du Pont, to protect its competitive position, in the pigment industry, must enter the titanium business (Ex. R. 986-7, 1049), it considered the various possible alternatives. At the outset it recognized that it was a late-comer in the field and that the art was already well developed and protected by patents. Nevertheless, it first attempted to solve the problem by its own laboratory and research work, to which was devoted considerable time and money to develop a patent-free process. During the period 1929 to February, 1931, it expended $130,000 (Ex. R. 986, 1050-1). This effort, as found by the District Court (FF 70, R. 278), failed; and by 1931 it had become apparent that before du Pont could enter the business via this route it would be necessary to make substantial additional expenditures to construct and operate a pilot plant, and to undertake very large research and development expenses in addition to large capital expenditures for the construction of a plant, which in any event probably

would not be completed until 1933 (FF 70, R. 278; Ex. R. 986-7, 1051). This was not an attractive prospect. Not only was it recognized that the existing manufacturers were lowering costs and substantially increasing plant capacity, with the result that opportunities for a newcomer in the field would be definitely more unfavorable by the end of 1933, but in view of the known strong patent position of the two existing United States manufacturers of titanium pigments, National Lead and Commercial Pigments, du Pont had no assurance that it could establish an independent patent-free process (Ex. R. 1051-2).

A second alternative was to remain in the pigment industry solely by the production and sale of lithopone, in which it was presently engaged but the commercial doom of which was clearly indicated. That being clearly unacceptable, it could have endeavored to compete in the pigment field by obtaining its titanium pigments from the existing producers, a solution hardly more acceptable than the first, since it would undoubtedly have been at a heavy commercial disadvantage to the pigment producers who could produce their own. Therefore, the only practical courses left to it were either to attempt to buy out one of the existing producers or in some other way to come to terms with them by way of securing a license or otherwise.

Du Pont, therefore, concluded that the best means of entering the business on a basis which would offer adequate prospects of commercial success would be to acquire, if possible, the patent rights and going business of Commercial Pigments (FF 70, R. 278),[32] and, in the event that this

[32]Commercial Pigments was operating under the Blumenfeld process and patents, the only known commercial process other than that operated by National Lead (FF 34-5, 37, R. 247-9).

could not be done, to discontinue research for developing an independent process and be content to purchase pigments from other manufacturers, and to abandon all prospects of entering the field (Ex. R. 1051).

As has been seen, the acquisition of Commercial Pigments proved to be possible and was made. However, this acquisition, although it brought with it capital facilities and important patent rights, by no means proved to be the answer to du Pont's hope for a process free of the patents of others.

At the time of the acquisition du Pont recognized that the Commercial Pigments process infringed a number of National Lead's patents, some of which it believed to be unquestionably valid and some of which it believed, with varying degrees of conviction, to be invalid. Despite this, however, the acquisition was made, in part for the commercial advantages which immediate entrance into a going business offered, and in part because du Pont hoped that, in possession of the patent rights and technical knowledge of Commercial Pigments, in combination with its own, it could successfully find a way to avoid those patents of National Lead which even then it knew covered important steps of Commercial Pigments' operations, or, alternatively, to have a good trading position to obtain rights under National Lead's patents in the event that its efforts to avoid them proved to be unsuccessful; vulnerable to National Lead's patents as it still might be, it would be in a vastly better position than before (Ex. R. 995, 1024-6, 1052, 1089-97, 1150-1, 1172-89).

However, the relatively optimistic spirit in which this avenue was approached was subdued by actual commercial experience in the business which taught it the strength of the National Lead patent position. Not only did it not dis-

cover an economic and commercially competitive way to avoid National Lead's patents,[33] but, almost as important, neither it nor Commercial Pigments had any experience or a substantial patent position in the production of composite titanium pigments, a closely related field in which as a commercial matter it was necessary that it engage. National Lead alone in the United States was engaged in that field and had a blocking patent position (Ex. R. 1242-50, 1040).

In the exploration and resolution of this patent controversy, found by the District Court to be *bona fide* (FF 72, R. 279), du Pont found itself confronted with infringement claims by National Lead not only of the patents which it itself had previously feared, but of a considerable number of other patents (Ex. R. 1297, 1395, 1397-9, 1404). Furthermore, it became apparent that each had patent applications which, if they issued into patents, would be necessary to either the present or proposed operations of the other (Ex. R. 1295-1332, 1353, 1364, R. 891-2). In short, du Pont found itself faced with an irreconcilable and serious patent conflict with National Lead, both existing and potential, the favorable outcome of which would have been expensive, time-consuming and doubtful at best.[34]

---

[33]For instance, certain of du Pont's technical men had, prior to the acquisition of Commercial Pigments, thought it possible to avoid certain National Lead patents at an estimated cost of $20 per ton. However, actual commercial experience, in contrast to its former laboratory experience only, made it clear to du Pont that it would cost $40 a ton to avoid just one of National Lead's patents (Ex. R. 1353). This single cost differential would have amounted to more than 11% of the then selling price of titanium (Ex. 42, not printed but a part of the record on file with the Clerk of this Court).

[34]Similarly, from the National Lead standpoint, National Lead found itself confronted with a number of claims of infringement of du Pont's patents in the operation of National Lead's existing

The resolution of the patent controversy represented by the agreement of 1933 resulted, as it was intended to do and as the District Court found (FF 79, R. 293), in the settling of the existing and potential patent disputes of the parties and the promotion of the more rapid development of the titanium business and a greater freedom of action for the parties under the titanium pigment patents and developments. Among other things, it enabled du Pont, which had never been engaged in the manufacture of composite titanium pigments, to enter this field and to offer substantial competition to National Lead, which had hitherto been the sole producer in the United States (Ex. R. 4361-96), and its effect on du Pont's production of pure TiO_2 was immediate and marked, as is shown on the table presented on page 12, *supra*.

The District Court further found that du Pont had the following purposes in entering into the agreement: (1) to avoid the expense and risks of patent litigation; (2) to avoid research expense in trying to avoid infringement of valid patents of National Lead; and (3) to obtain access to National Lead's technical experience and patents (R. at 292).[35]

Du Pont could, of course, have elected to fight the matter out in the courts if need be, at whatever cost, delay or

---

process (Ex. R. 1309, 1313-4). Further, despite its blocking patent position, National Lead wished to adopt (and subsequently did so) a number of du Pont's operations which were protected by patents, *e.g.*, seeding hydrolysis, salt calcination and other procedures (Ex. R. 1364, R. 911).

[35]The District Court also found that an additional purpose of du Pont in entering the agreement was to strengthen its patent position to the exclusion of others. This finding, which we believe to be without any support in the record, will be examined at length below (see pp. 98-99, 176-179).

risk. But du Pont itself had little faith in the favorable outcome of such a struggle, and the legal and commercial risks were critical and incalculable. These risks it was not, and could not reasonably have been, required by law to undertake. The courts, including this Court, have long and consistently recognized that the anti-trust laws do not demand that patent conflicts be resolved only by litigation, but, indeed, that public policy sanctions and encourages their composition in good faith.[36] Du Pont chose the reasonable course of negotiating a license.

The licensing arrangement which the parties entered into, a simple non-exclusive exchange of rights, was the least restrictive arrangement possible. Indeed, it may fairly be said that there was no restriction in it, either with respect to the activities of the parties or the activities of others. Neither party was prohibited, either by covenant or by the withholding of patent rights, from engaging in any portion of the titanium field. Each was entirely free to license third parties under its own patents, it to be the sole judge of the persons to whom, the time when, the duration, and other terms and conditions, including royalty terms, on which such a license should be granted. There

S. 70 (1902); *United States* v. *Aluminum Co. of America*, 44 F. Supp. 97 (S. D. N. Y. 1941), rev. on other grounds, 148 F. (2d) 416 (C. C. A. 2d, 1945); *cf. United States* v. *United Shoe Machinery Company of New Jersey*, 247 U. S. 32 (1918); *United States* v. *Winslow*, 227 U. S. 202 (1913); *Indiana Mfg. Co.* v. *J. I. Case Threshing Mach. Co.*, 154 Fed. 365 (C. C. A. 7th, 1907), dis'm. per stip., 207 U. S. 603 (1907); *Massie* v. *The Asbestos Brake Company*, 95 N. J. Eq. 298, 123 Atl. 155 (1923).

was no provision for cooperation either in or out of the Patent Office for the securing or defense of patents. Nor was there any provision for action, either jointly or individually, against competitors, whether infringers of the patents of either of them or not. And there were no provisions binding either of the parties to recognize the validity of the patents of the other. The exchange of technical information provided by the agreement was likewise on a non-exclusive basis and without restriction as to the use of the information exchanged.

What the cross-license accomplished was simply liberty of action on the part of both parties freely to engage in the titanium field without hindrance by the other. Far from restricting the activities of either, the agreement promoted competition by enabling the parties more effectively to compete with each other and by permitting the parties to do that which they could not theretofore lawfully and safely do: operate under the patents of each other and compete in full measure with each other.

In short, the agreement diminished the individual lawful patent monopoly powers of each and added no new powers to either to restrict the activities of others. Such power to restrict the activities of others as each continued to have was only that which it had before the agreement, i.e., the exclusive right lawfully given to it by valid patent grants of the United States Government, an individual power both before and after the agreement and one which was neither impaired nor enhanced by the agreement.[37]

---

[37]When the District Court in its opinion (R. 222) states that "the power to prevent it [the development of competition] must be shorn from those who, by combination, have acquired it", it surely cannot be referring to any such power acquired by du Pont in combination with National Lead by means of cross-

This is not the *Hartford-Empire* case,[38] in which the parties allocated fields not only as between themselves but among their respective licensees, cooperated both in and out of the Patent Office and courts to secure and enforce patents which should not have been issued, to juggle claims as between themselves, to prevent third parties from securing patents, and by patent infringement suits and otherwise to drive competitors either out of business or into channels predetermined by them, and in which the parties exercised a veto over the licensing of third parties and bought up rivals and competitive patents. This is not the *Bathtub* case,[39] or the *New Departure* case,[40] in which competitors used patent licenses as a mere device or cloak to add a color of legality to price fixing and the restriction of competition *inter se*. Nor is it the *Blount* case,[41] in which each cross-licensing patentee, among other things, agreed not to compete with the others in various fields and imposed restraints on the conduct of others under their own

---

license, since du Pont acquired no such power by the agreement. Had du Pont and National Lead truly pooled their patents and adopted a joint offensive policy and concertedly used their pooled patents against their competitors, or had they pursued a joint policy in the Patent Office, etc., the matter might well be different. Such power could perhaps be said to be achieved by combination, but that is not this case. The findings of the District Court, both in what they said and what they omitted, make perfectly clear that beyond the simple, non-exclusive exchange of rights, the parties did not act concertedly in any manner.

patents and accepted restraints on its own conduct under its own patents.

The actions of the parties in this case were consistent with the complete freedom provided by their agreement. The rights exchanged or retained were widely exercised. The parties' competition with each other in the production and sale of titanium pigments was, as found by the District Court (FF 78, R. 290-1), extensive in scope and active in character. As found by the District Court (FF 84-5, R. 295-8), the only applicants to du Pont for licenses under its titanium patents were granted licenses,[42] and independently of National Lead. There is no finding, nor any evidence to support a finding, that the parties cooperated either in or out of the Patent Office or in the courts to secure patents for themselves, to defeat the patent applications of others or to stifle or impede the operations of third parties in any respect.

---

[42]Not only were such applicants, American Zirconium and Virginia Chemical, freely licensed by du Pont when they requested a license, but such licenses were equally freely subsequently broadened by du Pont. On May 7, 1943, in response to a request by American Zirconium, du Pont modified the license agreement by including 15 patents and 18 patent applications then owned by du Pont covering processes for producing rutile titanium dioxide. No increased royalty was required (FF 84, R. 295-6). Similarly, in November, 1940, the Virginia Chemical license was broadened at its request to permit it to operate under a specific du Pont patent application covering antimony treatment for chalk resistance of pigment, an improved process for the manufacture of pure titanium dioxide, at an increase of 1% in the specified royalty. And the field of the license agreement was again broadened in July, 1943, at which time du Pont on its own motion granted Virginia Chemical, without increased royalty, a non-exclusive license under the above-mentioned rutile patents and applications (FF 85, R. 297-8; Ex. R. 4293-5).

The legality of a non-exclusive, unrestricted exchange of patent rights *per se* has been sustained whenever the issue has been presented to the courts, particularly when such an exchange arose out of and determined a *bona fide* patent controversy.[43]

What, then, are the bases upon which the District Court found the agreement to be unlawful? There were three: (1) the inclusion of future patents, (2) the inclusion of a technical exchange, and (3) the tonnage limitations in the du Pont licenses to third parties (R. 219-222).

We respectfully submit that as a matter of law the District Court was in error; that this case is controlled in all substantial respects by the *Cracking* case in which Mr. Justice Brandeis in 1931 spoke for a unanimous court.[44] In that case, this Court held that the cross-licenses there involved were reasonable and lawful, notwithstanding the fact that every one of the grounds applicable to du Pont on which the District Court in this case based its conclusion that the cross-license was unlawful also existed in the *Cracking* case and was strenuously urged by the government at that time.

[44] Mr. Justice Stone not sitting.

(1) ALL OF THE FEATURES COMPLAINED OF IN THE 1933 AGREEMENT WERE PRESENT IN THE AGREEMENTS IN THE OIL CRACKING FIELD AND APPROVED BY THIS COURT.

(a) The Exchange of Rights Under Future Patents.

The District Court inferred that one of du Pont's purposes (in addition to the other three which were unobjectionable) was to strengthen its own patent position to the exclusion of others by pooling its patents with National Lead (FF 79, R. at 292), and found that the "necessary effect" of the exchange of licenses under future patents was to increase "the capacity of such a combination to dominate the market" and "the capacity for the exclusion of outsiders" (R. 220, 292). It appears to recognize what must be the fact, that these consequences follow, if at all, even from an exchange of present patent rights, but that the exchange is nevertheless lawful under the *Cracking* case if, but only if, limited to the settlement of conflicting patent claims.

However, not only did the patent exchange in the *Cracking* case include future patents,[45] but even the ex-

---

[45] In the *Cracking* case the cross-license agreements, entered into in the early 1920s, covered patents to be acquired by the parties until January 1, 1937. This fact was clearly presented to this Court by the government in its brief (pp. 16, 22-3, 29), and indeed it was stressed in the complaint as making the cross-licenses illegal. In alleging the combination complained of the complaint stated:

"By granting rights under prospective as well as existing patents provision was made for extending the combination and monopoly beyond the life of any patents now owned by the defendants. Each thus protected its patents and asserted rights against attack by the others and they were enabled to present a solid front to all manufacturers of gasoline who

change of present patents was not confined to conflicting patents.[46]

Because of the inclusion of future patents, coupled with covenants not to contest patent validity (which were deleted before the case reached this Court on appeal), the District Court, on the basis of the same line of "patent proliferation" reasoning as is used by the District Court in this case, held the cross-licenses in the *Cracking* case to be unlawful (33 F. (2d) 617, 630); but this Court reversed. In our case, the agreement between National Lead and du Pont has never contained a covenant not to contest patent validity. Thus the government, in the *Cracking* case, unsuccessfully raised every point made by the District Court in this case, including the argument of "proliferation of patents". Indeed, in the *Cracking* case, many of the third-party licensees of the parties were required to grant back rights under future patents (*Cracking* case Record, Vol. I, p. 12).

---

were compelled by competition to avail themselves of the economies resulting from the use of the cracking process" (*Cracking* case Record, Vol. I, p. 11).

The complaint went on to ascribe the following effects to such an exchange:

"to provide for the perpetuation of the plan beyond the life of any of the existing alleged patent rights by providing for a pooling of after-acquired patents" (*Cracking* case Record, Vol. I, p. 40).

[46]It was found as a fact that the principal cross-licensed patents of the primary defendants could be practiced without infringement, that subsequent to the cross-license each of the primary defendants continued to follow the teachings of its own patents, that the processes described in the claims of many of the patents were not adopted by any primary defendant not then owner of such patents, and that some of the claims of some of the patents were not followed by any of the primary defendants (33 F. (2d) 617, 625-6).

In short, this Court did not in that case require a meticulous measuring of conflicting patent claims or require that, to be lawful, a settlement of a patent controversy must be limited to precisely those patents in conflict, but rather it recognized that, at least in a fluid, fast-developing, highly complex art, it was lawful, and indeed necessary, for the parties to obtain a broad freedom to conduct their operations, rather than to compel the parties perpetually and on a piece-meal basis to settle the numerous points of conflict as they must inevitably have arisen from time to time.

Not only did the 1933 agreement between du Pont and National Lead not have the "necessary effect" ascribed to it by the District Court but that this Court in the *Cracking* case necessarily, and in the face of urgent argument to the contrary, held that exchange of non-exclusive licenses under present or future patents does not have such effect. Indeed, it would seem that if this were not so, the *Cracking* case must have gone the other way.

Under the non-exclusive, unrestricted exchange of patent rights, each party had precisely the same powers of exclusion by means of its own patents as it had had before—less, in fact, for the parties no longer could exclude each other. Even if it be assumed that the exchange of patent rights, by enabling the production of superior products, etc., increased the parties' ability to compete against third parties in the market, this increased merely the individual abilities of each, but not to the extent of either party gaining the power to fix market prices or to exclude competitors. While it is possible that the parties collectively and acting in concert could have done this, the Court expressly found (FF 78, R. 290) that no such concert of

action took place. Even if such collective power be assumed, which we submit has not been proved, surely it is a fatal fallacy to ascribe such power to either of the parties in the face of the fact, as found, that no concert of action existed. To the extent that some competitive advantage in the market accrued to the benefit of the parties as an incident of the exchange of rights, such a result was equally of necessity inherent in the *Cracking* case cross-license arrangements. Had the parties jointly asserted their patent rights against third parties, or had they acted concertedly in the Patent Office,[47] there might be ground for asserting that the parties by combination had enhanced their capacity to exclude. However, they did not do so, and the District Court did not find this, but expressly found no concert in the assertion of their patent rights against third parties (FF 84-5, R. 295-298).

With respect to du Pont's alleged intent to exclude (R. 292), the District Court's opinion (R. 220) makes absolutely clear that it was merely inferred from what the Court deemed to be the "necessary effect" of the agreement. There is no competent evidence whatsoever in the record to support the District Court's finding of inferred intent. In fact, the only competent direct evidence with respect to du Pont's intent, the contemporaneous statement by Rupprecht, made to his Board of Directors in connection

---

[47]Throughout du Pont's relations with National Lead it has at all times insisted upon independently patenting its own inventions and frequently filed applications in the Patent Office which were placed in interference with applications of National Lead. In each such instance du Pont insisted upon its rights to establish priority under and in accordance with Patent Office rules (Ex. R. 1862, 3089).

with his submission of the cross-license to the Board for its approval, is to the contrary.[48]

We submit, therefore, that the District Court's finding of necessary effect and intent, was not supported by the record, was based entirely upon an inference of "necessary effect" contrary to what this Court has held in the *Cracking* case, and should be accorded no weight.

(b) The Exchange of Technical Information

It is likewise clear that such an exchange was also involved, and of necessity sustained, in the *Cracking* case. The definitions of patent rights in two of the three principal agreements included, in addition to patents, all inventions relating to processes and apparatus, whether patented or not (33 F. (2d) 617, 626-7). The only difference between the technical information provisions of these agreements and the technical information provisions of the agreement between du Pont and National Lead is that the latter contains express agreements to disclose. Obviously, however, the licenses in the *Cracking* case of necessity had to be implemented by actual disclosure, so that the difference is without substance.

The District Court's belief that the information exchange added to the capacity of the parties to exclude outsiders is of no more substance than its same belief with

---

[48]This statement (Ex. R. 1451-1453), which sets forth what du Pont expected to achieve by the cross-license, is persuasive that du Pont's purpose did not embrace the exclusion of third parties from the titanium field. This conclusion is reinforced by the absence of exclusionary intent in the record of negotiations and the inference impelled by such evidence and the internal records of du Pont regarding the patent conflict that the securing of freedom of action for du Pont in the titanium field was the motivating force behind the agreement.

respect to the exchange of rights under future patents. The technical information exchange was also on a non-exclusive basis. Not only has neither party been restricted with respect to what it may do with its own technical information, but the agreement stated that the technical information given by each to the other should be at its "full disposal" (R. 70). *Cf. Associated Press* v. *United States*, 326 U. S. 1 (1945).

The District Court's finding (FF 95, R. 305), that the National Lead and du Pont agreement had the necessary effect of securing a monopoly on technical information to the exclusion and detriment of other producers is not only not supported by the record, but is obviously inconsistent with the other findings of the District Court. That the parties have in fact neither individually nor collectively achieved a monopoly of technical information is, we think, conclusively demonstrated by the entrance and successful competition in the field of Virginia Chemical. Although it was licensed under du Pont's patents, it never requested or obtained du Pont's technical information. And, of course, Virginia Chemical was not even licensed under National Lead's patents and did not get its technical information.

Nor, in fact, did Zirconium obtain or request du Pont's technical information.

Finally, as has been detailed at length above (pp. 17-19), the information exchange was ended at du Pont's insistence in 1940, long before the present litigation was commenced or, so far as du Pont is aware, contemplated. Even were such an exchange illegal, the matter is, on the authority of the *Cracking* case, clearly moot.[49]

---

[49] 283 U. S. 163, 181-2 (1931).

(c) The Tonnage Limitations on du Pont's Licensees

The tonnage limitations in the Virginia Chemical and American Zirconium licenses were never restrictions on the amount of titanium which could be produced by the licensees, but simply limitations on the amount which could be produced under du Pont's patents, beyond which the licensees could produce only on risk of infringement and suit for infringement (Ex. R. 282, 397). The licensees were placed under no different disability than they suffered before the execution of the agreement. In other words, the limitations amounted to nothing more than limitations upon du Pont's covenant not to sue.

Such a limited waiver of a lawful patent monopoly has always been considered to be lawful and within the patentee's rights.[50] Just as with the so-called field of use restrictions, it has never been held that the patentee has either to keep entirely to himself his patent monopoly or to release it wholly if he releases it at all.[51]

S. 669 (1891); *Burr* v. *Duryee*, 4 Fed. Cas. 806 (C. C. D. N. J. 1862), aff'd, 1 Wall. 531 (1864). But *cf. American Equipment Company* v. *Tuthill Building Material Co.*, 69 F. (2d) 406 (C. C. A. 7th, 1934). A tonnage limitation accomplishes nothing more than could be accomplished by a time limitation, which was approved in *Ethyl Gasoline Corporation* v. *United States*, 309 U. S. 436, 456 (1940).

[51] *Hartford-Empire Co.* v. *United States*, 323 U. S. 386 (1945); *General Talking Pictures Corporation* v. *Western Electric Co.*, 304 U. S. 175 (1938); *Bement* v. *National Harrow*

Similar quantity limitations were contained in various licenses issued by Gasoline Products Company and Standard Oil of New Jersey, two of the primary defendants in the *Cracking* case. (Main Brief for Primary Defendants in that case, pp. 65-9.) Such quantity limitations were alleged in the complaint to be unlawful (*Cracking* case Record, Vol. I, pp. 32-8). As in this case, however, such licenses were issued by the cross-licensing patentees under their own respective patents and not pursuant to the cross-licensing agreements or under the patents of others.

(1) American Zirconium

Even were such limitations questionable, du Pont never actually enforced them. The tonnage limitations in Zirconium's license were relaxed by agreements reached between the parties on November 18, 1937 (Ex. R. 1706), November 9, 1939 (Ex. R. 1745), and August 8, 1941 (Ex. R. 4269). These were the result of the only requests for modification made by Zirconium of du Pont, the first and third of which were granted in their entirety (Ex. R. 1706,

4269), while the second, that of September 15, 1939 (Ex. R. 1728), was granted in part at that time (Ex. R. 1745).[52]

Moreover, the tonnage limitation, in fact, never resulted in any limitation of Zirconium's production.[53] Zirconium was authorized to produce 63,000 tons of titanium dioxide in the period 1935-1944, but in fact it produced only 35,637 tons during the period, or about 56% of the licensed quantity. The following schedule shows the quantity allowed

---

[52]On September 15, 1939, Zirconium asked du Pont for permission to increase production to 9,000 tons per year beginning January 1, 1940 (Ex. R. 1728). After some correspondence and negotiations du Pont on November 9, 1939, authorized Zirconium to carry over to 1940 the entire amount of production allowed for 1939 but not utilized, thus permitting Zirconium to produce 6,719 tons in 1940; and this modification was accepted by Zirconium (Ex. R. 1745). During the year 1940, Zirconium, however, produced only 4,829 tons (R. 1147), and after renewing its request was authorized to produce 9,000 tons for 1941 and subsequent years (Ex. R. 4269).

[53]The only evidence to the contrary is the following: In support of its request of September 15, 1939, Zirconium indicated that it was prepared to expand its plant to enable it to produce 9,000 tons (Ex. R. 1737); stated that the company hesitated to expand to a 9,000-ton unit which would assure at least a 6,000-ton production solely because the additional investment might result in production in excess of 6,000, which went beyond the quantity permitted under the license agreement (Ex. R. 1743), and argued that the quantity limitation prevented operations on a profitable basis (Ex. R. 1737).

However, that these representations were mere argument, not justified by the facts, is clear. As late as November, 1941 (after du Pont had relaxed the tonnage limitation to permit a production of 9,000), the question of increasing Zirconium's capacity sufficiently to enable it to produce 9,000 tons was still under discussion by its directors, and it appears conclusively from Zirconium's own minutes that directors representing Metal & Thermit and National Lead which together held 55% of the Zirconium common stock, were unwilling to make available capital necessary for the increase, for a variety of reasons involving the question

under the modified license, the actual production of Zirconium, and the ratio of actual production to the allowed amount for each of the years 1935-1944:

	Quantity Specified in License as Amended[54]	Actual Production[55]	Ratio Production to Specified Quantity
1935	3,000	2,206	73.53%
1936	3,000	3,053	101.76
1937-38	9,000	7,713	85.70
1939-40	12,000	10,110	84.25
1941	9,000	6,568	72.97
1942	9,000	1,796	19.95
1943	9,000	243	2.70
1944	9,000	3,948	43.86
TOTAL	63,000	35,637	56.56%

of the adequacy of the company's management and the business soundness of the project (Ex. R. 4042, 3974, 3990, 3978, R. 1086, 1089, 1094). It is also clear that in 1939 Zirconium operated at a profit (Ex. R. 3978). Indeed, the record shows that Zirconium's operations were profitable in 1937, 1938, 1939, and while a loss was experienced in 1940, profits again appeared in 1941, these profits being made in spite of substantial sales commissions and management fees paid to parent companies (Ex. R. 3978, 3979). Thus, it appears that Zirconium's production of titanium dioxide was not in fact restricted by the tonnage limitations, but by factors not within the control of du Pont, and that du Pont, whenever requested, and to the full extent necessary, authorized relaxation of the quantity limitation.

[54]Ex. R. 283, 1706, 1745, 4269.

[55]R. 1147—with 1944 production estimated on basis first six months' production.

(ii) Virginia Chemical

As in the case of Zirconium, the quantity limitations in the Virginia Chemical license were frequently relaxed, either at its request or voluntarily on du Pont's part. There was no instance where a request for modification was made which was not granted by du Pont. In the short period from October, 1937, to August, 1941, Virginia Chemical was granted six specific relaxations of the quantity restrictions. The modifications were made on October 11, 1938 (Ex. R. 1818), March 9, 1939 (Ex. R. 1823), November 21, 1939 (Ex. R. 1825), August 5, 1940 (Ex. R. 1827), May 21, 1941 (Ex. R. 4287), and August 8, 1941 (Ex. R. 4290).

The liberality and flexibility of these modifications may be seen from the fact that while the original license agreement provided for a quantity of 3,000 tons in the period of October 1, 1939, to September 30, 1941, this amount was increased on request of Virginia Chemical, first to 3,600, then, to 4,500, and finally, to 5,000 tons (Ex. R. 1823-1827).

As modified, the license agreement permitted for the period October, 1937, to September, 1944, a total tonnage of 43,000, but Virginia Chemical was not able to produce this quantity, and produced in the period only 33,572 tons (R. 1147), or about 78% of the licensed amount.[56] In fact, the largest production of Virginia Chemical occurred in 1943-1944, at a rate of 6,437 tons in 1943 and 7,294 in 1944 (R. 1147), during which Virginia Chemical was authorized under the license to produce 9,000 tons per annum.

---

[56] A schedule showing the ratio of Virginia Chemical's actual production by years to the allowed amount, such as was presented with respect to Zirconium, was not set forth, due to the inadequacy of record data.

There is no evidence that Virginia Chemical ever objected, at the time of the negotiation of the license or subsequently, to the quantity limitations, and in the absence of evidence, it may be assumed that no objections were made. Similarly, since there is no evidence to the contrary, it may be assumed that Virginia Chemical operated under the license at a profit.

Finally in November, 1944, prior to the trial of this cause, although subsequent to the filing of the complaint, du Pont voluntarily canceled the quantity limitations in both the Zirconium and Virginia Chemical licenses (FF 84-5, R. 295, 297). Even if it is believed that the quantity limitations were improper, it is submitted that this action renders the question moot. It is beyond the power of du Pont to reinstate the limitations in those licenses, and injunctive relief is, therefore, completely unnecessary. Such was the holding in the *Cracking* case, in which similar action was taken after the trial had commenced.

(2) THE DECISION OF THIS COURT IN THE *CRACKING* CASE IS CONTROLLING

We believe we have shown that the legality of the agreement between du Pont and National Lead, and even the District Court's findings of "necessary" effect and intent are controlled in every substantial respect by the *Cracking* case and that such agreement substantially promoted rather than restrained competition and trade. Indeed, the District Court, in its opinion (R. 222), unconsciously in effect conceded this when it assumed "that such exchange of rights standing alone is lawful". It went on, however, to state that the agreement is an instrument of restraint because the parties were the only producers of

titanium and even at the time of the trial between them did approximately 90% of the titanium business in the United States. The *Cracking* case was no different, for the licensor parties included the largest producers in the industry, and with the licensees substantially all of the large producers in the industry were within the contractual orbit.

In this connection, the Court referred only to the *Associated Press* case, 326 U. S. 1 (1945), in which newspapers controlling 96% of the total news circulation of the United States had made their news sources available to each other. The citation was inapposite. The vice of the Association in that case lay in the *exclusive nature* of the arrangement, coupled with the by-law provisions giving each member, in effect, the power to *exclude competitors* from membership in the Association. In short, each member of the Association was not only bound not to furnish news to non-members, but each member had the power to prevent non-members from obtaining access of the news of each and every other member. No comparable power on the part of either du Pont or National Lead by virtue of their agreement, or otherwise, existed or has in fact been exercised. In fact, the Court found to the contrary.[87]

---

[87]That this distinction is valid has been hitherto recognized by the Department of Justice. In 1930, it filed a complaint against Radio Corporation of America, General Electric Company, Westinghouse Company, American Telephone and Telegraph Company, and others in the United States District Court for Delaware. These companies, substantially occupying the entire radio field, were parties to an exclusive cross-licensing arrangement. The Department of Justice consented to the entering of a consent decree against certain of the defendants which enjoined the recognition of any of the cross-licenses as exclusive. The Department also dismissed its complaint against American Telephone and Telegraph Company and Western Electric Company, who, with the approval of the Department, had substituted non-exclusive cross-licenses between them and the Radio Group for the prior exclusive cross-licenses.

If wholly unrestricted, non-exclusive exchanges of licenses are to be held invalid, we believe that it is obvious that progress in the arts and sciences and effecting competition will be seriously impeded, and particularly so in this industry, as to which the District Court found that the cross-license promoted the more rapid development of the art and a greater freedom of action of the parties (FF 79, R. at 293).

PART TWO

THE PROVISION IN THE DECREE COMPELLING DISCLOSURE OF EXISTING AND FUTURE TECHNICAL INFORMATION SHOULD IN ANY EVENT BE ELIMINATED.

Assuming *arguendo* that the decree below is to be affirmed on the merits as to du Pont, we turn to an aspect of such decree. Du Pont contends that the provisions of this decree compelling it to disclose its existing and future technical information are improper both on the ground that the District Judge had insufficient power to order such disclosure and on the ground that his order constituted a serious abuse of discretion and operated contrary to the objectives of the Sherman Act. We say that the District Judge was without *legal power* to order disclosure of technical information under the rule of the *Hartford-Empire* case, 323 U. S. 386, and in the light of well established equity doctrines. We say that the District Judge, moreover, *abused his discretion* in that the order as to disclosures of technical information was unnecessary to permit competitors to operate under the compulsorily licensed patents, that disclosure will destroy competition which now exists and bring competitors closer together, that disclosure will remove incentives for future technological advancement, and that disclosure is wholly onerous and unnecessary in view of the fact that its exchange was discontinued between du Pont and National Lead long before the suit was initiated and more than six years ago.

The provision in question appears in a single sentence in the middle of paragraph 7 of the decree, as follows:

> "During a period of three years from the date of this decree such license [the compulsory license] or

> reciprocal license may at the option of either party contain a provision for the imparting in writing, at a reasonable charge, by the licensor to the licensee, of the methods and processes used by the former at the date of the license in its commercial practice under the licensed patents in connection with the production of titanium pigments".

The various points concerning this provision will now be discussed below:

1. The District Court Exceeded Its Legal Authority

The power of a court in a Sherman Act proceeding to compel the compulsory licensing of technical information was considered in the *Hartford-Empire* case, 323 U. S. 386, at 418, and this Court there held that, like royalty-free licensing, compulsory licensing of technical information was an inappropriate remedy even in a situation such as was there presented involving most extreme forms of restraint. On this issue there was no dissent. Paragraph 24 (c) of the *Hartford-Empire* decree was summarized by this Court as being

> "(c) to make available to any licensee, under '(a)' and '(b)' [the compulsory licensing provisions], at cost, plus a reasonable profit, all drawings and patterns 'relating to the machinery or methods used in the manufacture of glassware' embodied in the licensed inventions (with immaterial exceptions)" (p. 413).

This Court then ruled:

> "Paragraph 24 (c) should be deleted" (p. 418).

There is no possible warrant for distinguishing the two cases so as to impose a more severe decree in this respect

on du Pont in the present case than was imposed upon the Hartford-Empire Company and its co-conspirators. If this Court does uphold this provision in the present case, its decision must necessarily be read as overruling the *Hartford-Empire* case. Yet the *Hartford-Empire* case was decided only two years ago, and was reaffirmed on rehearing, after there had been two extensive and thorough oral arguments.

If any distinction is to be drawn between the cases, surely it must be one favorable to du Pont. The whole tenor of the District Judge's opinion and findings in this case are charged with recognition of the relatively very moderate degree to which du Pont was implicated in violation of the law, if at all. Moreover, in the *Hartford-Empire* case, the technical information involved was limited to drawings and patterns. In this instance the "methods and processes" used in commercial practice require the disclosure not alone of plant layouts and other information comparable to drawings and designs, but require the disclosure of information which in the last analysis is buried in the minds of persons skilled in the art and in intimate daily contact with the operation of the processes.

We need hardly remind this Court of the contrasting position of many of the Hartford-Empire defendants. Its violations of law were deliberate, continuing and even shocking. As Mr. Justice Black said in dissenting, 323 U. S. at 436-437:

> "The history of this country has perhaps never witnessed a more completely successful economic tyranny over any field of industry than that accomplished by these appellants".

Mr. Justice Rutledge in his dissenting opinion, 323 U. S. at 439, stigmatized the defendants' conduct as a

> "long adventure in monopoly and unlawful restraint of trade".

And the majority opinion itself held, 323 U. S. at 406, 407:

> "It is clear that, by cooperative arrangements and binding agreements, the appellant corporations, over a period of years, regulated and suppressed competition in the use of glassmaking machinery and employed their joint patent position to allocate fields of manufacture and to maintain prices of unpatented glassware".

In our case, du Pont had no part in any allocation of fields of manufacture. It had no part in any program to maintain prices. Competition under all significant headings clearly existed between it and other United States producers. As summarized in 4 *Pomeroy's Equity Jurisprudence* (5th Ed., 1941) 943:

> "It is, however, a familiar doctrine that a court of equity will not exercise its jurisdiction to grant the remedy of an *affirmative* specific performance, however inadequate may be the remedy of damages, whenever the contract is of such a nature that the decree for its specific performance cannot be enforced and its obedience compelled by the ordinary processes of the court. A specific performance in such cases is said to be impossible; and contracts stipulating for personal acts have been regarded as the most familiar illustrations of this doctrine, since the court cannot in any direct manner compel an actor to act, a singer to sing, or an artist to paint."

Compare *Rutland Marble Co.* v. *Ripley*, 77 U. S. 339, 358-359 (1890) ("Another serious objection to a decree for a

specific performance is found in the peculiar character of the contract itself, and in the duties which it requires of the owners of the quarries. These duties are continuous. They involve skill, personal labor, and cultivated judgment. It is, in effect, a personal contract to deliver marble of certain kinds, and in blocks of a kind, that the court is incapable of determining whether they accord with the contract or not." *Id.*

True, the doctrine ordinarily finds application in the refusal of an equity court to enforce personal contracts in an affirmative way. But the principle underlying the rule, *i.e.*, the impracticableness of judging adequate performance, applies equally to the provision of the District Court's decree. It is one thing to order the granting of a license under a patent and quite another thing to order an exchange of technical information. The former requires the exercise of ministerial acts on the part of the persons subject to the order; the latter calls for the rendering of highly specialized services by them which it is impracticable for a court of equity to police.

2. The District Court Abused Its Discretion

Even if this Court finds that the District Judge had legal authority to order compulsory licensing of both existing and future technical information, the present record demonstrates that such an order is not necessary to promote competition in the titanium pigment industry as it has now existed for many years past. Neither American Zirconium which entered the industry in 1934, nor Virginia Chemical which entered the industry in 1935, ever exchanged technical information with or received it from du Pont (*supra*, pp. 20-23, 100). Both compete successfully

with National Lead and du Pont; Daley, General Manager of du Pont's Pigments Department, characterized the competition of American Zirconium and Virginia Chemical as "tough" (R. 1159). The government did not challenge his position by other testimony or documentary evidence and did not even cross-examine him with respect to it (R. 1168-1172). In fact, the government did not call a representative of either Zirconium or Virginia Chemical and presented no proof that technical information was required for prospective competitors.

National Lead exchanged limited technical information with Zirconium (*supra*, p. 22). But this is no reason for compelling du Pont to disclose its technical information. American Zirconium has competed in the industry up to the present time without it. Furthermore, Virginia Chemical has never exchanged with or received technical information from National Lead. This has not prevented Virginia Chemical from competing in the industry. What it has done, others can do.

Moreover, the compelling of competitors to disclose to one another their technical information would seriously reduce the incentive to make developments, to the ultimate disadvantage of the consuming public. It is the theory of our economic system that research, development and progress will be stimulated by the rewards to be gained in competition as a result of superior quality, lower costs, etc. The thing that impels development is the competitive advantage, frequently even a temporary one, to be gained by the one making the development and the correlative fear of competitive disadvantage from falling behind in the race for improvement. If the producers in this industry must turn over their developments to their competitors and may ex-

pect to receive the developments of their competitors, the "pleasure-pain" motive will obviously be diminished.

There is a vital distinction between exchange of information in an infant industry and exchange in a matured industry. In an infant industry, where one company has gained a great initial advantage, competition will often benefit if a way can be found to compel or induce an exchange among competitors. As an industry matures, however, and there become available chemists skilled in the art, competitors are able to operate without access to the secrets of operation of each other, and indeed competition to a considerable extent becomes competition in the field of research and development of new products, new uses and better qualities.

The District Court's own finding is eloquent on the entire subject (FF 78, R. 290):

> "78. From 1933 on there was active competition between NL and DP for customers. There has been a vast increase in sales; and repeated reductions in the price of titanium pigments have taken place and a very few increases. * * *
>
> "NL and DP have endeavored to match each other's titanium products; but each also manufactures certain titanium pigments having special applications not manufactured by the other.
>
> "There is no allocation of territory or customers between NL and DP; and each maintains a large, highly trained technical sales force engaged in endeavoring to sell titanium pigments. To a very large extent the salesmen of the two companies are chemists whose contact with consumers (that is, manufacturers of paint, rubber, glass, etc.) consists in endeavoring to demonstrate that their products merit acceptance on the basis of technical superi-

ority. The buyers of titanium pigments are mainly well-informed, experienced purchasing agents. NL and DP sell for identical prices; there is no evidence that such price identity is the product of agreement or collusion".

There is an evident distinction between compelling the grant of a non-exclusive license on uniform, reasonable terms, on the one hand, and compelling disclosure of technical information, on the other. The first only removes a barrier otherwise imposed by the legal monopoly conferred by the patent laws. The second removes an incentive to compete.

The fact is that the chief reason the District Court ordered a compulsory exchange of technical information doubtless is that National Lead, for the purpose of getting into a position where it would be able to have the competitive benefit of du Pont's technical information built up during the period of du Pont's total independence under this heading from National Lead, conceded in the hearings on the decree that this would be a proper remedy. Du Pont, of course, has no objection to National Lead disclosing its technical information. But du Pont should not be prejudiced by National Lead's concession.

Nor do we need in this case to contend for an absolute rule against insertion of such a clause in any decree, although we believe that the order by this Court to delete the clause in a case so strongly favorable to the government on the merits as the *Hartford-Empire* case is a decision to that effect. In this case, suppose that the exchange of technical information between National Lead and du Pont had continued unabated until the date of the decree, or at least until the commencement of the suit; it might well have been argu-

able that, under those circumstances, the Court ought to have done what it did here in order that new competition might be let into the industry with equal access to the presumably pooled information. Indeed, this was what the situation was in the *Hartford-Empire* case. The District Court's opinion, 41 F. Supp. at 553, discloses that the exchange of technical information there involved had always been important and continued to be up to and including the commencement of the litigation:

> "The agreement not only divided the fields of wars by giving the container field to Hartford and the non-container field to Corning, but it eliminated the impending competition between Hartford and the Corning interests in the glass making machinery field. In this connection it is well to note that Corning had 'consistently maintained that the contract was *a continual exchange of inventions and developments for prescribed fields regardless of patents*'". (Italics supplied.)

In addition to urging the current importance of the exchange of technical information in the glass industry, the government argued in the *Hartford-Empire* case that compulsory granting was "necessary to give full effect to the licensing requirement and to avoid useless and perhaps costly repetition of experiments already performed" because "patents as complicated as those here involved seldom reveal all of the details essential to the manufacture and operation of the patented invention" (Brief on Rearg. in this Court, 143).

To do as the Court has done in this case, viz. to attempt to compel exchange of secret technical information independently developed which has been withheld, because of

the existence of competition, for more than seven years last past, can only be justified if this Court is in effect now going to say that the *Hartford-Empire* decision was so entirely wrong that hereafter the rule must be that in all cases involving patents under the anti-trust laws, there must be inserted in decrees a provision for compulsory disclosure of the secret technical knowledge known to the parties as of the date of the decree.

And on the specific subject of exchange of information, du Pont's record is a singularly good one. The critical fact is that du Pont terminated all exchange of technical information with National Lead early in 1940. It told National Lead of this decision in the Spring of 1940 (Ex. R. 1926-1939), obtained National Lead's confirmation on April 29, 1940 (Ex. R. 1942), and added further assurance by a formal document as of January 1, 1941 (R. 73). The decisive action was, therefore, taken more than four years before the commencement of this action. In other words, du Pont's decision to terminate all exchange of technical information with National Lead was an independent decision, taken neither under threat of suit nor under compulsion of law nor of national policy.

Indeed, even before 1940 du Pont had strictly limited the field of exchange of information. We have given under the Statement of the Facts a detailed history of that exchange. Summarized, it was that in 1933 the art was still in its infancy and it was impossible for any company to engage in full competition with the American member of the international cartel, unless it could obtain access to the accumulated technical information at that time; that within three years, however, the spirit of competition had developed to the point at which already the parties were

commencing to hold back information from one another (Ex. R. 4309); that in 1937 the parties contractually restricted the exchange of information; and, finally, that by April, 1940, du Pont determined to withdraw completely from any exchange. The effect of its decision was dramatically evidenced by the document in the record which showed that a year later a representative of du Pont, in the hopes of knowing what National Lead was doing, had to reach his conclusion by standing outside the gate of National Lead's plant and counting the number of smoke stacks in operation (Ex. R. 4321).

We respectfully submit, therefore, that whatever be the decision as to the merits, the fourth sentence of paragraph 7 must be stricken from the decree.

APPENDIX A

KREBS PIGMENT & COLOR CORPORATION

June 28, 1933.

CONFIDENTIAL

W. C. BESCHORMAN, Vice Pres.,
National Lead Company,
111 Broadway,
New York City, New York.

Dear Mr. Beschorman:-

We have considered the various points raised by I. G. in their cable to you with the desire, if possible, to comply with its request.

As you are aware, the Anti-Trust Laws of this country definitely prevent this Corporation from making any commitments respecting the territories of Titangesellschaft and Titan Inc. Further, these several companies are not parties to the Krebs-Titanium Pigment Agreement and so, as to them, we are unable to make any direct commitment. However, since Article II of the Krebs-Titanium Pigment Agreement definitely provides that Krebs is limited both in respect to use and sale to the territories set forth in this Article, we think the result will be eminently satisfactory to your foreign associates. As to controlling the disposition of our products by our customers, we are sure you appreciate the difficulty both from a legal and practical standpoint.

The I. G. request that Krebs grant no sub-licenses or technical aid to others in the territories of the foreign companies, is tantamount to obligating Krebs to grant exclusive licenses. The whole agreement, you will recall, for definite reasons, was placed on a non-exclusive basis. Since all licenses received from Krebs under its foreign patents, are

subject to negotiation, we believe there will be no difficulty in working out a solution that will be acceptable to all parties; it may well be that such negotiations will result in exclusive licenses to your foreign associates. Naturally, we shall treat technical information in the same manner as our patents.

The present form of our Agreement is the result of much care and thought on the part of both parties. It embodies, as we see it, a practicable working basis for both companies, as well as for your foreign associates.

Very truly yours,

C. H. RUPPRECHT,
President.

July 12, 1933

I. G. Farbenindustrie
Aktiengesellschaft
Frankfurt (Main)
Gruneburgplats.

Dear Sirs:

Immediately upon receipt of cablegram of June 22nd from Dr. Jebsen, a copy of which is attached, we took the matter up with the Krebs Pigment & Color Corporation, submitting to them a copy of the cable, and take pleasure in handing you a copy of their reply under date of June 28th. Careful reading of the Krebs letter will surely indicate to you the spirit in which they are entering into this contract and their efforts to meet your views. We feel that experience will prove that such will be the case.

In regard to the phrase "non-exclusive license" to which you call our attention as occurring in Article 5, Paragraph 2, we have to refer to the United States Anti-Trust Laws which absolutely forbid the granting of exclusive license between two manufacturers in the United States as such

a practice would tend to create a monopoly. Therefore, the use of this phrase "non-exclusive license" is simply to comply with the United States Laws and in practice the licenses under each others patents will undoubtedly prove to be, to all intents and purposes, exclusive.

Referring subsequently to the points brought out in your letter of June 20th, under A, B, C, D and E, you will note that the Krebs Company consider themselves limited both as to use, manufacture and selling to the territory granted to them by the agreement. While this agreement does not specifically prevent Krebs from exporting into your territory any products not manufactured under the patents of the Titanium Pigment Company and its associated companies, it will be a difficult matter to discriminate between such manufacture and manufacture under their patents and maintain close and good co-operation, and the practical effect will be that Krebs will refrain from such export.

As to exports by clients of the Krebs Company, we note that Krebs will use all their efforts to prevent any export outside of their territory which would cause any trouble to you in any way.

In regard to licenses, although non-exclusive licenses are specified throughout the agreement, you will note from the letter of Krebs Company that they are not adverse to granting exclusive licenses in case this may be found desirable by you. Under the practice, as we foresee it, these licenses will be given against a nominal payment except in cases of outstanding development.

We also see your point, that by the exclusive license you have given Titan Co. Inc., which has granted exclusive licenses to the Titanium Pigment Co. Inc., you are not in a position to trade with Krebs regarding any American patents belonging to you. However, you may rest assured that your interest in these respects, which are also our own interests in view of our part ownership in the Titangesellschaft, will be fully and completely looked after.

At one time we considered the question of an agreement between the Titangesellschaft and Krebs covering the points in your letter, but have dropped this idea as we felt that you would be better served to have us look after your interests than to complicate the situation with a separate contract.

The only other point in your letter which we do not believe has been covered is your suggestion that the contract be changed from termination in three years to termination in five years. Frankly, there is no possibility of the contract being terminated at any time that we can foresee, and I am glad that you did not make any especial point of this either in the cable or in your letter of June 20th.

May I add that we certainly appreciate your attitude and the views you have put forward in your letter to Dr. Jebsen and trust that you will not be disappointed in the future by following the lines we have suggested. May we ask for further advice from you as to whether the Krebs letter and above make the whole matter satisfactory.

Very truly yours,

W. C. BESCHORMAN,
Executive Vice President.

APPENDIX B

ANALYSIS OF THE DISTRICT JUDGE'S OPINION ON THE ISSUES INVOLVING DU PONT SHOWS CLEARLY HIS ERRORS OF FACT AND LAW.

1. The District Judge's Heading II

The issue of du Pont's relation to the international cartel is treated in the portion of the District Judge's opinion numbered "II" and commencing at R. 213.

(a) The District Judge found a sharp deviation and contract between the conduct of du Pont and that of the other defendants, with which du Pont competed.

(*First paragraph of Opinion, R.* 213)[1]

The opinion gives a clear picture of just how the Judge settled the issue. In his opening sentence, the Judge *contrasted* the du Pont case with the National Lead case, saying for du Pont that

> "the facts are by no means as clear"

as for National Lead. The Judge then recognized that:

> "much of the evidence supports its [du Pont's] denial" of "an complicity in the combination".

The attention of this Court is respectfully called to the fact that the Judge was thus not merely pointing out that there was an insufficiency of evidence under many headings. He was saying that there was "much" affirmative evidence to support the denial of "any" complicity whatever.

---

[1]These italicized references in parentheses are to the respective paragraphs of the Opinion below, with record references.

This Court will recall that the 1920 agreement was the basis of the cartel. The Judge said not merely that du Pont

> "did *not* subscribe to the 1920 agreement"; [italics ours, in all quotations]

he went on to say that

> "the agreement it [du Pont] did sign, in 1933, *deviated sharply* from the form and from the principles of the 1920 agreement".

This "sharp deviation" was apparent, in that the du Pont agreement provided only for an exchange of non-exclusive licenses under patents with National Lead and for an exchange of technical information, and contained no territorial or other commercial restraint. The Judge further pointed out that:

> "In 1940, it [du Pont] withdrew from the exchange of technological information with NL".

Thus, four years before this action commenced, the agreement between du Pont and National Lead had been reduced to a patent license agreement, without even any exchange of technical information added.

The next question was as to the substance of competition between the two in the United States. On this, the Judge said:

> "It [du Pont] competed with NL for the American market".

(b) The District Judge recognized that if du Pont was a member of the combination at all, it was not a regular member.

The next question was as to the markets outside the United States. On this the Judge said:

> "It [du Pont] was never regarded by the Titan group as a full fledged member of their family. Its anomalous position was the subject of frequent discussion and apprehension among the Titan members, and efforts were made to convert DP into a fully conforming member".

On the whole, this was also an entirely favorable decision to du Pont. But the Judge was here (for the first time) shading his decision a bit. While recognizing that du Pont's independence was a source of "apprehension" to the cartel, and that the cartel therefore considered it necessary to endeavor "to convert DP", he did not quite hold that du Pont was completely free of contamination. He held that du Pont was not "a full" fledged or "a fully" conforming member. Here we have a narrow issue between ourselves and the Judge: Whether he was entitled to hold that this admittedly non-conforming and unconverted party [du Pont], which was even causing apprehension to the members of the cartel, must nonetheless be itself held to have been a member to such an extent as to bring down upon it the severe consequences visited by our law on a conspirator.

(c) The District Judge also recognized that du Pont had an alert consciousness of the anti-trust laws, violation of which it was at least seeking to avoid.

(*Second paragraph of Opinion, R.* 213)

The Judge, in passing from his introductory paragraph to his analysis of the evidence relative to du Pont, referred once again to the

> "sharp contrast"

between the disregard by National Lead of the Sherman Act and the postion of du Pont, which

> "exhibited, from the very beginning of its interest in titanium, an alert consciousness of the anti-trust laws and moved cautiously and under the guidance of trained anti-trust lawyers".

This could hardly in itself be a ground of condemnation of du Pont,—rather the contrary. At least, it was trying to comply with this complex of laws known as the Sherman Act. The point is not without significance on any issue of purpose or intent.

The Judge then posed this question and gave his answer:

> "The question is whether it [du Pont] succeeded in avoiding not only the form but also the substance of transgression".

This seems to admit that du Pont did avoid the "form" of transgression. The thought is that its "trained anti-trust lawyers" saved it from that. That certainly does not permit an inference that it transgressed in "substance". Astute as the Courts sometimes are to separate substance from form, they have hardly reached the stage of imputing guilt in substance *because* none is apparent in form. The inquiry must be whether there is substantial evidence *aliunde* that the substance was indeed different from the form. The Judge himself of course concluded that there had been transgression:

> "I have concluded that it has not [avoided the substance of transgression]; and I arrive at that conclusion by the following analysis of the facts".

(d) The District Judge also recognized that du Pont's purpose and intent was to obtain access to patents and technical information. This was obviously lawful.

(*Third paragraph of Opinion, bottom R.* 213)

The Judge's "analysis of the facts" opened, quite properly, with a consideration of du Pont's *purpose*. We say "quite properly" because the *purpose* of the defendant has always been held by this Court to be of pre-eminent importance in anti-trust cases. Was the purpose of du Pont directed to some commercial objective such as price-fixing or territorial limitation, or was it directed to a subject not repugnant to the anti-trust laws, such as the obtaining of licenses under patents? Here is what the Judge says:

> "DP was manifestly eager to obtain access to NL's patents and skill in the titanium field".

Surely, that also is favorable to du Pont.

The next sentences do not derogate at all from this conclusion, but deal exclusively with the motives and purposes of National Lead, concluding with a statement that National Lead was limited by its agreement with the Europeans that, before National Lead could license du Pont under its patents, National Lead must obtain du Pont's adherence to the principles of the 1920 agreement. But:-

> "Such adherence, DP refused. The reasons assigned by DP for its refusal were several, and varied from time to time, but always conspicuous among them was the claim that its adherence was forbidden by the anti-trust laws".

Again, surely a finding entirely favorable to du Pont. The Judge was evidently concluding that whatever its conduct, at least the *purpose* of du Pont was innocent. It

will appear that he failed thereafter to give sufficient weight to this conclusion which ought to have been of paramount importance.

(e) The District Judge further recognized that the 1933 agreement was drawn under the principles established by this Court in the *Cracking* case, 283 U. S. 163.

The Judge then turned to the written contract of 1933 between National Lead and du Pont:

> "In this troubled atmosphere, the 1933 agreement was drawn, after long negotiation, by lawyers who were aware of the then recent decision in the Gasoline Cracking case. *Standard Oil Co.* v. *United States,* 1931, 283 U. S. 163".
>
> (*Paragraph at middle R.* 214)
>
> "Carefully, they cast the agreement into the form of a settlement of patent disputes".

Again, we ask: What better could they have done than "carefully" to follow the recent decision of this Court? But the District Judge seemed troubled by some idea that the fact that the agreement was a "settlement of patent disputes" must in itself be somehow suspicious. Surely, the agreement speaks for itself, particularly in view of the fact that the Judge expressly *found* that du Pont and National Lead were engaged in a *bona fide* patent dispute (FF 72, R. at 279).

The Judge noted one element in the agreement as "disturbing". Was it some offensive clause, or clauses? Not at all. It was again suspicion, for the "disturbing" element was only that its terms were in the Judge's opinion "vague". But du Pont was unharmed by that, except atmospherically, for once again the Judge drew no direct

inference against du Pont. He did draw an inference against National Lead, because one of its officers wrote that

> "the vagueness in the writing is deliberate and the product of fear of the anti-trust laws".

Du Pont did not have a copy of that letter, and

(*Paragraph commencing bottom R.* 214)

> "Consequently I draw no inference therefrom against DP; but I do draw an inference as to NL's frame of mind in its negotiations with DP".

This is but one of the many examples of a continuing difficulty that du Pont was under throughout the entire trial, in that National Lead and its associates provided documentary evidence that the anti-trust laws did not bulk large in their deliberations; and although this was not known to du Pont, there was a tendency for du Pont to be contaminated.

With du Pont it was just the opposite. It was determined not to violate the law. For example, the Court will recall that in and after 1933 National Lead attempted frequently to explain to its own associates its failure to bring du Pont into the conspiracy by ascribing du Pont's refusal as due to du Pont's concern about the anti-trust laws,—at the same time seeking to cover itself with its associates by suggesting that it would try to prevail upon du Pont to go along anyway. But it never succeeded.

(*First paragraph, R.* 215)

The Judge here turned to evidence outside the cross-licensing agreement itself,—evidence of its negotiation.

(f) The District Judge, however, concentrated attention on two documents—two letters written at the time to prevent the Germans from voiding the license agreement of 1933.

He held that the material evidence reduced itself to two documents, which he set out in the margin (R. 228-231) and which we have reproduced in Appendix A. Before they are considered, it is necessary to understand their background. National Lead had been bound to its foreign associates, by Article XIV of the Contract of 1920 and the other cartel agreements, not to pass on to American competitors information received from its foreign associates unless the American competitors should in turn agree to adhere to the "principles" of the Contract of 1920. National Lead's German associates [I.G. Farbenindustrie and its affiliated companies], the only ones of the cartel who were then in actual production in Europe (Ex. R. 3623), were particularly concerned lest du Pont as a competitor should acquire from National Lead the technological information supplied to National Lead by the Germans themselves and then should export into the Germans' territory products made in consequence of acquisition of that information.

The problem before du Pont was whether to abandon the contract, and thereby to renounce access to the patents and information developed by the cartel and in the possession of National Lead, or whether to make an effort to save the agreement by assisting National Lead to give some reassurance to the Germans. As the cartel and National Lead were obviously in possession of the greater part of all the information in the world about titanium, renunciation of the agreement by du Pont would be in effect an admission that the cartel had a monopoly and that du Pont could not enter into business in competition with it.

(g) But the District Judge recognized that the first document—a letter from du Pont—did not violate the law.

Du Pont therefore set out to find a formula whereby the Germans could be quieted so that National Lead could sign the agreement, but without du Pont itself entering the cartel or making any territorial agreement or commitment.

Du Pont accomplished this by writing the first of the two documents in question, a letter from Rupprecht, President of Krebs, to National Lead's Vice-President Beschorman; and the Judge indeed found that in this letter du Pont avoided transgression of the law. He could hardly have found otherwise. In this letter (R. 228, quoted in full in Appendix A), dated June 28, 1933, Rupprecht said that he had considered the various points raised by the Germans; that the anti-trust laws "*definitely* prevent this Corporation from making *any* commitments respecting the [European] territories"; that "the whole agreement, you will recall, for definite reasons, was placed on a non-exclusive basis"; etc. In sum, the letter was a carefully drawn statement that du Pont was prevented by the anti-trust laws from making any agreement or commitment.

The District Judge, we think quite rightly, attached no importance to the few polite phrases in Rupprecht's letter which were evidently meant to let the Germans down easily, for example, "with the desire, if possible, to comply with its [I. G. Farbenindustrie's] request"; that since the cross-licensing agreement with National Lead "definitely provides that Krebs is limited both in respect to use and sale to the territories set forth [North and South America] * * *, we think the result will be eminently satisfactory to your foreign associates"; and the like. It would have served no purpose for du Pont to be rude or unfriendly. What it wished was to get the substance of the rights under the

German inventions and technological development, in so far as they could be [illegible]d through exchange of information with National Lead, without having to give away anything in return other than general expressions of good-will. And this is what was accomplished.

(h) The District Judge then pinned his decision adverse to du Pont on a single document, one written by National Lead, not by du Pont.

The second document (R. 229, also quoted in full in Appendix A), was not a du Pont letter at all, but was one from Beschorman (Vice-President of National Lead) to the Germans, dated July 12, 1933, of which a copy was sent to Rupprecht. The Judge *based* his decision against du Pont on this letter from National Lead to the Germans, saying:

(*Second paragraph, R.* 215)

> "If DP is bound by the second letter, it unquestionably joined the conspiracy then in effect between NL and its foreign associates".

We pause here to remark that it is a result which at least invites careful scrutiny by the appellate court when in a major litigation the trial court holds a defendant liable for violation of the anti-trust laws, notwithstanding the innumerable important findings in that defendant's favor which we have just reviewed, upon the basis of one document not written by or on behalf of that defendant itself and where, as we will see, the independent proof *aliunde* is wholly dependent upon inference.

(i) That National Lead letter, addressed to the Germans, itself enclosed the innocent du Pont letter which stated du Pont's position. The National Lead letter ought not, therefore, to have been construed apart from the enclosed du Pont letter, or in disregard of du Pont's conduct.

We suggest that, quite apart from the error of proportion involved in ascribing such importance to one letter,

it ought not to have been even construed alone, but with the Rupprecht letter. As Beschorman's letter transmitted Rupprecht's letter, the former ought not to be construed against du Pont independently from and as adding to the latter. Indeed, Beschorman himself opened to I. G. Farbenindustrie by requesting them to read Rupprecht's letter carefully:

> "A careful reading of the Krebs' letter will surely indicate to you *the spirit* in which they are entering into this contract and their efforts to meet your views. *We* feel that experience will prove that such will be the case".

The first of these sentences was obviously sales talk and left the Germans nothing better than what they could obtain from "a careful reading" of the Krebs' letter itself, which, as the Judge himself appears to agree, could not be the basis of a decision against du Pont. The second quoted sentence was merely an expression of opinion by National Lead itself about the future, and as thirteen years have passed since the letter was written, and six years before war broke out, there was ample opportunity to test whether in fact du Pont did thereafter meet the views of the Germans. A full record has been introduced about every sort of detail in the conduct of the industry here and abroad during all those years; and the Judge did not find, nor could he have found, that du Pont did in fact enter into or join the conspiracy during those thirteen years. It is surely out of all proportion that for the full history of thirteen years' experience, there should be substituted a single letter written by a third party, itself distinguished by mere expressions of wishful thinking for the future.

The whole of the Beschorman letter is open to similar comment. Thus, in the second paragraph, he says that to explain why the licenses are only non-exclusive

> "we have to refer to the United States Anti-Trust Laws which absolutely forbid the granting of exclusive license between two manufacturers in the United States as such a practice would tend to create a monopoly".

His next sentence opens with "therefore"; but it was a complete *non sequitur:*

> "Therefore, the use of this phrase 'non-exclusive license' is simply to comply with the United States Laws and in practice the licenses under each other's patents will undoubtedly prove to be, to all intents and purposes, exclusive".

We can well imagine that Rupprecht never troubled to read the Beschorman letter carefully, or that if he did, he renounced it or said something of this sort to himself: "Oh, well, what difference does it make what Beschorman said? He enclosed our letter and that states our position. We are not committed in any way by what he says".

(*Third paragraph, bottom R.* 215 *to middle R.* 216)

The Judge, in explaining why he attached such importance to the Beschorman letter, gave two reasons, *first,* that Rupprecht had asked Beschorman to persuade the Germans to consent, and *second,* that Rupprecht did not repudiate Beschorman's request.

As to the first, we do not dispute that du Pont wished the contract with National Lead to go through. That was obviously so, as it had made the contract. And the contract, a non-exclusive license, was beneficial to American competitive trade, for it enabled du Pont to enter the field in full competition with the American representative of the inter-

national cartel. Therefore, there can be no vice in the fact that du Pont did wish National Lead to procure the necessary consent.

(j) It was error of law to hold that the omission of du Pont affirmatively to repudiate the National Lead letter constituted du Pont a conspirator.

We submit that the Judge committed a clear and prejudicial error of law when he held that

> "Such quiescence on the part of DP can only be construed as ratification".[2]

[2]The fact that Rupprecht asked or, more accurately, told Beschorman that it was necessary to persuade Titangesselschaft to consent to the proposed form of agreement is, taken by itself, wholly innocuous. By so doing Rupprecht did not authorize Beschorman to convey any promises or "assurances" with respect to du Pont's future conduct. That Titangesellschaft could legitimately and lawfully have permitted du Pont to have a cross-license without any unlawful restrictions on its conduct is clear. A request to Beschorman to persuade Titangesellschaft to act lawfully cannot conceivably be itself unlawful. Therefore, the imputation of Beschorman's letter to du Pont can only rest, if at all, on du Pont's alleged "quiescence".

While the evidence does show that Rupprecht was cognizant of the letter, and there is no direct evidence that Rupprecht, on behalf of du Pont, repudiated anything that was said in the letter, to assume, as the District Judge did, that du Pont had the burden of proving repudiation, and that in the absence of direct evidence of repudiation du Pont failed to carry the burden, is erroneous, as a comparison of the facts in this case with those in the *Interstate Circuit* case, with which the Judge drew a parallel, makes evident.

In the *Interstate Circuit* case, a number of facts existed which were believed by this Court to justify the inference that the distributors acted in concert and in common agreement in imposing restrictions on their licensees in a number of Texas cities. The distributors unanimously failed to tender testimony, at their command, of any officer or agent of a distributor who knew, or was in a position to know, whether in fact an agreement had been reached among them for concerted action. Whereupon, this Court said:

A party cannot be held to have joined a conspiracy because it did not affirmatively object to a statement by a conspirator, unless it was itself *already* a conspirator or otherwise was under a duty to object. Du Pont owed no duty either to National Lead or to the Germans,—certainly none to the latter, who were complete strangers to it. And the Judge himself gave no indication of why there was any duty on the part of du Pont to correct or object to what Beschorman had chosen to write to his co-conspirators in Germany. Du Pont was not interested in the conspiracy. Du Pont

---

"When the proof supported, as we think it did, the inference of such concert, the burden rested on appellants of going forward with the evidence to explain away or contradict it. * * * The failure under the circumstances to call as witnesses those officers who did have authority to act for the distributors and who were in a position to know whether they had acted in pursuance of agreement is itself persuasive that their testimony, if given, would have been unfavorable to appellants. The production of weak evidence when strong is available can lead only to the conclusion that the strong would have been adverse. * * * Silence then becomes evidence of the most convincing character." Interstate Circuit v. U. S., 306 U. S. 208, 225-6 (1939).

In contrast, in this case, repudiation could have been done by letter, telephone call or in person, and if either of the latter two methods were employed the only persons able to testify would have been either Rupprecht himself, or Beschorman. However, Rupprecht was dead at the time of the trial and Beschorman was ill and unavailable as a witness. He has since died. Under such circumstances du Pont's failure to prove repudiation by direct evidence is not a proper ground to found an inference of acquiescence.

To the extent that it lay in du Pont's power, du Pont did prove that it did not acquiesce in any "assurances" that it would become a party to the territorial aspects of the conspiracy. Added to the fact that Rupprecht's own letter firmly refused to enter into the conspiracy, is the unimpeached testimony of Jebsen, one of the principals directly concerned in the 1933 agreement negotiations,

had "definitely" refused to participate in the conspiracy. Du Pont was interested only in the license. And the license was perfectly legitimate. It was all that du Pont received.

(k) The District Judge was greatly influenced by his own mistake of fact in attributing to du Pont a phrase used by the Germans in their reply to National Lead, but not communicated to du Pont.

At the outset in his legal analysis, the Judge made a mistake of fact which proved in the end to be very prejudicial to du Pont. In the middle of the same paragraph in which he was discussing the Beschorman letter, and immediately after his conclusion that "quiescence on the part

---

who testified most definitely and positively to the effect that Rupprecht made no oral agreement to refrain from exporting at that time (R. 2899, 3047-8), and refused to subscribe to the principles of the 1920 agreement, which, of course, included the principle of territorial restriction (R. 2956-7, 3026-7). The documents also show that du Pont considered the 1933 written cross-licence agreement to constitute the full understanding at that time (Ex. R. 1451, 1463, 1485, 1505, 1509). There is also the enormous quantity of evidence in the record covering the period subsequent to 1933 which indicates that throughout this period National Lead and its foreign associates did not consider du Pont committed to any of the principles of 1920, including the principle with respect to territorial delimitations. Finally, the present head of du Pont's titanium business, Mr. Daley, who succeeded Mr. Rupprecht, testified unequivocally that, to his knowledge, du Pont has always considered itself entitled to export or sell in Europe at any time, and this testimony stands uncontradicted (R. 1167).

Moreover, du Pont was in no event obliged to repudiate Beschorman's letter or to prove that it did so. Du Pont was interested only in obtaining rights under National Lead's patents, a lawful objective. When asked to join in the conspiracy, it repeatedly refused, and its final word, Rupprecht's letter of June 28, in answer to I. G. Farbenindustrie's demands, was unequivocal in such refusal. What National Lead chose to tell its foreign associates was its business and not du Pont's. Du Pont's only obligations were to National Lead. Although there may be cases in which one has a duty to speak and failure to do so is the legal equivalent of ratification, this is not one of them.

of DP can only be construed as ratification", he said (R. 216, line 6):

> "It follows that the assurance that 'Du Pont will loyally respect the territory of TG' which TG discovered in the communications from Rupprecht and Beschorman was an assurance which must be attributed to DP, despite the painstaking efforts on its part to sever the line of imputation. At least then as to territorial delimitations of the titanium pigment business, DP joined the combination".

The Judge was at the time that he decided the case under the mistaken impression that the very damaging phrase "Du Pont will loyally respect the territory of TG" was contained in the Rupprecht and Beschorman letters, or one of them, for he put the phrase in quotes, said that it was "discovered in the communications from Rupprecht and Beschorman", and concluded that it constituted "an assurance" that "must be attributed to DP". If du Pont gave an assurance that it would loyally respect the territory of Titangesellschaft, we agree that it would be a very serious matter. The word "loyally" would evidence membership in the conspiracy and the phrase as a whole would, as the Judge said it would, amount to "an assurance".

Now, as a matter of fact, no officer or representative of du Pont ever did write that phrase, and no officer or representative of du Pont ever saw that phrase (FF 73, R. at 288).

The nearest thing in the record to the quoted phrase occurs in a letter from the Germans [the I. G. Farbenindustrie legal department] to Dr. Jebsen, representative of Titan, Inc., dated August 7, 1933, of which a copy was sent by Jebsen to Beschorman (Ex. R. 1516), *but was never*

sent to du Pont. It appears in the record in the original German, and also in the following translation:

> "The point of view which the National Lead Co. has taken in the letter of July 12th 1933 signed by Mr. Beschorman, Vice-President, and which appears from a letter from the Krebs Pigment & Color Corporation of June 28th 1933 signed by Mr. C. H. Rupprecht, President, of which also a copy has been submitted to us, does not formally correspond with the wishes which we expressed to you in our letter of June 20th 1933. We note[8] though from these letters the assurance that National Lead Co. and Titanium Pigment Co. as well as their new American Contract Partner, the Krebs Pigment & Color Corporation, will loyally respect the delimitations as regards manufacture, granting of licenses and sale, which are fixed in the agreement between Titan Co. and Titangesellschaft. Relying on this loyal promise, we renounce on the formal confirmation of the wishes expressed in our letter of June 20th 1933 [the letter in which I. G. Farbenindustrie had asked National Lead to require du Pont to agree to the territorial and other restrictive terms of the 1933 agreement]".

It will be at once apparent that the sentence about loyalty and assurances was based on nothing more than a reading of the two documents emphasized by the Judge ("We note though from these letters * * *").

(1) What really happened in Germany, was that the Germans, in order to "go along with" National Lead, indulged in a little wishful thinking about du Pont, not supported by the terms of du Pont's letter.

If the Germans misread du Pont's letter, that surely is not evidence against du Pont, at least in the absence of

---

[8]Jebsen testified (R. 1021) that a better translation would have been "deduce".

du Pont being shown the Germans' letter. So much the better for American trade and commerce if du Pont, as it did, in fact obtained a non-exclusive license and access to the technological information of National Lead, as a result of the Germans' either misreading the letters from America, or (as is more probable) as a result of the Germans arguing themselves into such a misreading in order to save their face in withdrawing their objection.

Although we consider it all immaterial and irrelevant so far as du Pont is concerned, the fact that the Judge based his opinion upon this German communication impels us to go into the record to see what really happened in Germany. The story is told by Jebsen. On the face of his letter to National Lead enclosing the I. G. Farbenindustrie letter (Ex. R. 1513), it appears that he had seen a draft of that letter in advance and had had several telephone conversations about it, and had indeed "suggested some changes". Apparently Jebsen was involved in a selling job to win over the Germans, notwithstanding the fact that they were not getting from du Pont what they had expected to get.

Jebsen told the story fully on cross-examination both by the government and by du Pont. The gist of his story was that it was his duty as a representative of National Lead to try and get the Germans to feel happy; that the Germans in turn wanted to accommodate National Lead: that although they recognized that the relationship with du Pont was very different from the basic principles presented to them by National Lead in 1927, he prevailed on the Germans to go along in the hopes that they would later get du Pont in line. That showed that the Germans went along, not because they got what they wanted, but because on the whole they concluded that they should not break

with National Lead, and became convinced that they should go on in the hopes that du Pont would be brought into the conspiracy later. (A full review of Jebsen's evidence on this subject appears later in this Appendix.)

There is no justification, therefore, for the finding that du Pont entered the conspiracy in 1933.

And even the Judge did not hold that it entered the conspiracy later.

(m) And, regardless of what happened in Germany, it was error of law to base a decision on it against du Pont.

An additional and independent point is that, regardless of what motives moved the Germans, and regardless of what they deduced from American writings, it was error on the Judge's part to found a decision against du Pont on the basis of what the Germans did or thought, as evidenced in a communication that was never even shown to du Pont (FF 73, R. at 288).

(*Paragraph at middle R.* 216)

That the Judge did erect his structure upon this error appears in the next paragraph of the opinion, in which he draws his inferences. Immediately after his citation of the *Masonite* case, the Judge was forced to recognize:

> "It may well be, and I take it as a fact, that in giving the assurance not to manufacture in or sell in TG's territory, *DP was not making a promise;* * * *."

The Court will observe that this was on the *assumption* that du Pont had given such an assurance, which assumption itself was unsupported, as we have just seen.

(n) Indeed, the District Judge expressly held that du Pont did no more than give expression to its then [1933] business policy not to export to Europe.

The Judge held that the assurance that he mistakenly supposed that du Pont had given did not itself amount to a promise:

> "it was doing no more than giving expression to its then existing business policy not to manufacture or sell in Germany and other TG territory; and it may well be that in any event DP could not successfully compete in Germany."

Here we have the Judge's definite finding: That du Pont, at its maximum, was ("no more than") "giving expression to its then existing business policy not to manufacture or sell in Germany and other TG territory". The Judge's later statement that du Pont *might have* competed in other territories adds no more to this.

(*Bottom R.* 216)

The Judge next said:

> "Legally, it [the defense that du Pont was only stating its existing business policy] is insufficient,
>
> because concerted abstinence from commerce is proscribed even where there are valid unilateral reasons for abstaining; and also
>
> because DP's assurance, in part, formed the consideration for the continued abstinence of the European producers from exporting to the United States".

There is no basis for the Judge's insertion of the word "concerted" in the first sub-paragraph, since du Pont made a unilateral statement of its existing business policy, a

policy which we have seen found strong support from economic and business factors which prevailed. As to the second sub-paragraph, the Judge's conception that the du Pont statement of present intention had some sort of decisive effect in Europe was expanded upon in the next succeeding paragraph of the opinion, and provided the only ground upon which the Judge based any finding that the *effect* of what happened in 1933 was actually to constrain trade in any way.

(o) A statement thus innocent in itself does not become unlawful because people abroad, unknown to the maker of the statement, proceed to act upon a misconstruction of it.

(*First paragraph, R. 217 at line 3*)

The Judge suggested that "In a very important way, DP's assurance closed the breach which was in the making in the wall built around the titanium business by NL and its foreign associates. It also removed the last obstacle to the establishment of a commercial collaboration between the Titan group and the Blumenfeld companies".

Even if it were true that the effect of what du Pont did was that the Titan group and the Blumenfeld group were brought together, and that some breach between them was healed, that would be no ground for a decision against du Pont. It has been universally held by this Court that it is not every "effect" that causes liability under the anti-trust laws, but only every "necessary" effect, the reason being that it is essential to show illegal purpose on the part of the defendant, and that such purpose may be inferred if the conduct under review had a *necessary* effect. The District Judge, in misapplying this established rule of law, overlooked his own wise dictum that *"Post hoc, propter hoc*, is

an invalid argument whether used by the plaintiff or the defendant" (R. 208).

The only legitimate inquiry should have been whether the two documents which the Judge was considering would have the necessary effect of healing a breach between two European groups and bringing them together under a single combination. No such finding could possibly have been made, as there was no reason for Ruppprecht to have foreseen such an unconnected result (assuming it to have occurred, which we deny) of the two documents in question. The inquiry, therefore, whether that did happen as an effect of the two documents, ought never to have been entered upon by the District Judge.

(p) And the statement did not in fact have the effect that the District Judge imputed to it (elimination by agreement of competition between the two groups inside of Europe).

Assuming for the purpose of the argument that it was legitimate to enter upon the inquiry as to what happened in Europe, there is no support in the record for a finding that what du Pont did or did not do in 1933 had the effect of bringing the two European groups together. The history of their negotiations over the years before and after 1933 is fully set out in the record, and the references to du Pont are but incidental and are generally to the effect that it is too bad that du Pont refuses to cooperate and that an effort should be made to bring it into line. This was as true of 1933 as of the later years.

The documentary history of the European cartel has been reviewed under the Statement of the Facts, *supra*. We need here refer only to a single document; and this Court's particular attention is respectfully called to the dates involved. Ex. 266 (Ex. R. 1474) was a letter from Jebsen

to Beschorman dated June 23, 1933, with annexed copies of a letter from I. G. Farbenindustrie to Jebsen and of a cable from Jebsen to Beschorman. The I. G. Farbenindustrie letter (dated June 20) and the cable (dated June 22) are important in another connection, in that they set forth the conditions which I. G. Farbenindustrie was proposing that National Lead must impose upon du Pont before consenting to the 1933 agreement. This was the letter and cable to which the document relied upon by the Judge, the Beschorman letter of July 12 (Ex. R. 1491), enclosing the Rupprecht letter of June 28 (Ex. R. 1483), was the reply. Nothing that happened before those letters were sent could have been the result of them.

Ex. 266 gives a detailed description of a meeting at Frankfurt on June 19 between Jebsen, the I. G. Farbenindustrie officials and the representatives of the company "Aussig", of Czechoslovakia, which was the Central European company of the Blumenfeld group that threatened competition to I. G. Farbenindustrie. It was this threatened competition that is described by the Judge in his opinion as constituting a "breach which was in the making in the wall built around the titanium business by NL and its foreign associates", the healing of which he charged to "DP's assurance". Ex. 266 is decisive in showing that the Judge was chronologically in error. The exhibit, after naming all of the people present at the meeting of June 19, proceeded (Ex. R. 1474):

> "The agreement between Aussig and Titangesellschaft was discussed and the main points agreed upon,—details to be worked out by Mr. Schaeffler and Mr. Borgwardt" [subordinates of Aussig and I. G. Farbenindustrie attending the meeting].

[Evidently the Aussig people at that point left the meeting, the main points of their agreement having been settled, and whatever breach there was between I. G. Farbenindustrie and its Blumenfeld competitor having thereby been healed.]

"*Afterwards* the same gentlemen from IG discussed with me the draft agreement Titanium Pigment Co./Krebs".

This destroys the Judge's theory that it was the so-called "DP assurance" which accomplished the "commercial collaboration" between the Titan group and the Blumenfeld companies. Elimination of this point removes from the Judge's opinion any *effect* of du Pont's alleged "assurance", even assuming that there had been such an assurance.

Ex. 266, convincing though it is, does not stand alone. There is ample evidence in the record that the Titan-I. G. Farbenindustrie group and the Blumenfeld-Aussig group were always determined to work together, in accordance with the cartel system which was nearly universal in Europe in those years. The European groups were not waiting for du Pont, or anyone else in America, to assure them that they were not proposing to export or to do anything else from America. If they had been waiting, they would have been far more likely to effect a "commercial combination" among themselves if they had been told that du Pont was going to export, as they would then have needed to combine their forces to meet the threat.

(q) If the du Pont statement could have been anticipated to have any effect in Europe, it would have been just the opposite.

If the statement by du Pont that it was not then its intention to export would have had any *necessary effect* upon the

Europeans' action, it would have been to reassure them that they could afford to remain independent of each other, because not needing to close their ranks in order to meet a common enemy from America.

The Europeans did not, therefore, close their ranks because of threat of competition or otherwise. They closed their ranks for European purposes, regardless of America, as reflected in the many exhibits showing their meetings among themselves. See Statement of the Facts, *supra*.

(r) The District Judge drew the same inference from the oral testimony as from the documents—no promise by du Pont, only an explanation of du Pont's already existing policy.

(*Middle R.* 217)

Before concluding this paragraph, the Judge referred to conversations between Rupprecht and Blumenfeld. There were only two such conversations, the first in 1931, and the only one of any conceivable importance being in July of 1933. Blumenfeld was produced by the government as its principal witness. It was quite obvious that he was trying to please the government.

Although we think that no reliance whatsoever can be placed upon Blumenfeld's testimony, we do not really need to go further than to accept the Judge's own evaluation of it, which is shown in the first few lines of the concluding sentence of the paragraph under consideration:

> "From the somewhat conflicting testimony as to the nature of Rupprecht's conversations with Blumenfeld, I conclude that Rupprecht made no promise; but that he did explain to Blumenfeld DP's policy with respect to the European market".

to which the Judge once again tacked on the same adverse inference as to du Pont policy which we have shown had no support in the record,

> "a policy made unilaterally in many respects, but undoubtedly strengthened and territorially extended as a result of the assurances to NL".

Here the Judge was merely returning to his main theme, and was emphasizing by repetition his findings that

(1) Du Pont's representative made no promise; but

(2) He did explain du Pont's existing policy with respect to the European market.

(s) Du Pont had "valid unilateral reasons"—thus described by the District Judge—"for abstaining" from the fruitless effort to invade the European market of 1933.

We have seen that du Pont had its own reasons for its decision as of 1933 not to seek to enter the European market (had, as the Judge himself recognized, "valid unilateral reasons for abstaining", "a policy made unilaterally in many respects"). That the Judge did not recognize that du Pont's own business decision was the sole cause, is again shown by these quotations to have arisen out of his mistake of fact in thinking that there was evidence that du Pont gave some "assurance" to the contrary. As we have shown, and as appeared in detail on the review of the evidence in our Statement of the Facts, it is just not the fact that du Pont ever gave any "assurance". Indeed, a curious thing is that the Judge himself had so decided when, a little earlier in the opinion, he had held "as a fact" that in doing what he called "giving assurance" du Pont was doing "no more than giving expression to its then existing business policy not to manufacture or sell in Germany and other TG territory".

It thus appears, not from a single quotation, but from a repetition in different forms of precisely the same ideas, what the Judge's mental process was. Again and again he was making very strong findings in favor of du Pont, both that all it did was to explain to the Europeans that in truth and in fact in 1933 it did not have a policy of exporting to Europe, and that in truth and in fact that policy was its own unilateral policy. But he was then shading those conclusions by suggesting that these statements constitute some sort of "assurance", and from the shading he was drawing inferences about "concerted abstinence from commerce" and consequent "consideration for the continued abstinence of the European producers from exporting to the United States". But these unfavorable inferences find no support except in the single erroneous belief that there had been an "assurance" that "du Pont will loyally respect the territory of TG" and, as we have seen, that is traceable only to a letter from Titangesellschaft itself, which was addressed to another member of the conspiracy and was never even shown to du Pont.

It becomes increasingly apparent how du Pont became the victim of the dangerous technique of a modern conspiracy trial. The government was free to introduce a mass of evidence consisting of communications between the various members of the cartel. One of these communications was the German letter in question. When thinking about du Pont, the Judge's mind was colored by that communication. As it were, his mind was poisoned at the source by the government. The consequence was that, although he recognized, and repeatedly recognized, that du Pont was only stating a fact and not making a promise, and that that fact was one reached by du Pont's independent and "unilateral" decision, the poison remained.

Du Pont has been held, not for what it either did or said or decided, but because of some misconstruction put by some German on what had been communicated to the Germans by National Lead about du Pont.

(t) The evidence was unequivocal that the Europeans remained discontented with du Pont's position, and that du Pont never changed it (from 1933 on).

(*Second paragraph, R.* 217)

The next paragraph of the opinion is that in which the Judge deals with what happened subsequently to 1933. Our submission is that the straightforward way to deal with this is to recognize that events subsequent to 1933 confirmed that du Pont had not in fact joined the conspiracy. The Judge's language does indeed seem to indicate that he accepted that submission; but again his acceptance is a grudging one. The most reasonable and consecutive history of the 1933 events was that given by Jebsen. Here is what the Judge said of it:

> "This description of DP's position in 1933 is consistent with subsequent developments. To Jebsen, devotee of the precise covenant, advocate and practitioner of clarity and definition in language and obligation, such vague and Janus-faced language [as Rupprecht's] was a source of disquiet and apprehension".

Here the Judge is telling us that the principal architect of the conspiracy had "disquiet and apprehension" about du Pont's position; that Jebsen found no satisfaction in Rupprecht's language. Why the Judge should describe Rupprecht's language as "vague and Janus-faced" would be inexplicable, in the face of the Judge's own repeated state-

ment that it was "no more than giving expression to its [du Pont's] then existing business policy", were it not for the continued working of the poison (the misconception that du Pont had given some "assurance" about "loyally", respecting the territory, etc.); but if Jebsen had heard from du Pont itself an assurance of loyalty, how could he possibly be in the mood which the Judge describes in the next ensuing sentence of the opinion:

"But he [Jebsen] hoped for the best"?

If Jebsen had an "assurance" of "loyalty" from du Pont, he would not have been compelled only to "hope". Indeed, the Judge himself said that Jebsen "appraised DP as an organization that would not repudiate an unwritten obligation". An "assurance" from that organization would have given rise to more than "hope". The reason that there was only "hope" was that there was *no* "unwritten [or other] obligation". We respectfully submit, with great respect to the learned Judge, that in these sentences he has conclusively revealed his own misinterpretation of the facts.

The Judge himself had held that du Pont made no "promise" or "agreement". How then could it have an "obligation"? That the Judge said it had, is useful only as showing how the Judge's mind leaped ahead to some inference against du Pont, inconsistent with his own reference to Jebsen's mere "hope". But the Judge did not need to resort to inference, for Jebsen testified at length, and was cross-examined by the government. Moreover, voluminous contemporaneous writings by him are in evidence. Far from showing that he considered that du Pont had assumed an unwritten obligation, they show his constant concern because of the fact that du Pont had *not* assumed any.

(u) Jebsen, the principal architect of the conspiracy and principal witness in the case, explained that he never had more than a "hope" that du Pont might be induced to join, and that he never succeeded in bringing it into, the conspiracy.

The Judge described Jebsen (R. 217) as

> "devotee of the precise covenant, advocate and practitioner of clarity and definition in language and obligation".

The Judge said this after both hearing Jebsen on the witness stand, and after reading about 200 exhibits written by Jebsen and covering more than 750 pages of the record, all introduced by the government itself. It must be taken, therefore, that what Jebsen said was the truth and that the government was bound by what he said; indeed, no one was better qualified than he, as he had been the principal activating figure in the whole business from his original inventions thirty years ago right down to the present. Unlike Blumenfeld, who was an old man speaking poor English, Jebsen appeared on the witness stand as a vigorous figure, speaking clear English, as indeed he had written it over the thirty preceding years ("advocate and practitioner of clarity and definition"). Jebsen made repeated trips between Europe and America throughout the period, and he saw Rupprecht both in 1933 and 1938 in an effort to bring du Pont into the cartel. No one was better qualified than he to answer the ultimate question: Whether du Pont became a member of the cartel.

Taking up at once the situation in 1933, Jebsen first foresaw with perfect accuracy what the I. G. Farbenindustrie was going to say about the proposed non-exclusive cross-licensing agreement between du Pont and National Lead, viz. that du Pont must agree to the cartel principles

of the Contract of 1920. He wrote to Thompson of National Lead two letters to this effect on March 1, 1933 (Ex. R. 1430 and 1436). He then met with the I. G. Farbenindustrie people and had his views confirmed (Ex. R. 1474-1475), and cabled the confirmation (Ex. R. 1482). He then traveled to America for the purpose of attempting to convince du Pont.

We here set up Mr. Jebsen's testimony on the subject, in narrative form. Where phrases are repetitious, we eliminate the repetition, but are satisfied that we are following closely the substance of what was said and using Jebsen's own phraseology:

Under examination by Mr. Webster for National Lead (R. 961-2):

> "Mr. Rupprecht did not, either in 1933 or ever, accept the provisions of Article XIV of the 1920 agreement. I never got him. He was too slippery for that, quite frankly".

Under examination by the Court (R. 962):

> "The substance of my conversation with Mr. Rupprecht in 1933 is more or less expressed in this letter he wrote [Ex. R. 1483]. He said that, after all, we haven't exported to these countries, you are protected by patents in these countries; how can we export? And I think the whole thing will work out to be eminently satisfactory to you. He talked about the non-exclusive license, which I didn't like at all and which I couldn't see the reason for. He said that it was a rule from the executive committee or finance committee [of du Pont] not to part with any property entirely; he would have to put it up to the executive committee, and he thought that the approval would not be given. He used that execu-

> tive committee as something which he could not work up against. Frankly, I thought National Lead should not accept the treatment of that kind. But, nevertheless, at the same time he said it would work out satisfactorily. Beschorman [of National Lead] expected a certain amount of advantage in getting technical information and engineering service and so on from the du Pont Company. I think he and Thompson [of National Lead] were rather fascinated by the big du Pont Company and so on, which I think I wasn't quite so impressed with. But, finally, after all, I was an employee of the National Lead Company, and found that I would have to help the matter along and be a good soldier."

In other words, du Pont refused to do more than (1) exchange a non-exclusive license and (2) state that it had not been engaged in export business; and not being licensed therefor, how could it be? Jebsen was dissatisfied, thought du Pont's arguments against joining the cartel unconvincing, and thought National Lead ought to stand up to du Pont. But unable to convince National Lead, Jebsen had to accept du Pont's refusal. Under cross-examination by Mr. Dixon for the government, and by the Court, Jebsen did not change his evidence. He only made it more precise (R. 993-5):

> "This July meeting was the first time I had met Mr. Rupprecht. I was trying to get Beschorman to get Rupprecht to see the difficulties we were encountering with regard to the IG. I wanted to persuade Rupprecht to go along on the territorial arrangement and on the technical exchange [with the Europeans], and to get as far as I could to accept the 1920 agreement. He [Mr. Rupprecht] had too many answers in one way. One moment he talked

about the executive committee, they would not accept that kind of thing. At another moment, he said, 'You are secured against any invasion from us through your patents', and so on. At the third time, he said, 'For legal reasons'. Now, with regard to legal reasons, I couldn't take that serious. With regard to the other things, I found it very difficult to take those serious too; but at the same time my impression was that he had a desire of trying to accommodate us and he was trying to paint a picture in that direction, that there wasn't anything to be feared. But I didn't get, what I would say, down from sound to things, to get down to some definite understanding. So, to me of course the question was, in sending these letters back to the Germans, what shall I say? I felt on the one side I had to be a good soldier, and at the same time I thought this may work out all right when the time comes. So I just wrote a few words to the Germans trying to convey that opinion. I only had the one conversation with Mr. Rupprecht. It may have been an hour, it may have been two hours; I can't say. I was not satisfied by what Mr. Rupprecht said. I did not feel happy about the thing. I was satisfied to the extent that he had been able to sell himself to the extent that I believed that there might work out something as he called eminently satisfactory. I was hoping that as time developed I might be able to get him to understand and sooner or later fall in line. It was a matter to me of further development. I felt I was lost practically at that time."

Under cross-examination by Mr. Dixon for the government (R. 996):

"Q. Were you satisfied when you left the meeting with respect to the action of Krebs in respecting

the territorial limits of the Titan companies?—A. I was hoping——".

Under cross-examination by Mr. Dixon for the government (R. 998):

> "I was endeavoring to get Mr. Rupprecht to understand the principles of the 1920 agreement. He was always very evasive. I was not satisfied that he understood".

Under examination by the Court (R. 1004-6):

> "My general impression from that time was that I was very dissatisfied really with the situation as it was. I had to act as a good soldier. And I was trying to convey the situation to the Germans with the idea of being neutral or of being diffident. * * * If you look back at it, I felt at that time, I felt that I was in a very difficult position, and I felt that on one side my personal interest was not very much of doing this thing; on the other side, National Lead wanted to have this thing through, so my intention was to put the responsibility on Beschorman and National Lead as much as possible".

Under cross-examination by Mr. Dixon for the government (R. 1021-2):

> "If there had been any oral understanding—some explicit discussion between Rupprecht and myself in that meeting with Beschorman, I think it would have been natural for me to go to the Germans and explain that. Whereas I didn't pay any visit to Germany at all. In other words, I left the weight of the thing on the correspondence as it was".

Under cross-examination by Mr. Whitney for du Pont (R. 1027):

> "I have never discussed my testimony with you or with any other representative of du Pont whatsoever".

(At R. 1030, *et seq*);

> "I did not take seriously what Mr. Rupprecht said about legal reasons, because, after all, when a man puts forward three or four different things and they are contrary to what was arranged between the National Lead Company and the European companies, because after all they had been accepted over here [in America], you could not ask me to take it serious. In other words, I had understood that the 1920 structure was legal under American law and therefore when Mr. Rupprecht gave me that reason I thought that he was trying to put forward an excuse to stop me. I found it very difficult to take seriously too the other explanation with reference to the Executive Committee. Where the patent protection was concerned, I could use my own judgment, but when you come to the Executive Committee, that seemed to me to be just an excuse. I thought that the thing was important enough to get the Executive Committee to accept the matter. I thought it was a very highhanded way and I think I even wrote Mr. Beschorman at one time too about this Executive Committee and about the manner Rupprecht dealt with these matters; that the negotiations ought to be with the Executive Committee then if there were higher interests which we could not touch. I felt reassured to some extent, with some doubt, to be quite frank, at the same time. I mean I could not say I was entirely relieved. There was a certain vibration in my mind, so to say. I was not

entirely happy about it but I thought we would have to take a chance.

"I think you will note from various of this correspondence that I steadily came back and tried to get Rupprecht in line and did not get him in line. He was trying to be friendly and re-assuring, to relieve my mind, and I was trying to get him down from sound to things, down to a matter of fact instead of talking. The impression that I sought to convey to the Germans was the impression of we should take the chance. But I did not feel happy about the thing. My duty to National Lead made me feel that I ought to do what I could to make the Germans give their approval to sign this agreement. I would like to take a neutral attitude as to how they should feel about it. As a business man, as a representative of the National Lead Company, of course it was my duty to try to get them to feel happy, but at the same time I did not want to take more responsibility than absolutely necessary. I did not feel that it was my duty to give them a precise analysis of what I really thought. I left that to them, and personally I think they knew what they did when they wrote back their letter. Their position was, as far as I understand, always, without having talked with them, but I am just reasoning, but from my talk in Frankfurt before I went over, that they wanted to accommodate the National Lead Company.

"I felt uncertain about the future. I had not got as clear a basis as it was desirable to have vis-a-vis the Germans and vis-a-vis the whole thing. I wanted to get du Pont down to the 1920 agreement but I could not get them. Mr. Rupprecht was slippery and elusive and left me in doubt. I was hoping that as time developed I might be able to get him to understand and sooner or later fall in line. The

hope was that I might have to further develop the opportunity to get Rupprecht to accept the sound principles. I was not reassured; I was lost at that time. I was doubtful, but hoping. My general impression from that time was that I was very dissatisfied really with the situation as it was.

"The position was difficult for me. After all, we were asking the Germans to accept the position or relationship with du Pont which was very different from the relations we had, the basic principles that we had presented to them in 1927. It put me in the necessity of trying, in effect, to get the Germans to accept something which I did not like. At the same time I thought we should take the chance. We had not gotten down from sound to things—the thing was too indefinite in certain respects, if you understand what I mean. If it had been left to me to decide what National Lead should do, I would not have made that agreement—I mean the agreement of 1933.

"I was still in hope and planning for future developments. To put it more explicit, hoping that as years went on, as one got to know each other better we will get the du Pont Company in line."

We submit that the line of answers was remarkably consistent, whether to the Court, government counsel or to du Pont counsel, and that Jebsen was saying this:

(1) Du Pont's agreement was so inconsistent with the principles of the cartel that I would not have made it myself.

(2) I tried to convince Rupprecht to adhere to the principles of the cartel, but he was slippery and evasive, and refused to agree.

(3) Rupprecht gave me two reasons why he would not agree. First, he said that the Executive Committee of du Pont would approve only a non-exclusive license. Second, he said that he was prevented by the anti-trust laws. I was not satisfied with either reason. As to the Executive Committee, I thought that National Lead ought to be entitled to speak directly to the du Pont Executive Committee in order to convert them to the principles of the cartel. As to the anti-trust laws, I thought Rupprecht must be wrong, as I had been told by National Lead that the whole 1920 cartel set-up was legal under American law. Therefore, I thought that Rupprecht was only making excuses.

(4) Rupprecht did say that his Company had not exported to Europe, and asked "how could it?" as it was not licensed under the patents in Europe. But he would not make any promise or agreement, and I was not satisfied.

(5) Rupprecht was trying to be polite and reassuring in manner ("sound", not "things", i.e. "talk", not agreement). I felt that as far as accomplishment was concerned, I was lost.

(6) I was prepared to go on hoping that at some time in the future I would have an opportunity to develop the matter further and get du Pont into line.

(7) I was, therefore, very embarrassed in communicating with the Germans, as I knew that from their point of view they ought not to be satisfied, but it was my duty, as an employee of National Lead and as a good soldier, to try to bring them around.

(8) I think that the real reason that the Germans consented was not that they were convinced, but that, just like me, they wished to accommodate National Lead, and were willing to go on hoping that as time developed du Pont might be brought into line, although in 1933 we were failing to bring them into line.

(9) In subsequent years, I steadily came back and tried to get Rupprecht into line, and I did not get him into line.

If these be the right conclusions to draw from the Jebsen testimony, the Judge made an erroneous decision in this case, and the decision must be reversed on the merits.

It is, of course, universally admitted that du Pont never thereafter was brought into line.

(v) And after 1933 repeated efforts to bring du Pont into line only resulted in failure. It remained outside the conspiracy.

We need not here recount all of the references in the Jebsen correspondence after 1933 to the fact that du Pont was not in line and ought to be brought into line. One or two examples will suffice. The Court will find a full brief of Jebsen's complaints against du Pont, addressed by him to Beschorman under date of January 4, 1935 (Ex. R. 2953). The letter opens with a lecture on the avoidance of competition, that commercial competition is avoidable by dividing markets and technical competition by application of the principle of exclusivity. Jebsen points out that these are the principles that govern "our agreements", and from which the du Pont agreement radically deviates. "At present", Jebsen argues, "we have a better opportunity than at any other time to bring Krebs to our views because

of their infringement of Titan Co.'s patents". Our aims should be to "get the relations with Krebs as far as possible in line with the ideas and conditions laid down in article XIV of the license agreement of 1920". There follows an explanation of why Jebsen cannot believe that the anti-trust laws are an obstacle, for if so "both your and our lawyers would then have been wrong in 1920 in forming Article XIV". Complaint is also made about the du Pont rule against giving up manufacturing rights in any country and granting exclusive licenses, and once again it is suggested that there should be a direct assault upon "Dupont's financial committee". The letter recognizes that, as a practical matter, du Pont cannot compete in Europe: "Personally I am inclined, as far as Europe is concerned, to agree with Mr. Rupprecht that there is no possibility of the reservation [of a non-exclusive license by du Pont] becoming of practical importance, but why then make it? It seems high-handed". Jebsen points out the opportunity to du Pont: "If the agreement provides satisfactorily for no competition between the parties, I think our companies will be inclined to a cooperation as full and open as possible in the same lines as we have between our companies".

This letter was followed immediately after by another of similar tenor (Ex. R. 2961), to say that the Germans were in agreement that they would "welcome an arrangement by which Krebs 'enter into the family by whole-hearted cooperation' ".

Surely it is difficult to sustain the decision below that all the time that these letters were being written, du Pont had already become a member of the "combination or conspiracy".

Similar expressions will be found in Jebsen's letters in each of the ensuing years. But 1938 brought matters rather to a head, as Jebsen was in that year beginning his second effort to argue to Rupprecht directly. His assault opened with letters to the National Lead official who had been designated to handle patent matters (Mr. Kaegebehn) and of these a letter to Kaegebehn of February 2, 1938 (Ex. R. 3029), is a fair sample. Complaining that "The existing agreement between National Lead Company and Du Pont is a deviation from the 1920 agreement and, as you say, inconsistent with the principles laid down in this", it commences with a statement of the procedure by which the effort should be made to bring du Pont into line. A few weeks later, Jebsen was on March 8, 1938, writing to a senior officer of National Lead (Mr. Garesche) along the same lines (Ex. R. 2543). Referring to "the Du Pont's agreements' inconsistency with the agreements of the National Lead group", and using as a contrast the agreements with Canada, and as supporting argument that once again the Germans have now brought the matter up, Jebsen complains that du Pont may possibly get access to group knowledge through some cross-licensing agreement with the Canadian company, and argues that either a precaution should be taken to limit the Canadian company in any information that it might pass on, or "By a revision of the arrangement with Du Pont bringing this company wholeheartedly into the family. I hope this last will come off".

Again, we ask, how could this correspondence possibly have existed, if the Judge had been right in holding that du Pont became a member of the combination in 1933?

Jebsen then came to America in 1938 to make the effort. There are several long memoranda in the record, prepared

by Jebsen and Kaegebehn, showing what they hoped to pin du Pont down to. Some suggestion was made at the trial that they obtained du Pont's agreement to their wishes, and that du Pont repudiated them after the meeting. We think the suggestion unfounded and that there is no evidence that Rupprecht ever agreed to them even temporarily. In any event, all parties agree, as the Judge agreed, that if du Pont (through Rupprecht) ever did agree to the proposals, it certainly repudiated them immediately after the meeting. The story is best told in Jebsen's own words on the witness stand (R. 1039-1041), which we give here in the same style as the former quotations from Jebsen's testimony:

> "I came over to America in the summer of 1938. I certainly was very dissatisfied with the development of the relations with du Pont. I arranged to make a trip to Wilmington with Mr. Kaegebehn to see Mr. Rupprecht and Mr. Hancock. After I went to lunch with Dr. Sparre, a high official of du Pont and the head of its development department. The talk was more or less repetition of what du Pont said several times. You never got to the grip of things. I had one object particularly in mind and that was the following:
>
> "During the years that had passed when we negotiated these license agreements it was a very tedious thing for me. I wanted some kind of an understanding or agreement on a standard form for license agreements if and when such were to be exchanged. * * * Naturally at the same time I discussed the matter in general again, as I had done before, trying again to get Rupprecht into line, because he had never been in line,—and there was the same kind of evasions. If I remember right when I left I thought we had got Rupprecht and

Hancock to accept this idea of trying to standardize this license agreement form if and when we agreed upon licenses, but I think the following correspondence did not bear that out—as usual with Rupprecht.

"Then we had lunch. We did not talk business during the lunch, but leaving, and going down the elevator, there is one thing which I remember very distinctly because it shocked me. It gave me a little sho(ck), so to say. I said to Dr. Sparre in the elevator that what I am aiming at, Dr. Sparre, is to get as close cooperation as possible between du Pont and our companies, and he said, 'Not too close, Dr. Jebsen; not too close'. And I was puzzled somewhat at the same time about it. But that was all, and I left to take the train. I have never seen Sparre since then."

Mr. Dixon for the government went into the subject on re-direct examination, but only to bring out that, in fact, du Pont did not export during the years in question. He made no attempt to check the testimony of Jebsen, which stands uncontradicted, that he never succeeded in bringing du Pont into line with the "principles", which was his word to describe what our laws describe as the "illegal combination and conspiracy".

If the Judge had thought it important to make any reference to the five individual license agreements between Titan, Inc. and du Pont (Ex. R. 406, 412, 455, 470, 486), executed in the successive years 1937-41, this would perhaps have been the place to have done so. He evidently did not think them important; nor do we. The only point upon which we differ with his view of them is that he found as a fact (FF 88 and 89, R. 300-301) that although they were executed in five different years and related to different spe-

cific individual patents, they were all executed pursuant to a single oral agreement that that would be the practice. There is no evidence to support that finding, and we think that it cannot stand in the face of the only evidence on the subject, to-wit: (1) documentary evidence of the separate individual annual reports on the subject by Rupprecht on behalf of the pigments department to the Executive Committee of du Pont (Ex. R. 4220, 3043, 4224, 4231, 4238), which show on their face that each was independently considered and that there was no connection between them, and (2) the oral testimony of Jebsen, who was explicit in his statement that he did wish for one general agreement but that he was unable to obtain that result. The significance of the point is only that du Pont, as usual wishing to confine its agreements to specific patent subject-matter, and not to have any general understandings with the cartel, was insisting that each license be considered on its individual merits. Jebsen's testimony is as follows (R. 1040-1041):

> "I had one object particularly in mind and that was the following: During the years that had passed when we negotiated these license agreements it was a very tedious thing for me. Things were negotiated with Kaegebehn over here and everytime Mr. Hancock or somebody down there,—he wanted to change some of those agreements and Kaegebehn wrote over to me if he was not able to talk Hancock out of it, and I was not in a position to say 'yes' or 'no.' I had to go back to the Germans and the English, in view of the 1920 agreement. It made the whole thing a very tiresome process, and what I wanted was to get some kind of an understanding or agreement on a standard form for license agreements if and when such were to be exchanged, to make it clear to Rupprecht and Hancock we could

not go on with this eternal and tedious correspondence about these matters, and I wanted to have left that clearly into their minds. Naturally at the same time I discussed the matter in general again, as I had done before, trying to enforce the principles, or rather to get them—enforce is not the right word—but to try to get Rupprecht into line again—not again, because he had never been in line.

"Q. You mean try again? A. Yes, try again to get him in line and there was that same—in other words the same kind of evasions. If I remember right when I left I thought we had got Rupprecht and Hancock to accept this idea of trying to standardize this license agreement form if and when we agreed upon licenses, but I think the following correspondence did not bear that out—as usual with Rupprecht."

The documentary evidence shows the independent reasons that motivated the Executive Committee of du Pont in approving these agreements. In substance, they were that du Pont was enabled to maintain its European patents at the expense of the foreign companies while retaining a nonexclusive right in the foreign countries for itself, and indeed in three of the years while obtaining additional nonexclusive rights under United States patents. These last were found by the District Court to have been "of significance to DP's operations" (FF 90, R. at 302).

The reason that we think that all are agreed that these contracts are not of outstanding importance is of course that, under the troubled conditions that prevailed in Europe and Japan in the years 1937-41, and in the light of the cast-iron nature of the monopolistic position of the members of the cartel in their respective European countries and in Japan in those years, there was obviously no other

way of economically maintaining any patent right in those countries than to grant a license to the local cartel member, reserving a non-exclusive right in the grantor. The government argued at the trial that du Pont did not really expect to use this reserved right. Doubtless, this was true; but it was true not because du Pont was joining the cartel, but because it was economically impossible to consider an invasion into European markets in those years. Du Pont did all that it could do; it did reserve the right.

(*Bottom R.* 217)

Nothing is added by the next comments by the Judge:

> "Rupprecht, on the other hand, found the business of practicing one code, and writing another, rather strenuous and emotionally confusing. No wonder that communication between DP and NL became somewhat difficult; and, at times, NL's and Tinc's representatives left a conference with very different impressions of what had been agreed to from those entertained by Mr. Rupprecht."

Separating in these sentences the statements of fact from the Judge's characterizations, they amount to this: That Rupprecht did not agree with National Lead and Titan, Inc. as to what, if anything, had been agreed to, and that communication between National Lead and du Pont was "somewhat difficult." These in themselves are certainly not statements binding du Pont to National Lead as a member of the cartel and conspiracy. As a matter of fact, however, they are definitely misleading in that they suggest that there was frequent communication, albeit difficult, and that there were frequent conferences, albeit not resulting

in agreement, and that Rupprecht was practicing some code, albeit differing from his writings. The evidence supports none of these three assumptions.

There was only one important conference (the one in 1938), and that resulted in an unequivocal statement by Rupprecht that du Pont was not bound even to exchange technical information with the Europeans and would not do so.

(w) The records of the Executive Committee governing du Pont were introduced in evidence. None showed any commitment to the conspiracy. All showed a preoccupation only with licenses under patents.

(First paragraph, R. 218)

The Judge next turned to the point that we consider a very important one, viz., that although the record contained voluminous extracts from detailed statements placed before the governing Executive Committee of du Pont, none of it supported any theory of conspiracy. All of it related to patents and licenses under patents. The Judge handled this evidence in the following paragraph:

> "The point is made in behalf of DP that there is no evidence that its Executive Committee knew of Rupprecht's commitments. It is true that no direct evidence of such knowledge is in the record; and I need not trouble to decide whether the circumstances warrant an inference of knowledge. There is abundant evidence that Rupprecht's authority was broad enough to justify charging the corporation with his acts in its behalf."

Once again, the Judge is continuing the argument based on the *assumption* that Rupprecht had made some sort of commitments, and committed some sort of "acts". But an ar-

gument is no stronger than its factual base. And all of this is being evolved in the teeth of the Judge's own basic finding of what Rupprecht's commitments and acts really were, to-wit, that he had made no promise or agreement at all, but had merely made a statement of du Pont's existing policy in 1933 ("no more than giving expression to its then existing policy not to manufacture or sell in Germany and other T. G. territory"). The Judge's recurrence here to the word "commitments" must be put down to his original error of fact in having attributed to Rupprecht what the Judge had called "the assurance that du Pont will loyally respect the territory of T. G.", which we have seen to be derived only from a German document never shown to Rupprecht.

As to the Executive Committee of du Pont, there was ample evidence in the record that this was a governing body of du Pont, that it met every week and that all commitments of du Pont had to be specifically approved by it upon the basis of written reports made to it (see e.g. Ex. R. 961, 965, 967, 971, 986, 1048, 1060, 1072, 1083, 1114, 1118, 1201). All of the written reports to the Executive Committee relating to titanium were put into evidence, and they cover more than 100 pages of the record. The Judge was constrained, with this great amount of evidence before him, to recognize that there was

> "no direct evidence of such knowledge [by the Executive Committee] in the record".

We suggest that the Judge was not warranted in inserting the invidious word "direct" to clarify his finding of "no evidence", and was clearly not warranted in suggesting that it was even open to inquiry as to "whether the circumstances warrant an inference of knowledge". This

sort of judicial approach is proper in a case in which the parties have not put before the Court any substantial evidence of what went on at meetings. In this case, all of the records of du Pont were opened to the government investigators, and then either the government attorneys or du Pont did in fact put into the record all of the records of the Executive Committee; and they were full and detailed. In such a case, we submit, the duty of the District Judge is to make his findings on the assumption that the full record before him is a true and complete one. He has no right to speculate that there may have been some other wrong-doing. The government has the burden of proof, in equity as well as in criminal law, and our legal system does not permit a judge to suspect a fire where he admits that there is no smoke.

The fact that the Judge did indulge in such surmise and suspicion in this case is traceable not to any prejudice on his part (for he showed none whatsoever) but rather to the fact that he had been misled by the erroneous assumption that there had been evidence that Rupprecht himself had given "the assurance" about "loyally" respecting foreign territory, when in truth and in fact, not merely had the Executive Committee not been advised of such assurance, but it had never in fact been given.

(*Middle R.* 218)

The next paragraph of the opinion contains the Judge's summary conclusion:

> "My general summary of the evidence on this issue is that DP was a member of the combination—true, a special member, with a status, rights and

obligations, different from that of the other members, but a member nonetheless."

This of course adds nothing to what had gone before. The Judge leaves us in the dark as to the "status", "rights", and the "obligations". These are more than rhetorical phrases, they are harmless, for the only "rights" were rights under the contracts,—a non-exclusive license and a right (terminated by du Pont's action early in 1940) to obtain technical information,—and the Judge had just himself found that there were no "obligations", for he had found "that DP was not making a promise". And he certainly made no finding of "status". In the review of the evidence that opens this brief, the Court will have seen that du Pont *could not* have obtained any status in the combination, for it never received any of the extensive information about the conduct of the combination, notwithstanding that most of it was in fact sent to National Lead.

(*Last paragraph, R.* 218 *and first, R.* 219)

In these paragraphs the Courts dealt with our argument as to the reasonableness of du Pont's conduct which has been considered, *supra* pp. 65-84.

2. The District Judge's Heading III

The subject of the 1933 agreement is treated in the portion of the District Judge's opinion numbered "III" and commencing at R. 219. We now review this branch of the opinion in detail:

(a) The District Judge made express findings that du Pont's purposes were to obtain technical information and immunity from patent infringement. These enabled it to compete more effectively with National Lead.

(*Paragraph commencing bottom, R.* 219)

The Judge opened with a statement that when the 1933 agreement was made, the "two producers" were "competing", but between them controlled 100% of the commerce in titanium products in the United States. This is deceptive. Together, they aggregated 100% of the business simply because no one else had yet entered the field. The 100% was a mathematical fact only. They did not "together control" the industry, for, as the Judge found, they were "competing".

The Judge made express findings of "DP's purposes in entering into the agreement", as follows (FF 79, R. 292):

> "1) To avoid the expense and risks of patent litigation.
>
> "2) To avoid the research expense in trying to avoid infringement of NL valid patents.
>
> "3) To obtain access to NL's technical experience and patents in the titanium pigment field as well as the patents and the experience of NL's foreign associates."

So far, these were perfectly innocent purposes, supported by the authority of the *Cracking* case.

(b) The District Judge's adverse characterization of "pooling" "to the exclusion of outsiders" rested on a single item of evidence which he himself recognized to have been effectively disavowed by its author, and therefore to be valueless.

The Judge added the fourth finding:

> "4) To strengthen its [du Pont's] own patent position in the titanium pigment field to the exclusion of others than NL by pooling its patents with NL".

The only support that the Judge could find for this fourth finding was in a single document, to which he proceeded (in his opinion) to give disproportionate importance. The document was a letter from a Mr. Ewing, du Pont's London manager, to an officer of Imperial Chemicals in London, in which Mr. Ewing said (Ex. R. 1540):

> "We look upon this Patent Pool as a definite advance in cooperation and the strengthening of both parties' position to the exclusion of outsiders".

The Court will at once recognize the source of the language of the fourth sub-finding above quoted.

Now what are the facts about this Ewing letter? Ewing himself was put on the stand by du Pont and was submitted to cross-examination by the government (R. 744, 751). He said that he had been a subordinate official in London in 1933, had absolutely no knowledge about the National Lead deal or the policy of his company in regard to it, and had made this gratuitous statement without authority (R. 751-753). Indeed, the Judge himself accepted as correct the testimony of Ewing (R. 220):

> "whose disavowal of authority * * * I accept".
> [quoted from the opinion]

We did more at the trial. We introduced affirmative, documentary evidence from two higher officials of du Pont, which gave affirmative proof that Ewing had been in error.

(c) Moreover, that single item of evidence, authored by a du Pont subordinate, was overruled by two documents having the greater authority of two senior du Pont officials.

The first was an express instruction to Ewing, sent by his superior at Wilmington, Mr. Swint, the head of the foreign department of du Pont at its home office in the United States, and which made it plain that no pooling of patents to the exclusion of outsiders was involved (Ex. R. 1506). Swint never saw the Ewing letter quoted by the Judge, and indeed Swint's letter had been written before Ewing's letter (Ex. R. 1505-1510). Secondly, we introduced a quite contemporary memorandum of a conference in Paris at which a still higher official of du Pont, Mr. Pickard (Vice-President), had instructed the Manager of the large Italian company (Montecatini) as to du Pont's position (Ex. R. 1368-1369):

> "Mr. Donegani was told by Mr. Pickard that the du Pont Co. always looked favorably on any measure which was for the good of an industry and that the pooling of patents might probably be a good thing. As to whether or not our Company can be a party to such pooling of patents, opinion of our Legal Dept. would have to be obtained. Mr. Donegani having inquired as to whether we would consider going into a price agreement, it was explained to him that this would be absolutely illegal, according to American laws, and that, therefore, we would not be interested.
>
> "Summing-up the situation, Mr. Donegani stated that he understood that we had no fundamental objection to a talk with the other group of Titanium producers regarding the pooling of patents, but that we were first to inquire into the legal situation to find out if we might even consider such a possibility. Regarding price agreements, which would take place

> between European producers, we were precluded from taking any share in them, due to American laws. He was told that the situation, as summed up by him, was correct."

For the Judge to have still persisted, in the teeth of all this, in drawing inferences from Ewing's statement, must surely be unwarranted. How is any great company, which necessarily has a large number of scattered employees, ever to defend itself in an anti-trust action if a single odd statement by a single odd employee stationed 3,000 miles away from the home office is to be preferred to the authoritative, documentary evidence provided by higher officials at the home office itself, and is even to be preferred to the oral evidence at the trial of the odd employee himself, and that even when the Judge purports to "accept" the oral evidence?

(d) It was not open to the District Judge, having accepted the disavowal of the subordinate, to treat his views as "obviously" true, in disregard of the views of his seniors.

The Judge in this case got around this dilemma by ingeniously suggesting that, although he did not attribute any authority to the Ewing letter (notwithstanding that he was at pains to quote it and to use its precise language as his finding), he was making the quotation only to state what was anyway

> "no more than the obvious".

But this destroys the validity of the quotation, and refers one back to whatever it is that the Judge had said before. Whatever that was, he was now calling it "obvious". What he had said before, however, was only that,

> "though these exchanges are not on an exclusive basis",

it was in the Judge's view clear

> "that the capacity of such a combination to dominate the market is vastly increased, that the capacity for the exclusion of outsiders from the industry is multiplied".

But this was only to draw an inference of law from what had in turn gone before it. That was a finding that the parties had agreed

> "to exchange [under non-exclusive license, of course] all future patents and patent applications and know-how".

But this in turn amounts to nothing more than the Judge saying that he thinks that it is "obvious" that the *Cracking* case in this Court ought to be overruled. In the *Cracking* case, the grant of non-exclusive licenses between the parties extended not merely to their existing conflicting patents, but to future patents and patent applications for many years in advance.

Thus, we are brought back to the point considered in Point II of our brief, and the District Judge's quotation from the Ewing letter has in the upshot added nothing to it.

(*Middle R.* 220)

This paragraph is but another statement of general principle which can have no greater weight than the facts upon which it is based. We now follow the Judge's opinion in so far as it deals with that inquiry:

(c) Du Pont's relations with Zirconium and Virginia Chemical were entirely independent of National Lead's, and were innocent.

(Paragraph bottom, R. 220)

This paragraph related only to National Lead and Virginia Chemical, not to du Pont. There is no suggestion that du Pont had anything to do with the relations, such as they were, between National Lead and Virginia Chemical; and indeed there is an express finding (FF 85, R. at 298) that:

> "There is no evidence that the action of NL and DP with respect to VC was the result of agreement between NL and DP."

(Paragraph top, R. 221)

The next paragraph of the opinion did deal with du Pont. We quote it:

> "DP licensed both American Zirconium and Virginia Chemical. In both instances the licenses were subject to a severe tonnage limitation on the product made under the license and to a royalty on all titanium dioxide produced, whether under the licensed patents or not. DP makes much of the fact that the evidence shows that it never refused a license. It is also true, however, that until 1944, DP did refuse licenses unencumbered by tonnage limitations."

Favorably to du Pont, this establishes both (1) that du Pont never refused a license, and (2) that it licensed both potential competitors who asked for licenses. At least, therefore, the Judge was admitting that he had been wrong in the inference that he had drawn a page earlier that it was "obvious" that both the purpose and effect of du Pont's 1933 agreement was to operate "to the exclusion of outsiders".

But with great respect to the learned Judge, we think that the emphasis that he here gave to the so-called tonnage limitations on the products made under the du Pont licenses was wholly disproportionate. The whole position as to the tonnage limitations has been set out *supra*, pp. 102-106.

If the Judge were right in his viewpoint about there being a "pooling" between National Lead and du Pont "to the exclusion of outsiders", we would expect that du Pont would at least have favored Zirconium, as Zirconium became a partial subsidiary of National Lead (which acquired 20% of its stock) and adhered expressly to the conditions of the international cartel, including even Article XIV of the Contract of 1920. If du Pont was strict in its concessions to Zirconium, this could hardly be evidence of conspiracy with Zirconium's parent National Lead.

(f) The cross-license agreement conferred no power of concerted action and imposed no restraint.

(*Paragraph middle, R.* 221)

The next paragraph of the opinion dealt with the so-called "proliferation of patents". This, as it developed in the Judge's opinion, was but another argument as to why the Judge thought the *Cracking* case had been wrongly decided. He said that the non-exclusive cross-licensing in the agreement between du Pont and National Lead had the result that:

> "The chief spur to private resistance to the grant of patent monopolies has been withdrawn from the parties who, ordinarily, would be chiefly concerned".

He next pointed out that:

> "not a single one of the hundreds of patents here involved has ever been litigated".

But this is a fact wholly without significance, for it follows automatically from any grant of a non-exclusive license under patents that the grantee will not go to the onerous expense of litigating against a patent under which he has received a license. Yet in fact here each party was assiduous in obtaining its own patents on its own inventions,—a point which the learned Judge might have here noted in their favor. The point about non-litigation was the same point that had impressed the three-judge District Court in Chicago in the *Cracking* case, but whose decision was expressly overruled by this Court in the following words of Mr. Justice Brandeis, 283 U. S. at 171:

> "Where there are legitimately conflicting claims or threatened interferences, a settlement by agreement, rather than litigation, is not precluded by the Act."

It remains the law today that, at least in the absence of a showing by the government that the patents are invalid, or of a showing by the government by evidence *aliunde* that the parties were seeking to dominate and control the industry by other means and for other purposes, a mere settlement of patent disputes by exchange of non-exclusive licenses is not illegal. It really was not open to the learned District Judge thus to seek to overrule the *Cracking* case.

(*Bottom R.* 221)

The next paragraph of the opinion returns us to the facts of this case:

> The exchange of know-how between NL and DP was abandoned in 1940 when, as DP says, the

> industry matured. The exchange of patents and patent applications continues".

We pause here merely to mention that the Judge must have meant:

> "The exchange of non-exclusive licenses under patents and patent applications continues".

The paragraph continued:

> "The tonnage limitations in the licenses of American Zirconium and Virginia Chemical was eliminated in 1944. The power of concerted action is still there".

The last sentence is entirely unwarranted, as there is no finding of fact upon which to base it, except only the finding that the parties were exchanging non-exclusive licenses. The argument that the Judge proceeded to erect upon it, and that is found in the next paragraph of the opinion (top R. 222), has already been considered at the opening of this section of our brief.

On this branch of the case, if the judgment below be reversed, the situation will simply be that du Pont and National Lead will be exchanging royalty-free, non-exclusive licenses under the numerous patents owned by each of them, subject, however, to the right of either of them to terminate upon giving three years' notice to the other. The licenses by du Pont to the successors of both Virginia Chemical (American Cyanamid) and American Zirconium (Glidden) will continue without tonnage limitation. We do not know what the status is of any license granted by National Lead.

APPENDIX C

Memorandum Regarding the Protection Afforded in Certain Foreign Countries to Process Patent Claims in Connection with Importation into such Countries of Products Made by a Process Patented in such Countries.

The purpose of this memorandum is to set forth briefly the statutory and case law of certain principal foreign countries relating to the question whether the process claims of patents issued in such foreign countries may be utilized by the owner of the patent to bar imports into the country of products made outside the country in accordance with the patented process. Du Pont through acquisition in 1931 of Commercial Pigments secured the U. S. rights only to certain basic patents dominating the so-called Blumenfeld process used by both Commercial Pigments and du Pont for manufacturing titanium pigments. Foreign patents equivalent to these U. S. Blumenfeld patents existed in the principal industrial countries of the world. In addition foreign equivalents to the National Lead and Titan group of patents issued in similar countries.

The countries under consideration fall into three distinct groups as follows:

Group 1—those whose statutes explicitly extend the protection afforded a patented process to the product of the process, i.e., Czechoslovakia, Germany, Japan and Norway;

Group 2—those whose statutes implicitly extend such protection, i.e., Canada and Great Britain; and

Group 3—those whose statutes are silent on the matter, i.e., France and Italy.

Group 1

CZECHOSLOVAKIA. The Czechoslovakian law of May 27, 1919, extended the Austrian law of January 11, 1897, to the territory of Czechoslovakia, and Section 8 of that Austrian law reads:

"The patent has the effect that the patentee shall exclusively be entitled to commercially produce, bring into the market, expose for sale, or use the subject of the invention.

"If the patent be granted for a process, the effect shall extend also to the articles made directly by this process".*

GERMANY. Paragraph 6 of the German law of May 5, 1936 (which corresponds in substance with Paragraph 4 of the German law of April 7, 1891), reads:

"The effect of a patent is that the patentee alone is entitled to produce the subject matter of the invention industrially, to bring it on the market, to keep it from sale or to use it. If the patent is granted for a process, the effect of the patent also extends to the products made directly by the process."

JAPAN. Article 35 of the Japanese law of April 29, 1921, reads in part:

"As regards a patent of invention of an article, the patentee has the exclusive right to manufacture, use, sell and/or circulate the article, and in the case of a patent of invention of a process, to use the process and to use, sell or circulate articles manufactured by such process.

"A new identical article is presumed to have been manufactured by the same process."

---

*All translated quotations of patent laws in the text of this memorandum are taken from "Patent Laws of the World", Edition of 1911 and Supplements thereto published by the Chartered Institute of Patent Agents, London. This publication is available to the public in the Patent Office Library at Richmond, Va., and presumably elsewhere. The quotations from the Canadian and British Laws are taken from officially published copies of those laws.

NORWAY. Section 5 of the law of June 17, 1910, reads:

"A patent has the effect that no person without the consent of the patentee may use the patent for the purpose of gain by making, importing, offering for sale, trading in, or using the object of the invention (see Section 36).

"If a patent has been granted for a method (see Section Ib), the effect of the patent extends also to the products made thereby."

Section 36 reads:

"A person is guilty of infringement of a patent who, in contravention of this law makes use of the invention in any business or work (see Section 5), after becoming aware that an application for a patent had been lodged, or after the publication mentioned in Section 27 has taken place.

"Prosecution for infringement cannot be commenced before a patent has been granted for the invention."

And Section 1 reads:

"Under this law new inventions which are capable of industrial applications are protected by patent.

"But the following are excepted:—

"(a) Inventions the use of which would be contrary to law, morality or public order.

"(b) Inventions the object of which is an article of food, consumption, or medicine, or a chemical compound, but a patent may be granted for special means of producing the article.

"In order to obtain a patent for an invention, an application for a patent in conformity with the provisions of this law must be lodged at the office for the protection of industrial rights."

Group 2

Of the countries under consideration, Canada and Great Britain fall into this group. They can conveniently be considered together, because the relevant sections of their respective statutes are identical, and the court decisions thereunder have given them the same construction.

Section 40(2) of the Canadian Act of 1935 (which reproduces in substance part of Section 17 of the Act of 1923) and Section 38A(2) of the British Act of 1907 each read:

> "In an action for infringement of a patent where the invention relates to the production of a new substance, any substance of the same chemical composition and constitution shall, in the absence of proof to the contrary, be deemed to have been produced by the patented process."

As the decisions make clear, these sections of the Canadian and British Acts are based upon the premise that a patent for a process protects the product of that process.

Turning first to the British cases, all of which constitute precedents in Canada as well as in Great Britain, in *Saccharin Corporation Ltd.* v. *Mack & Co.* (R. P. C.* vol. 23, p. 25), the plaintiffs sued for infringement of seven patents. It was held that, to constitute infringement, the article complained of must have been made by some process covered by the plaintiff's patents.

In *Saccharin Corporation Ltd.* v. *National Saccharin Co., Ltd.* (R. P. C. vol. 26, p. 654), the plaintiffs sued for infringement of three patents relating to processes used in the manufacture of saccharin. The importation of saccharin from abroad was alleged to constitute the infringement. The defendants alleged that the imported material was made by the processes of expired patents. It was held

*Ruling Patent Cases.

that the plaintiffs were entitled to an interlocutory injunction.*

In *United Horse Nail Co.* v. *Stewart* (R. P. C. vol. 2, p. 122), the pursuers sued for infringement of four patents relating to machines for use in the manufacture of animal shoe-nails. The sale of nails allegedly made by infringing machines was claimed to constitute the infringement. It was held that two of the patents were invalid but that the other two were infringed. The case was carried to the Lord Ordinary, the Court of Session and the House of Lords, and the original decision as to infringement sustained in each instance (R. P. C. vol. 5, p. 260).

Turning to the Canadian cases, in *Toronto Auer Light Co., Ltd. et al.* v. *Collins* (Ottawa Reports, vol. XXXI, p. 18), and *The Auer Incandescent Light Manufacturing Co., Ltd.* v. *O'Brien* (Exchequer Court Reports vol. 5, p. 243), it was held that the importation into Canada of incandescent gas mantles made abroad infringed a Canadian patent for the method of making such mantles. In the former case, the Ontario High Court of Justice said:

> "A patent granting the exclusive right of making, constructing, using and selling to others to be used, an invention, as described in the specifications setting forth and claiming the method of manufacture, protects not only the process but the thing produced by that process, and an action will lie against any person purchasing and using articles made in derogation of the patent, no matter where they come from."

In the latter case, the Court said:

> "It is not open to anyone in Canada to report for use or sale appliances made in a foreign country in

*See also *The Saccharin Corporation Ltd.* v. *Haines, Ward and Co.* (R. P. C. vol. 15, p. 344); *Saccharin Corporation Ltd.* v. *Dawson* (R. P. C. vol. 19, p. 169).

accordance with the process protected by the plaintiff's patent."

Fisher and Smart, in "Canadian Patent Law & Practice" 1914—Toronto, Canada Law Book Co., Ltd.—Philadelphia—Cromarty Law Book Co. (pp. 184, 185) state the law, as follows:

> "A process patent protects not only the process, but the thing produced by the process, and an action will therefore lie against any person purchasing and using or selling articles made in derogation of the patent, no matter whether they are made in Canada or elsewhere. . . .
>
> "The onus is on the patentee of proving that the articles said to infringe were in fact made by the patented process. Where, however, the articles were made in another country, a prima facie case made by the patentee will throw the onus on the defendant to show that the articles were not made according to the process. Where it is shown that the process is the only known method of making the product, such a prima facie case is made out. . . ."

See also Fox, "Canadian Patent Law & Practice", 1937—The Casewell Co., Ltd., Toronto, pp. 325, 326, who states:

> "Infringement is committed by the importation of infringing articles made abroad. Use in the country of articles made abroad on a patented machine or by a patented process constitutes infringement. If there is some act committed in Canada by the defendant in derogation of the patentee's rights there is infringement. Thus, where a foreign firm were requested to supply goods which constituted an infringement of a patent to England and they sent an invoice stating that the goods were sent to a forwarding agent also abroad to be at the

disposal of the persons ordering, it was held that prima facie this was only a colourable evasion of delivery in England and leave was given to serve them. And where infringing articles made abroad were exhibited in England but without sale or intention of sale, it was held nevertheless to be such a user of the invention as to amount to an infringement. A contract for sale and for delivery abroad of a patented article made abroad and delivery accordingly does not constitute infringement."

Group 3

FRANCE. Article 41 of the French law of July 5, 1844, reads:

> "Those who have knowingly received, sold, or exposed for sale, or introduced into French Territory one or more infringing articles, shall be punished with the same penalties as infringers."

French patents contain no claims, and a patentee is permitted, on the institution of suit, to make any claim within the ambit of his disclosure. Consequently, on the importation of a product the production of which is described in a French patent, the patentee would naturally draft a claim to the product itself, and such claim, if valid, would undoubtedly be sustained by the Courts. In "Chemistry and Continental Patent Law" Dr. E. Muller, Verlag Chemie, Berlin, 1932, discussing French law, states:

> "In accordance with court decisions, a process patent protects also the product of such process, even where the product is not mentioned in the résumé of the patent. For example, where a patent was directed to a process of producing aniline blue and aniline violet, the court held that these products came under the scope of protection of the process patent."

In the "Handbook of (French) Patents", 1931, p. 66, Section 126, Massius states:

> "If a means or process patent covers only the means or steps claimed in such patent, such means or steps must be understood in their broadest meaning.
>
> "The process patent, in addition to the means explicitly claimed therein, also covers means which may be derived, either directly or indirectly, from the process used by the patentee.
>
> "It is understood that such means are integral parts of the discovery of the patented process. If the patentee did not indicate them, it is because their number was too large for him to subject himself to such enumeration, but the protection afforded by the process, nevertheless extends to them."

The same author, in the same handbook, page 60, Section 107, also states:

> "The distinction between 'product' and 'means' is not very clear.
>
> "A product may always be considered to be a means; if it is viewed from the point of view of the use to which it is put, it is a means; if it is viewed as the article obtained, it is a product."

ITALY. The present law in Italy is the Royal Decree of June 29, 1939, which became effective on May 1, 1940. Prior to that time, the governing law was the law of January 31, 1864, Articles 1 and 2 of which read:

> "1. The author of a new invention or discovery in the industry has the exclusive right of working the same and of deriving profit therefrom during the time, within the limits, and under the conditions prescribed by the present Decree.
>
> "This exclusive right constitutes an industrial privilege.

"2. An invention or discovery is said to belong to industry whenever the immediate object is:—

1) An industrial product or result

2) An instrument, machine, tool, engine, or any mechanical arrangement

3) A process or method of industrial production

4) A motor, or the industrial application of a force already known

5) Finally, the technical application of a scientific principle, provided it give immediate industrial results.

"In this last case the privilege is limited solely to those results expressly pointed out by the inventor."

In "Chemistry and Continental Patent Law", referred to above, Dr. E. Muller, in discussing Italian patents, states that a process patent affords automatic protection to the product produced thereby, even if the latter is not specifically claimed.

It will be observed that France and Italy are the two countries in which the doctrine is not plain on the face of the statute and in which presumably the doctrine of product protection for process claims would be more arguable in its application to any particular case. This fits in with Dr. Blumenfeld's testimony (R. 805).

However, the principal industrial countries to which du Pont would presumably have exported (if it had wished to export at all), e.g. Great Britain, Canada, Germany and Japan, are all countries in which on the face of the statutes themselves there is a restraint, explicit or implicit, upon importation of a product manufactured by a process patented in that country.

In all countries covered by this memorandum, as well as in others, the Blumenfeld and Titan groups had extensively patented their respective titanium pigment inventions.

APPELLANT'S REPLY BRIEF

I. The Merits

The government in its brief as appellee states the question as being "whether the finding of the District Court that du Pont was a party to the unlawful combination is supported by the evidence" (2).[1] We do not accept this. *The question is whether the findings of the District Court are as a matter of law sufficient to sustain the conclusion that du Pont became a party to the unlawful conspiracy and combination.* The legal sufficiency of a specific finding of the District Court is thus placed directly in issue. That finding reads: "DP, through Rupprecht and Krebs, by these assurances and Exhibit E, joined the conspiracy found herein to exist between NL and its foreign associates" (R. 289). This was the only finding of fact on which the District Court based its decision that du Pont did become a member of the combination. Du Pont contends that neither the assurances as found nor Exhibit E (the non-exclusive cross-license agreement, R. 69) is sufficient as a matter of law to make du Pont a member of the combination.

The government cannot avoid this issue. It did not assign as error any finding of the District Court or any refusal of the District Court to find (R. 330-331); indeed at page 8 of its brief in No. 89 the government specifically states that the findings of fact "are not challenged by the government". The government, however, undertakes once again in its brief as appellee to present many carefully culled bits of evidence in support of the broad assertion

[1]Reference numbers in parentheses are to the pages of the proof of the government brief as appellee received by us January 21, 1947.

that the evidence taken as a whole establishes du Pont's participation in an unlawful conspiracy and combination. The record references are often to odd sentences in occasional documents and are presented apart from their context. Very few of them can be attributed to du Pont at all, since they are admissions of National Lead or other alleged conspirators and not independent proof *aliunde* as to du Pont.

Whatever their probative value, all of the government record references and points were argued at length before the District Court. Indeed, the government proposed many findings based upon these very points which the District Court as the primary trier of the facts, after carefully reviewing all the evidence, denied. (See, for example, pages 52-54 of du Pont's main brief in No. 91.) This denial was based upon substantial evidence which the government in no place refers to.

The sole issue presented under the appeal papers which the government must meet, in view of Rules 9 and 13 of this Court, is whether the District Court's conclusion is supported by his specific findings.

(A) The "Assurances".

The suggestion (60) that du Pont has concocted an ingenious technical argument designed to take unfair advantage of the District Court's findings is amazing, to say the least. Du Pont's position in this Court on the issue under discussion here has not varied in the slightest from the position it has taken in this litigation from the outset and long before the findings were settled. It argued vigorously and at length before the District Court that an agreement must be shown, and that what du Pont did was reasonable

and beneficial to trade and to competition. The District Court felt otherwise and carefully preserved this issue of law for review by this Court.

The District Court chose the word "assurance", having well in mind its inability to find any territorial agreement or commitment by du Pont. It refused to find an oral agreement or an agreement of any kind by implication. The government seeks to twist this by now saying that the District Court used the word "assurance" in the sense of a guaranty, pledge or commitment which was not legally enforceable (62). This is just not so.

The District Court specifically stated[2] that it used the word "assurance" to mean a statement by du Pont from which it could withdraw at any time and as to which it was not even morally bound by considerations of business practice or ethics. Indeed, this was plainly reflected in Finding 73 (R. at 287-288) in which the District Court expressly said that "DP was not making a promise * * * it was doing no more than giving expression to its then existing policy * * *". The constant effort of the government to avoid the clearcut legal issue presented on this appeal can only reflect a recognition that the position of du Pont is basically sound.

The government cases throw no further light on the issue. We need not repeat here our statement as to our understanding of the meaning and effect of the *Interstate Circuit* and other recent decisions of this Court on the question of conspiracy and combination. (See pp. 60 to 64 of du Pont's main brief in No. 91.) We feel that these

---

[2]This statement was made at informal conference on the findings, but we are confident our assertion will not be challenged by government counsel who participated in the trial.

cases are not properly interpreted by the government. The numerous lower court decisions cited principally at pages 68-69 of the government brief stand only for the proposition that a conspiracy may be established by circumstantial evidence, and that the conduct of the parties may be analyzed for the purpose of determining whether or not an unlawful agreement, association or partnership in crime exists; but these cases in no way sustain the government's apparent view that no "meeting of the minds" is necessary. Indeed most of the cases cited hold specifically to the contrary.

The recent decision of this Court in *Direct Sales Co.* v. *United States,* 319 U. S. 703, makes clear the standards which apply. The Court pointed out (p. 713) that "more than suspicion, more than knowledge, acquiescence, carelessness, indifference [or] lack of concern" is necessary. The Court must find not alone that du Pont had clear and unequivocal knowledge and that it acquiesced, but also that it joined "both mind and hand" with the other alleged conspirators for the purpose of accomplishing the objects of the conspiracy (319 U. S. at 713). A definite difference between "lawful cooperation and criminal association" is recognized (319 U. S. at 713), particularly where the transactions involve normal commercial relationships.

The cases have emphasized again and again that the government must show that the parties worked together understandingly with a single design for the accomplishment of a common unlawful purpose. *Braverman* v. *United States,* 317 U. S. 49, 53; *United States* v. *Falcone,* 311 U. S. 205, 210; *Gebardi* v. *United States,* 287 U. S. 112, 121; *Wong Tai* v. *United States,* 273 U. S. 77, 81; *Frohwerk* v. *United States,* 249 U. S. 204, 209; *Williamson* v. *United States,* 207 U. S. 425, 447; *Bannon and*

Mulkey v. *United States*, 156 U. S. 464, 468; *Dealy* v. *United States*, 152 U. S. 539, 547; *Pettibone* v. *United States*, 148 U. S. 197, 202; *United States* v. *Britton*, 108 U. S. 199, 204; *United States* v. *Hirsch*, 100 U. S. 33, 34.

The findings will not support a contention that du Pont knowingly co-operated to further the objects of the cartel, that there was "informed and interested co-operation, stimulation and instigation", or that there was any "stake in the venture" or joining of both "mind and hand" in the enterprise (319 U. S. at 713). Du Pont followed a course of conduct at all times independent; and its actions did not prevent competition with National Lead. They created it. The absence of a finding of unlawful agreement express or implied is fatal to the government's case.

(B) The Reasonableness of du Pont's Conduct.

In our main brief in No. 91 at pages 65 to 84 we presented arguments and authority in support of the proposition that what du Pont said or did must be measured by the test of reasonableness, assuming *arguendo* that agreement is not necessary to establish violation of the Sherman Act. It was there demonstrated that du Pont's conduct was in all respects wholly reasonable and proper under the circumstances. It is only necessary here to observe that the government has defaulted on this point, since its brief wholly fails to discuss it.

(C) The Non-Exclusive Cross-Licensing Agreement.

Du Pont has not, as the government states (71), conceded that the District Court found the cross-licensing agreement between du Pont and National Lead unlawful. The findings speak for themselves and there is no such

finding. The District Court in its opinion appeared to criticize the agreement, however, and we therefore submitted, as our main brief in No. 91 explains under Point II at p. 84, an argument that the cross-licensing agreement was lawful under the decision in the *Cracking* case, *Standard Oil Company (Indiana)* v. *United States*, 283 U. S. 163.

The government in its brief now for the first time states that it considers the cross-licensing agreement illegal. The government did not ask for a finding below to this effect (R. 78-118) nor did it charge that the agreement was illegal in its complaint (R. 1-40) or opening argument. Its present position that the agreement is illegal seems wholly inconsistent with its past position and assignments of error (R. 330-331).

The government invokes the *Cracking* case as authority for its contention that the agreement is illegal. In its treatment of the *Cracking* case, however, the government falls into its recurrent error of failing to distinguish between an agreement between two parties at arm's length and a joint program undertaken by both together. In this case, the license agreement related only to the two parties, du Pont and National Lead, and was only a non-exclusive exchange between them of patent licenses and technical information. Such an agreement, as the opinion makes clear, raises no question under the anti-trust laws. This was the subject-matter of Mr. Justice Brandeis's opinion down to the bottom of p. 170, concluding:

> "The government concedes that it is not illegal for the primary defendants to cross-license each other and the respective licensees; and that adequate consideration can legally be demanded for such grants."[3]

---

[3]The "primary defendants" were the Standard Oil Companies of New Jersey and Indiana, The Texas Company and Gasoline Products Company.

Up to this point in the opinion there was no consideration whatsoever of the size of the defendants or the nature of the industry. None was necessary, for the rule to permit cross-licensing is absolute, as no restraint of trade can be involved in a non-exclusive unrestricted cross-license, the only effect of which can be to liberate trade, particularly where (as here) there were mutually blocking patents.

But in the *Cracking* case the primary defendants went further. They not merely cross-licensed each other; they agreed on a joint licensing program, under which they fixed minimum royalties that each should charge for the patents of the other, pooled the royalties, and divided them in agreed proportions. It was to determine whether these provisions for joint action had the actual effect of restraint of trade that the parts of the opinion relating to domination, from which the government takes its quotations, were directed. 283 U. S. at 172-179. The subject is introduced with the sentence beginning in the last line on p. 170 and runs throughout the balance of the opinion. The sentence reads:

> "But it [the government] contends that the insertion of certain additional provisions in these agreements renders them illegal".

The additional provisions all relate to joint action by the patentees in granting sub-licenses, including joint fixing of royalties and pooling of royalties. No such provisions existed between du Pont and National Lead. The question of domination is therefore wholly extraneous to this case.

II. Technical Information.

This point is covered fully in Part Two of du Pont's main brief in No. 91, and we will therefore only answer succinctly matters raised for the first time in the government's brief.

The government says (77):

(1) Du Pont's current technical information was acquired as a result of the unlawful combination.

(2) Technical information acquired by du Pont prior to 1940, when the exchange with National Lead ceased, is a prerequisite to technical information subsequently acquired.

(3) No segregation of technical information before and after 1940 can be made.

There is no evidence supporting these extraordinary statements. The government not only has no findings to support them but never even asked for such findings. It does not now even cite record references.

If the facts established what the government asserts, that would be one thing; but they do not. All evidence is to the contrary, for competitors have entered the industry and successfully competed without *any* du Pont technical information, and the industry is now by the government's own admissions mature (Gov'ts Brief No. 89, pp. 32, 52). The art essential to basic manufacture is well known and publicized, many basic patents have expired, and obviously experienced and trained personnel is available.

Supreme Court of the United States

OCTOBER TERM, 1946

No. 91

E. I. DU PONT DE NEMOURS AND COMPANY, *Appellant*,

v.

THE UNITED STATES OF AMERICA, *Appellee*.

Appeal from the District Court of the United States for the Southern District of New York.

APPELLANT'S SUPPLEMENTARY BRIEF CALLING ATTENTION TO NEW MATTER.

When this matter was argued before this Court, appellant du Pont sought to focus attention upon the slender thread by which the District Court found du Pont to have joined the extensive world-wide conspiracy and combination in titanium pigments, namely, the two letters printed at pages 121-4 of our main brief in No. 91. The Government refused to meet this issue squarely in its briefs or on oral argument, but rather by parade of all the evidence sought to create the impression that the District Court found that du Pont joined the conspiracy in some other manner. (Cf. Brief for the United States Nos. 90, 91)

This supplementary brief is submitted in view of a statement which has just come to the attention of counsel, made by the United States in another antitrust proceeding, which specifically recognizes that du Pont was in fact found by Judge Rifkind to have entered into the conspiracy on the

basis of the above two letters and those two letters only. The statement is as follows:

> General Electric employs this same argument to minimize the Government's direct evidence of conspiracy. General Electric emphasizes the small number of documents produced by the Government (p. 123) and undertakes to have the Court disregard them by comparing them with the great mass of testimonial assertions of General Electric witnesses as to "policy," denials of conspiracy, protestations of active competition. The direct evidence of conspiracy is a substantial body of *documents*, "cinematographic photographs" of purpose and intent *in action*. But further, there is confirmation of these purposes, for the written expressions of purpose were carried out and the conspiracy therefore can be traced both forward and backward. We have discussed these documents in our main brief. They must be considered together, not piecemeal. By this most obvious and requisite treatment of evidence, Judge Rifkind, in the *National Lead* case, found that a great industrial corporation, Dupont, conspired to join a great international titanium cartel, from TWO LETTERS. Only one was written by Dupont. The other was from the addressee, National Lead, to I. G. Farben with a copy to Dupont. The copy, however, was not even found in Dupont's files. From these two letters Judge Rifkind found conspiracy even though on this issue he declared that as to Dupont (63 F. Supp. at page 527):
>
> > • • • the facts are by no means as clear. Stoutly it denies any complicity in the combination; and much of the evidence supports its denial, • • •
> >
> > In sharp contrast with National Lead, Dupont exhibited, from the very beginning of its interest in titanium, an alert consciousness of the antitrust laws and moved cautiously and under the guidance of trained antitrust lawyers. The question is whether it succeeded in avoiding not only the form but also the substance of transgression.
>
> In its letter to National Lead, Dupont pointed out that it was intent upon obeying the antitrust laws (63 F. Supp. 513, note 11) and would not make any com-

mitments as to territories but assured National Lead that in result affairs "will be eminently satisfactory to your foreign associates." National Lead then wrote to I. G. Farben sending a copy of the Dupont (Krebs Pigment & Color Corp., an affiliate) letter and saying that careful reading of the letter "will surely indicate to you the spirit in which they are entering into this contract and their efforts to meet your views. We feel that experience will prove that such will be the case." Upon the strength of these two letters, and expressly finding that Dupont was bound by the second letter, Judge Rifkind found that: "as to territorial delimitations of the titanium pigment business, Dupont joined the combination." (Reply Brief for the United States, filed in the District Court of the United States for the District of New Jersey, in *United States* v. *General Electric Company*, Civil Action No. 1364, Pages 21-3).

We call attention to the fact that this statement was made on January 10, 1947, immediately prior to the argument in this case before this Court.

We also call attention to the fact that this statement evidences the intention of the United States to use the decision of Judge Rifkind in the District Court below as authority for broadening and extending the conspiracy doctrine beyond previous limits in a manner which, as we suggested in this Court, will undermine the traditional rules which in the past have protected the rights of persons accused of conspiring against the law.

OCTOBER TERM, 1946

No. 90

NATIONAL LEAD COMPANY, TITAN COMPANY, INC.,
APPELLANT

v.

THE UNITED STATES OF AMERICA

No. 91

E. I. DU PONT DE NEMOURS AND COMPANY,
APPELLANT

v.

THE UNITED STATES OF AMERICA

ON APPEALS FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE SOUTHERN DISTRICT OF NEW YORK

BRIEF FOR THE UNITED STATES

OPINION BELOW

The opinion of the district court (R. 185) is reported in 63 F. Supp. 513.

JURISDICTION

The judgment of the district court was entered on October 11, 1945 (R. 307). The Government's

petition for appeal and the separate cross appeals of the defendants were all filed and allowed on April 18, 1946 (R. 329, 334, 335, 350).

The jurisdiction of this Court is conferred by Section 2 of the Act of February 11, 1903, 32 Stat. 823, 15 U. S. C., sec. 29, and Section 238 of the Judicial Code, as amended by the Act of February 13, 1925, 43 Stat. 936, 938, 28 U. S. C., sec. 345. Probable jurisdiction was noted on May 20, 1946.

QUESTIONS PRESENTED

The questions presented by du Pont in No. 91 are: (1) Whether the finding of the district court that du Pont was a party to the unlawful combination is supported by the evidence; and (2) whether the district court had the power to require du Pont to disclose to a licensee under paragraph 7 of the judgment, the methods and processes used by du Pont at the date of the license in its commercial practice under the licensed patents in connection with the production of titanium pigments; and, if such power exists, whether the district court abused its discretion in compelling such disclosure in this case.

The first question presented by No. 91 will be considered in point I and the second question in point II herein.

The questions presented by National Lead in No. 90 are: (1) Whether paragraphs 5 and 6 of the judgment, which enjoin the performance of

contracts found to be in violation of the Act and the making of contracts comparable in purpose and effect, have been or could be shown unduly to restrict the right of National Lead to enter into necessary and proper contracts; (2) whether the district court should not have compelled the defendants to license any applicant royalty free under their existing patents and patent applications and all patents issued within 5 years; (3) whether National Lead should be prohibited from owning jointly with some of its foreign co-conspirators certain foreign producers of titanium pigments; and (4) whether National Lead should have been required to divest itself of certain of its physical properties and facilities.

The first of these questions will be considered as point III herein and the third question as point IV.

As to the second point, the Government agrees with National Lead that the defendants should not be permitted to exact royalties for the use of the patents which have been abused. Its argument in support of this position is contained in its brief in No. 89, pp. 54–121. The Government, unlike National Lead, has not contended that, under the facts of this case, the defendants should be enjoined from enforcing patents issued within five years from the date of the judgment, unless issued on a pending application. The fourth question presented by National Lead will

not be discussed in this brief, since it is considered in the Government's brief in No. 89, pp. 131–144.

STATEMENT

The brief for the United States in No. 89, this Term, pp. 4–40, contains a Statement of most of the facts pertinent to the issues raised by the appeals in No. 90 and No. 91. Such additional facts as are necessary will be set forth in the Argument.

SUMMARY OF ARGUMENT

I

The evidence supports the finding that DP was a party to the unlawful conspiracy. DP, the largest domestic producer of lithopone, was aware of the threat of titanium pigments to its lithopone business. Therefore, in 1931, it purchased the assets of Commercial Pigments, the only domestic producer of titanium pigments other than NL.

Prior to the purchase of CP by DP, plans were already under way for a world-wide patent pool. These plans could be carried out only if an arrangement was made between the American producers. The arrangement then being considered by the American producers, CP and NL, was a cross-licensing of patents, the exclusionary effect on potential competition of such an arrangement being specifically recognized. The consummation of the plans for a world-wide patent pool was postponed and not effected until after DP and NL entered into the 1933 agreement.

NL was prevented by Article XIV of the 1920 agreement from executing the agreement with DP until NL had secured the approval of its foreign associates. IG, NL's German associate, refused to give its approval on the ground that the agreement did not clearly indicate that DP would respect its exclusive territorial rights. It requested that NL "clearly" express "in some form" that it would do so. DP wrote an ambiguous letter to NL referring to its inability to make "any commitments" in view of the antitrust laws, but stating that the results would be satisfactory to "your foreign associates." NL, after conferences with DP, wrote a letter to IG construing and interpreting the DP letter as satisfactorily replying to the request of IG. This letter was shown to and read by DP. Jebsen, NL's foreign representative, then forwarded these letters to IG along with a letter written by him in which he stated that DP had verbally expressed to him the same views as were contained in the NL letter. IG replied, noting the assurances of DP and NL that they would respect the TG territory and, "relying on this loyal promise," approved the agreement.

After the execution of the agreement, DP cooperated with the members of the combination. It exchanged technology with NL's foreign associates; exchanged patents and patent applications on a royalty-free basis with them; and did not export to the exclusive markets of NL's foreign

associates. On the other hand, it did not exchange technology with VC and Zirconium, its American licensees; refused to exchange future patents with Zirconium, and drastically limited their production. Its competition with NL is restricted and does not affect the price structure.

The District Court found that although du Pont had not agreed with TP or NL that it would refrain from exporting titanium pigments into TG's territory and that it would grant NL's foreign associates exclusive licenses under DP's foreign patents, in order to obtain the consent of IG to Exhibit E, DP gave assurances that as a practical matter such exports would not take place and that the practical effect of its conduct would produce substantially identical results as if it did so agree to grant exclusive licenses. It carried out these assurances in accordance with the expectations of the other conspirators. Such knowing and intentional cooperation with other conspirators for mutual benefit was clearly sufficient to support the finding that du Pont was a party to the conspiracy. Binding commitments such as are required by the law of contracts are obviously not necessary. *Interstate Circuit* v. *United States*, 306 U. S. 208. The NL-DP agreement of 1933 was not a lawful interchange of patents such as was permitted in *Standard Oil Co. (Indiana)* v. *United States*, 283 U. S. 163. The setting and effect of the agreement by itself and in conjunction with other understandings and the conduct of the parties

clearly brings it within the caveats in the *Standard Oil* case that patent pooling where domination exists or which effects a monopoly is unlawful.

II

The provision in the judgment requiring du Pont at the request of a licensee to impart in writing the methods and processes used by it in its commercial practice under the licensed patents was neither beyond the power of the district court nor an abuse of discretion. Such relief was essential if effective competition is to enter the industry. Defendants, prior to 1940, exchanged such information among themselves. A large and inseparable portion of du Pont's technology was acquired as a result of the unlawful combination.

III

National Lead does not demonstrate that paragraphs 5 and 6 of the judgment, *infra* p. 79, impose unjustified restrictions on its right to contract in the future. Paragraph 5 enjoins the further performance of existing contracts found to be unlawful. The challenged portion of paragraph 6 merely enjoins the entering into of any agreement or plan having the purpose or effect of continuing or renewing any of the agreements the further performance of which was enjoined in paragraph 5. The requested enlargement of the proviso in paragraph 6 to include producers has not been shown to be necessary.

IV

NL contends that paragraph 8 of the judgment constitutes an abuse of the trial court's discretion. Paragraph 8 prohibits NL from continuing with certain of its coconspirators jointly to own certain foreign corporations engaged in the titanium pigment business. These jointly owned corporations were formed in furtherance of a purpose of NL to protect the markets allocated to it by the 1920 agreement and to strengthen its position in the domestic market vis-a-vis potential domestic competitors. The continued joint ownership of these corporations will have the necessary effect of preventing the growth of foreign competition. That the prohibition will not assure foreign competition is immaterial since it is the duty of the court to remove unlawful obstacles to the emergence of competition. It is unnecessary to consider if the joint ownership arrangements standing alone would be unlawful since the court has power to prohibit arrangements which would be lawful apart from the conspiracy. Here the joint ownership was used as an effective means of restraining trade and the restraint will continue if the prohibition is eliminated. NL claims that the prohibition will cause it a financial loss. Even if this be true it is immaterial since effective relief cannot be granted without the prohibition.

ARGUMENT

I

DP WAS A PARTY TO THE UNLAWFUL CONSPIRACY AND EQUALLY RESPONSIBLE WITH NL FOR THE UNLAWFUL RESTRAINTS IMPOSED UPON THE INTERSTATE AND FOREIGN COMMERCE OF THE UNITED STATES

The district court found that DP became a party to the unlawful combination (R. 289). It further found that a common purpose of DP and NL in entering into the agreement of 1933, Exhibit E, was to strengthen their patent position in the industry to the exclusion of all others, and that an effect of the agreement was to give DP and NL together domination and control over the titanium pigment business in the United States (R. 291–292). These findings are amply supported by the evidence.

1. DP entered the industry by purchasing a competitor, a purpose being the protection of its lithopone business

Prior to its entry into the titanium pigment business, DP, the largest producer of the competitive pigment lithopone (RE. 961), had become increasingly aware of the threat of titanium pigments to its position in the pigment market. It was of the opinion that "lithopone has apparently reached its maximum and a decline in lithopone business is indicated" while "titanium pigments are of increasing importance" (RE. 1049). It recognized that there was a direct relation

between the price of lithopone and titanium pigments and that reductions in the price of titanium dioxide would require reductions in the price of lithopone (RE. 1067). At this time the price of titanium dioxide had already dropped from 40¢ a pound in 1928 to 20¢ a pound in 1931 (R. 1149–1150).[1] In addition, CP estimated its production costs at 7.65 cents per pound (R. 1111), and believed that it could be sold at a satisfactory profit for 12 cents per pound (R. 1036).

During the years immediately preceding 1931, DP had several times discussed with NL and CP a close association in the manufacture of titanium pigments (RE. 1049). NL was not then receptive to DP's overtures. However, CP became receptive after DP commenced development work (RE. 1049). DP, after an extensive and exhaustive survey of the titanium pigment industry in February 1931, concluded that, if it continued its program of independent action in this field, a capital expenditure of more than two and one-half million dollars for the construction of a commercial plant, etc., would be required in the next two years and that, by that time, the two American producers "would be firmly in the saddle with established business so that the entrance of du Pont in the field with a large plant could only mean lower prices and our plant operated at only part capacity for some time" (RE. 1051). Unquestionably, a purpose of DP in

[1] The price lists therein referred to, Exhibits 24 and 42, were not printed but are a part of the record.

entering the industry by purchasing, in July 1931, the assets of CP, an actual competitor in the pigment field and a potential competitor in the titanium pigment field, was to prevent a substantial decline in the price of titanium pigments and a consequent decline in the price of lithopone. The effectuation of this purpose would necessarily require cooperative competitors.

2. The world-wide pooling of patents and commercial cooperation between the titanium producers of the world were aided by the DP cooperation with the combine

At and prior to the time DP was negotiating for the business of CP, the companies operating in the United States and the rest of the world under the Barton-Rossi-Jebsen patents and under the Blumenfeld patents were engaged in negotiations for a pooling of patents and technical information and for further cooperation. A *tentative* agreement had been worked out by representatives of all of the producers at a meeting in Paris in March 1931. It was recognized, however, that a world-wide combination of producers could only occur if the two American producers "enter into some agreement as regards patents and development in the U. S. either by a combination of companies or by cross-licensing agreement" (RE. 1271).[2]

[2] The United States producers were considering a cross-licensing of their respective patents. An advantage of such an arrangement was stated to be the establishment of a "stronger position of both as against a possible third com-

The acquisition by DP of the business of CP, one of the two American producers, did not terminate the negotiations for a world-wide patent pool and commercial understanding; the consummation of the world-wide arrangements was merely deferred until *after* a satisfactory agreement had been worked out between the two American producers. This was in accord with the understanding reached at the Paris conference.

3. DF was willing to aid in the negotiations abroad in order to secure the kind of pooling agreement it desired in the United States

In August 1931 Rupprecht was elected president of the new DP company "Krebs," which took over the assets of CP (R. 587). Tichnor and Chase, directors of Krebs, continued to maintain the contacts previously established by them with the European companies. Blumenfeld was advised that the "whole situation will be strengthened" (RE. 3619). They explained to Dr. Jebsen, NL's foreign representative, at a meeting in London in September 1931, that the acquisition of CP by DP would "in no way impair the planning of a coming together of their and our group—it would rather further the matter" (RE. 1224). Mr. Ewing, manager of the DP London

pany" (RE. 1271). It was recognized that the combined patents would present "a very formidable set-up against anyone attempting to enter the titanium field" (RE. 1563). However, negotiations between NL and CP were held in abeyance pending the Paris conference (RE. 953).

office, was present at this meeting. After similar assurances from Chase and Tichnor, Dr. Blumenfeld was willing to await the outcome of continued conversations between DP and NL in the United States (R. 1225). That such conversations were continued in the United States is evident. Jebsen was advised in December 1931 by NL that Chase and his associates "would like to secure a working arrangement in the United States and in order to get it are willing to be of any assistance they can in helping us to secure a similar arrangement in Europe" (RE. 768).[3]

By January 1932, the DP interest in an exchange of licenses in the United States was becoming keener as Jebsen was then informed by NL "the du Pont interests as well as the Commercial Solvent people seem very keen on the exchange of licenses in this country" (R. 1234).[4]

[3] Jebsen had been previously advised by NL in November 1931 that an agreement between the two American producers in the form of a license could be very easily arranged (RE. 1232).

[4] While the district court found that Chase and Tichnor, the directors of Krebs, were without authority from DP, there is nothing in the record to indicate that they did not have authority to act in the negotiations for DP. The district court apparently felt the burden of proof was on the Government to show actual authority and the fact that they were directors of Krebs was immaterial (F. 71, R. 278). The record nevertheless discloses that DP desired an exchange of licenses with NL and the inference is inescapable that they were at least conducting negotiations in an unofficial capacity and with the knowledge of DP, for as directors of Krebs their only interest in the matter could be that connected with the interests of Krebs.

It is significant that Barton, the inventor of the Barton patents and one of the founders of the industry, expressed the opinion to NL in February 1932, that the future of the titanium pigment industry depended more on the technical and business initiative and aggresive development than upon patent protection.[5]

Chase and Tichnor, having assured Blumenfeld "that du Pont would continue the conversations with National Lead Company" (RE. 1225, 3619), and the groundwork having been fully laid for further negotiations between DP and NL, Rupprecht, the president of Krebs, thereupon continued further negotiations with NL. These negotiations which commenced in April 1932, resulted in the agreement of 1933, Exhibit E. It is important to note that NL advised DP of the

[5] He informed NL in February 1932 that "future progress in the titanium pigment industry will probably depend more on technical and business initiative and aggressive development than upon patent protection; and in any arrangement for pooling interests the chief advantages will probably result from the exchange of technical information and cooperation relative to construction, operation, purchase of raw materials and marketing" (R. 1249). This is of import since the 1933 DP–NL agreement provided for an exchange between NL and DP of technical information on an unlimited basis within the licensed field. The Government regards the Barton comment as to the future of the titanium-pigment industry as significant since it contends that the 1933 agreement was essentially and principally a commercial arrangement and that one of the principal purposes and objects thereof was to give DP and NL joint domination and control of this industry. The district court found this to be one of the necessary effects of the agreement (R. 292).

restrictive license agreement which NL had with its foreign associates in May 1932 (RE. 1286). It is also clear that by this time DP had apparently discussed other things with NL than merely settling patent disputes, for NL advised Rupprecht at the time the plant inspections commenced that "there are some things which you have in mind that will have to be held in abeyance for development" (RE. 1286).[*]

4. The negotiations leading to the 1933 agreement

The negotiations for the agreement took the form of the settlement of a patent infringement controversy. Plans were made whereby the two companies would send representatives to inspect the plants and plant operations of the other for the apparent purpose of determining whether either company was infringing patents of the other (RE. 1283). In accordance with the plan, representatives of the two companies visited the respective plants of the other (RE. 1290, 1295). These plant visits went beyond a mere investigation for alleged infringement and covered an exchange of information relating to technical problems or "know how" of the industry (RE. 3651–3731), which was unrelated thereto. For example, DP informed NL in June 1932 that (RE. 3651):

[*] DP kept no records of the negotiation with NL other than those introduced in evidence. It is impossible therefore to tell what Rupprecht had in mind except as his subsequent conduct may throw some light on this statement.

> For conveying barium sulphide solution, most economical service has been had from a five-ply water hose furnished by Sibley Hose and Rubber Company. Two-and one-half-inch hose is used mostly for pressure lines. There is in service now a test section of "Newtype Cord Suction Hose" furnished by Sibley Hose and Rubber Company which is proving very satisfactory for gravity flow lines where ordinary hoses collapse.

It is also significant that though DP was not producing composite pigments at this time, the inspection of the NL plant by DP covered these operations even though DP had informed NL it did not intend to manufacture composite pigments until it was "free to do so through patent expiration" (RE. 1289–1290). This was a recognition by du Pont that the composite field would be patent free in 1934. The conclusion, therefore, is inescapable that these plant visits were in fact for the purpose of initiating the exchange of technical information before the signing of the agreement therefor.

Further, if the negotiations and subsequent agreement were for the purpose of settling a patent controversy, it would seem that DP would have ascertained who owned the patents alleged to have been infringed by it. That DP was not concerned about such a vital consideration is clear by reference to the patents which NL claimed DP infringed. NL claimed that DP infringed nine

patents (RE. 1297) in the total field of approximately one hundred patents in this industry. DP claimed NL infringed eight of its patents (RE. 1313). A total of seventeen patents therefore constituted the field of the "controversy" which was purportedly settled by the 1933 cross-licensing agreement.* Seven of the nine patents involved were not owned by TP (the party granting the release for infringement) but were in fact owned by Titan A/S (RE. 3743). DP never received a license from this company to use the seven patents alleged to be infringed, nor does the record show that it ever received a release for any alleged past infringement of these seven patents. It is submitted, therefore, that whatever "controversy" might have existed as to seven of the nine patents which it was alleged DP infringed, it was not settled by Exhibit E or any subsequent agreement to which DP was a party.

The failure of DP to concern itself with the legal ownership of the patents which it was charged with infringing was not merely an oversight. One of Rupprecht's advisors in these negotiations specifically directed his attention to the necessity of determining title to the patents involved, in April 1933, when he wrote: "I am also

* The eight DP patents involved will not be considered herein as only NL would be concerned with title to those patents and no claim is made that DP did not own the patents it claimed were infringed by NL. As to any infringement claim based on these patents NL obviously secured a valid release.

assuming, *as I have stated previously*, that you know for a fact that the Titanium Pigment Company owned the various patents under which you desire to obtain licenses * * *" (RE. 1459). [Italics supplied.] Rupprecht merely replied to this note of caution that he had been informed that all of the patents on titanium pigments were owned by the Titanium Pigment Company and not NL (RE. 1461). Thus what should have been of primary concern to the negotiators of a patent-settlement agreement was not even regarded as sufficiently important by Rupprecht to warrant a check of the matter after the question of title had been specifically called to his attention. Such conduct on the part of Rupprecht definitely belies du Pont's contention that these negotiations were conducted at arm's length and that such was in fact DP's relation with NL and the other members of the combination at all times.[8]

It was also decided in this "patent infringement inquiry," that the validity of patents was

[8] Titanium Pigment Company was the NL company that executed the 1933 agreement with Krebs, the DP subsidiary (F. 11, R. 239; F. 10, R. 238).

[9] The two remaining patents which it was alleged DP infringed were of no practical consequence. Number 1,196,031 was issued in 1916 and contained but a single claim and expired on the day the 1933 agreement was executed. DP had concluded in June 1931 that the last of the nine patents (No. 1,338,473) was of doubtful validity and easy to avoid (RE. 1180). DP naturally denied any infringement whatever of the aforesaid nine patents (RE. 1387).

not to be questioned except as a last resort (RE. 1373, 1387). It was even suggested that one of the patents alleged to be infringed might be valid "in respect to the operations of all others than ourselves and the du Pont Company" (RE. 1364) because of the long industrial use of the subject matter by NL prior to the date of the patent. A further consideration bearing upon the claim that Exhibit E was for the purpose of settling a patent controversy, is the fact that DP had made an exhaustive survey of the patent situation in the industry and knew that the patents upon which NL's business was originally founded would expire in 1932 and 1934 and that NL had failed to enforce against CP any claims for patent infringement (Fdgs. 37, 72, R. 248, 279, RE. 1038–9, 1171).

DP and NL negotiated an agreement acceptable to them, herein referred to as Exhibit E (R. 69). Its provisions are summarized in the Statement in the brief for the United States, No. 89, this Term, pp. 26–29. Like the negotiations, the agreement was cast in the form of a settlement of a patent controversy. As stated by the district court in its opinion (R. 214):

> Carefully, they cast the agreement *into the form of a settlement of patent disputes.* The disturbing fact about that instrument is that despite the high professional skill

expended upon it, its terms are, in important respects, so vague that upon the trial, counsel for NL and counsel for DP did not agree upon its meaning. It is clear, and I believe not disputed, *that the 1933 writing is far from the lawyer's ideal of clarity and precision.* The only explanation which the record affords for this unexpected obscurity is contained in a letter from Mr. Beschorman to NL's English associates, that *the vagueness in the writing is deliberate and the product of fear of the anti-trust laws.* [Italics supplied.]

In view of the requirements of Article XIV of the 1920 agreement, it was necessary to secure the approval of NL's foreign associates before the contract could be executed. The German associate of NL, IG, objected to the proposed contract. It stated in a letter to Jebsen, dated June 20, 1933 (R. 1479):

> We have carefully examined how this contract affects the interest-sphere of Titangesellschaft, and it seems to us, that at least one important point in the new contract has not been clearly expressed, namely that Krebs unconditionally have to respect the territory reserved Titangesellschaft in the License Agreement of October 1927 between Titan Co A/S and Titangesellschaft, that is that Krebs—
>
> (a) Shall not themselves manufacture in the territory of Titangesellschaft,
>
> (b) Shall not make deliveries in this territory,

(c) Shall also impose upon their customers a corresponding obligation not to deliver in this territory,

(d) Shall grant sublicenses only to undertakings outside this territory and for use outside of this territory,

(e) Shall strictly observe the same limitation as under (d) also regarding the experiences of which they get knowledge and which originate from Titangesellschaft,

We consider it of the greatest importance to have this point made clear, as otherwise the unbearable situation may arise for the Titangesellschaft, that Krebs compete with Titangesellschaft in the latter's territory, with T. G.'s own patent-rights and experiences which are transmitted to Krebs through Titanium Pigment Company.

The wording of Art. 5 paragr. 2 of the new agreement does not so far quite correspond with (cover) the above-mentioned basic principle, that Krebs shall not grant any licenses within the territory of Titangesellschaft and/or to be made use of for this territory, inasmuch as the term "nonexclusive license" has been used. Further, it would better correspond to the spirit of the agreement between Titangesellschaft and Titan Co A/S, if such licenses were granted Titangesellschaft free of cost, it should then be (es sei denn) that Krebs acknowledge, that also they have to pay to T. G. a corresponding compensation for the use of patent-rights originat-

ing from T. G., as it, according to information from Mr. Beschorman, seems to be intended, without we being able hitherto to find a confirmation of this in the agreement. The above-mentioned basic principle that, according to the spirit of the contract between T. G. and Titan Co A/S, Titangesellschaft should be granted a license free of cost under the Krebs patents, applies also to new inventions as such naturally practically always will result from the experiences resulting from the cooperation Krebs/Titanium Pigment Co/ Titangesellschaft.

We should be obliged if Titanium Pigment Co. could give us a certain reassurance also with regard to these points.

Jebsen of NL discussed the proposed contract with the German company and advised NL by cable dated June 22, 1933, that IG would approve the proposed contract provided DP would "clearly" express "in some form" that it would respect TG's territory (RE. 1482).[10] This message was conveyed to Rupprecht of DP by NL. After several conversations with NL, Rupprecht drafted a reply dated June 28, 1933 (RE. 1483) and delivered it to NL personally. At this time he told

[10] He also wrote NL on June 23 that, "Mr. Weber-Andreae seemed to have a fairly good knowledge of the way of cooperation between du Pont and I. C. I. He considered it, though, necessary to have a clear statement from du Pont about the important points,—not necessarily embodied in the agreement, but for instance by exchange of letters between National Lead Company and du Pont" (RE. 1475).

NL that "it was a selling job for them to make IG realize that they were putting their interests in National Lead's hands, and that they would be well taken care of" (RE. 1486). Rupprecht's letter (Ex. 267, RE. 1483) was as follows:

KREBS PIGMENT & COLOR CORPORATION

Confidential June 28, 1933.

W. C. BESCHORMAN,
Vice Pres., National Lead Company,
111 Broadway, New York City, N. Y.

DEAR MR. BESCHORMAN: We have considered the various points raised by I.G. in their cable to you with the desire, if possible, to comply with its request.

As you are aware, the Anti-Trust Laws of this country definitely prevent this Corporation from making any commitments respecting the territories of Titangesellschaft and Titan, Inc. Further, these several companies are not parties to the Krebs-Titanium Pigment Agreement and so, as to them, we are unable to make any direct commitment. However, since Article II of the Krebs-Titanium Pigment Agreement definitely provides that Krebs is limited both in respect to use and sale to the territories set forth in this Article, we think the result will be eminently satisfactory to your foreign associates. As to controlling the disposition of our products by our customers, we are sure you appreciate the diffi-

culty both from a legal and practical standpoint.

The I. G. request that Krebs grant no sublicenses or technical aid to others in the territories of the foreign companies, is tantamount to obligating Krebs to grant exclusive licenses. The whole agreement, you will recall, for definite reasons, was placed on a non-exclusive basis. Since all licenses received from Krebs under its foreign patents, are subject to negotiation, we believe there will be no difficulty in working out a solution that will be acceptable to all parties; it may well be that such negotiations will result in exclusive licenses to your foreign associates. Naturally, we shall treat technical information in the same manner as our patents.

The present form of our Agreement is the result of much care and thought on the part of both parties. It embodies, as we see it, a practicable working basis for both companies, as well as for your foreign associates.

Very truly yours,

C. H. RUPPRECHT,
President.

CHR:

A letter dated July 12, 1933 (Ex. 271, RE. 1491) was prepared by NL, and shown to (Ex. 271, RE. 1490) and read by Rupprecht before it was sent to IG. This letter read as follows:

July 12, 1933.

I. G. FARBENINDUSTRIE, *Aktiengesellschaft,*
Frankfurt (Main), Grüneburgplats.

DEAR SIRS: Immediately upon receipt of cablegram of June 22nd from Dr. Jebsen,

copy of which is attached, we took the matter up with the Krebs Pigment & Color Corporation, submitting to them a copy of the cable, and take pleasure in handing you copy of their reply under date of June 28th. Careful reading of the Krebs letter will surely indicate to you the spirit in which they are entering into this contract and their efforts to meet your views. We feel that experience will prove that such will be the case.

In regard to the phrase "non-exclusive license" to which you call our attention as occurring in Article 5, Paragraph 2, we have to refer to the United States Anti-Trust Laws which absolutely forbid the granting of exclusive license between two manufacturers in the United States as such a practice would tend to create a monopoly. Therefore, the use of this phrase "non-exclusive license" is simply to comply with the United States Laws and in practice the licenses under each others patents will undoubtedly prove to be, to all intents and purposes, exclusive.

Referring subsequently to the points brought out in your letter of June 20th, under A, B, C, D and E, you will note that the Krebs Company consider themselves limited both as to use, manufacture and selling to the territory granted to them by the agreement. While this agreement does not specifically prevent Krebs from exporting into your territory any products not manufactured under the patents of the Titanium

Pigment Company and its associated companies, it will be a difficult matter to discriminate between such manufacture and manufacture under their patents and maintain close and good cooperation, and the practical effect will be that Krebs will refrain from such export.

As to exports by clients of the Krebs Company, we note that Krebs will use all their efforts to prevent any export outside of their territory which would cause any trouble to you in any way.

In regard to licenses, although non-exclusive licenses are specified throughout the agreement, you will note from the letter of Krebs Company that they are not adverse to granting exclusive licenses in case this may be found desirable by you. Under the practice, as we foresee it, these licenses will be given against a nominal payment except in cases of outstanding development.

We also see your point, that by the exclusive license you have given Titan Co., Inc., which has granted exclusive licenses to the Titanium Pigment Co., Inc., you are not in position to trade with Krebs regarding any American patents belonging to you. However, you may rest assured that your interest in these respects, which are also our own interests in view of our part ownership in the Titangesellschaft, will be fully and completely looked after.

At one time we considered the question of an agreement between the Titangesellschaft and Krebs covering the points in your letter,

but have dropped this idea as we felt that you would be better served to have us look after your interests than to complicate the situation with a separate contract.

The only other point in your letter which we do not believe has been covered is your suggestion that the contract be changed from termination in three years to termination in five years. Frankly, there is no possibility of the contract being terminated at any time that we can foresee, and I am glad that you did not make any especial point of this either in the cable or in your letter of June 20th.

May I add that we certainly appreciate your attitude and the views you have put forward in your letter to Dr. Jebsen and trust that you will not be disappointed in the future by following the lines we have suggested. May we ask further advice from you as to whether the Krebs letter and above make the whole matter satisfactory.

Very truly yours,

Executive Vice President.

Copy to—
Dr. KUHNE
Dr. JEBSEN
Mr. RUPPRECHT
Mr. TASKER, *Vice Chairman, British T. P. Co.*

A copy of this letter to IG was mailed to DP by NL on July 17. It was not found in the DP files (R. 215).

The Rupprecht letter of June 28 and the NL letter of July 12 were sent to IG with an accompanying letter dated July 21 from Jebsen, the foreign manager of NL. This letter (Ex. 274, RE. 1502) was as follows:

July 21, 1933.

DR. H. K HNE:

I enclose copy of my letter of today to I. G. Farbenindustrie Aktiengesellschaft transmitting a letter from Mr. W. C. Beschorman, copy of which also is enclosed, dealing with the various points raised in the letter from I. G. Farbenindustrie of June 20th to me regarding the contemplated agreement between Titanium Pigment Company, Inc. and Krebs Pigment and Color Corporation.

I have met Mr. Rupprecht, President of Krebs Pigment and Color Corporation, who verbally has expressed to me the same views as to the future cooperation which has been expressed by Mr. Beschorman.

Considering the views and interpretations as expressed by Mr: Beschorman, and by Mr. Rupprecht in his letter to Mr. Beschorman, it seems to me that a cooperation can be looked to which will be of important benefits to Titangesellschaft.

It is considered desirable to treat the matter strictly confidential.

At the time NL transmitted the Rupprecht letter to IG, it requested IG to advise NL as to whether the Rupprecht letter and the NL letter made the matter satisfactory (RE. 1498). IG replied on August 7 that it had noted the assurances of both NL and DP that they "will loyally respect the delimitations as regards manufacture, granting of licenses and sale, which are fixed in the agreement between Titan Company and Titangesellschaft," and, "relying on this loyal promise, we renounce on [sic] the formal confirmation of the wishes expressed in our letter of June 20th, 1933, * * *"[11] (RE. 1516, 1479).

[11] DP contends in its brief that the District Judge made a mistake of fact in attributing to DP what it describes as a very damaging phrase, i. e., "that DP will loyally respect the territory of TG." The District Judge did not say that this phrase was found in the letter of June 28 from DP to NL or in the letter of July 12 from NL to IG. He stated that the IG letter of August 7 consenting to the agreement clearly indicated that IG had accepted the letters as an assurance that both NL and DP "will loyally respect" the territory of TG. The Court was obviously referring to the fact that IG had read the two letters and had "discovered" therein the assurances and commitments they had asked for from DP and which DP had obviously intended to convey. The District Judge was obviously placing the phrase in quotes for emphasis as "DP" as such was never mentioned in any of the correspondence, although IG was aware that Krebs was a DP subsidiary. The language referred to by DP was contained in the opinion of the court (R. 218) and any doubt as to the fact that the court was there giving a reasonable construction to the language in the Rupprecht and NL letters is shown by his Finding 73 (R. 288) wherein he stated:

"IG construed the communications to mean that Krebs 'will loyally respect the territorial delimitations as regards manu-

The two NL letters and the Rupprecht letter thus secured the approval of the foreign associates of NL to the 1933 contract which in form did not comply with Article XIV of the 1920 contract.

Rupprecht of DP anticipated and was convinced that his letter and the NL letters would together secure their intended result, that is, the approval of IG to Exhibit E. Rupprecht indicated in a letter of July 25 to the DP Foreign Relations Department *before the actual notice of approval was in fact received from IG* that the DP Foreign Relations Department might proceed to notify the London Office of the Contract, as final approval of the contract by IG was expected any day. Rupprecht expressly stated in this letter that he thought that IG's questions had been "satisfactorily answered" (RE. 1509).[12]

---

facture, granting of licenses and sale, which are fixed in the agreement' between Tinc and TG; and in reliance thereon, withdrew its objections to the agreement/Exhibit E."

[12] In the letter of the DP Foreign Relations Department concerning Exhibit E, to the DP London manager (RE. 1506), the DP Foreign Relations Department pointed out that Exhibit E limited the territory of DP's manufacturing operations to the United States with rights to sell in the United States, Central and South America.

It was also suggested in this letter that the DP London manager advise ICI of the agreement and that CIL may still acquire the Blumenfeld patents in Canada and if they desire to do so, "it is quite possible that further negotiations with NL would result in extending the present arrangement to Canada" (RE. 1508). CIL, in which DP had a 45% interest, was a vehicle for many DP operations in Canada, and it ultimately did enter into a contract with NL whereby CTP

Jebsen described the arrangement entered into between DP and NL and the other producers as a result of these letters and his conversation with Rupprecht in October 1933, in his "Short Outline Regarding the Relations in the Titanium Industry." In this outline he referred to the arrangement between DP and NL and stated: "It is understood that the Krebs Corp. will not manufacture or sell outside the American continent" (RE. 1933). He consistently maintained and asserted this position in his writings (RE. 1953, 3070).

Other evidence also indicates the nature of Rupprecht's assurance or commitment of July 1933. Dr. Blumenfeld had conversations with Rupprecht at that time. He testified that the proposed agreement between the European producers was discussed with Rupprecht and Chase at that time and that the substance of his conversation with Rupprecht about that subject was that DP would not export into the territories of the European producers (R. 790, 791, 821, 827–8, RE. 2063).[11]

was created to handle the Canadian market (RE. 342). CTP acquired the Blumenfeld rights in Canada from LaPorte when it purchased the Canadian business of that company in 1937 (F. 58, R. 269).

It was this DP letter (RE. 1506) which brought forth the comment of its London manager in his letter advising ICI of the American agreement between DP and NL that "we look upon this patent pool as a definite advance in cooperation and the strengthening of both parties' position to the exclusion of outsiders" (RE. 1510).

[11] The cartel agreements between the competing European

The DP letter of June 28 was prepared by Rupprecht and Hanley of the DP legal department and thereafter personally delivered by Rupprecht to the NL representative (RE. 1487) for transmission to the other members of the combine, who held the power to withhold the benefits desired by DP, for the purpose of indicating to them that although DP could not take the oath, in the form required, it would nevertheless be a most satisfactory member. As we have seen, the letter stated, "* * * we are unable to make any *direct* commitments. However, * * * we think the result will be eminently satisfactory to your foreign associates" (RE. 1483). [Italics supplied.] The clear implica-

---

producers were consummated shortly *after* the approval and execution of Exhibit E as contemplated in the March 1931 Conference. These agreements were executed as follows:

Ex. G (RE. 178), Nov. 23, 1933.
G-1 (RE. 197), June 17, 1935, Effective as of May 1, 1934.
G-2 (RE. 221), June 17, 1935, Effective as of May 1, 1934.
G-3 (RE. 233), June 17, 1935, Effective as of May 1, 1934.
F-8 (RE. 178), Sept. 1941.

The District Court found that these agreements had the intended effect of preventing any exports of titanium pigments to the United States (F. 68, R. 277). The Japanese and Canadian markets were also organized by the combine *after* Exhibit E was approved and executed. (Japan—RE. 292-341; January 1936; Canada—RE. 342-394, January 1937).

tion was that an indirect commitment was being undertaken, and this was confirmed by the DP-approved NL letter to IG. That was the only way it could have been done, as DP had no contract relations with IG, and to have placed a provision satisfactory to IG in Exhibit E would have made the contract illegal on its face and would have rendered the whole pooling arrangement between DP and NL in the United States clearly illegal. The record does not disclose what was said by Rupprecht at the time he delivered the letter to NL.[14]

Rupprecht knew that his letter was to be used to secure IG's consent to Exhibit E and indicated to

[14] Rupprecht died September 1944. The NL representative Beschorman was incapable of testifying at the trial. Hanley, who has been the head of the Foreign Relations Department of DP since 1940, was not called as a witness by DP to throw any light on the letter or any conversation he had with Rupprecht of DP at the time of its preparation. E. C. Thompson, director of Krebs, and since April 1942 general manager of the Grasselli Chemical Department of DP (RE. 585) and with whom Rupprecht had also discussed the IG request for expressions "by Krebs in some form that they will respect Titangesellschaft's territory" (RE. 1485) was also not called by DP as a witness to offer such explanation of the contents or the purpose of the letter as he might offer. Wm. Richter, another director of Krebs, to whom Rupprecht also sent a blind copy of the letter of June 28 (RE. 1485, RE. 584) was also not called as a witness by DP. The failure of DP to call such officers or employees as witnesses to aid the court in construing Rupprecht's ambiguous conduct and letter, justifies the conclusion that their testimony, if given, would have placed a construction on such ambiguous conduct or actions of the defendant unfavorable to the defendant's claim. *Interstate Circuit* v. *United States*, 306 U. S. 208.

NL that it could also assure IG that its interests "would be well taken care of" by NL (RE. 1485). DP therefore placed in the possession of NL an instrument of assurance which it knew was necessarily ambiguous in content and in addition thereto and in order to make doubly certain that the proper reply would be conveyed to IG, had authorized NL to assure IG that NL would look after IG's interests.

Armed with this authority which was apparently given in the several conversations which Rupprecht had with NL which are referred to in the Rupprecht letter to Thompson (RE. 1485), NL proceeded to amplify the Rupprecht letter of June 28 by its letter to IG dated July 12, set forth *supra*, pp. 24–27. This NL letter was obviously intended to clear up any ambiguities in the Rupprecht letter and fully to satisfy the IG request that DP "indicate in some form" that it would fully respect TG's territory. A copy of this letter was read by Rupprecht in NL's office and mailed to DP for its records (RE. 1490). DP therefore clearly knew about the NL letter of July 12, although a copy of it was never found in the DP files or records. Such knowledge is significant, and the inference to be drawn therefrom is an inescapable admission of guilt as to the intent and purpose of DP to commit itself to respect the territories of the foreign producers of NL.

NL was thus authorized by DP to vouch for its future conduct as being eminently satisfactory to

IG. The manner of taking the "obligation" was different from the written form required by the provisions of the 1920 agreement. There was, however, no doubt in the minds of the other members of the combination or in the mind of NL, the DP sponsor, that DP would respect the fundamental obligation of the members of the combine to each other and would not transgress their exclusive territorial rights. That DP was in fact a most satisfactory member appears from the statement of Jebsen of NL in 1940 that

> The cooperation with du Pont, as far as the European associates are concerned, has, however, been satisfactory in the years passed * * * (RE. 1956).

The record shows that whatever the DP policy may have been with reference to selling in foreign markets[15] it never did sell or export into the territories of other members of the combine. It did open up its know-how to them.[16] It did make

[15] Rupprecht indicated in February 1933 that DP had always been doing some export business and had shipped titanated lithopone to England and that DP had an office in Buenos Aires and one or more offices in Japan and China (RE. 1428). The Government contends that this indicates that DP's argument that it was not its policy to export is a specious one.

[16] There was no provision in Exhibit E for the granting or exchange of know-how for the foreign associates of NL. DP thus went outside the contract in this respect and did so immediately after the approval of Exhibit E by the foreign associates of NL. The Government contends this was a recognition by DP of a commitment by DP to "cooperate" with the combine, and evidences the existence of an "understand-

its patents and patent applications available to them on a royalty-free basis. In return it received the benefits of membership in the combine—an U. S. market free from any foreign competition, the know-how of the foreign associates of NL and access to their patents and patent applications on a royalty-free basis. What more could a full-fledged member give or receive?"

---

ing" outside the provisions of Exhibit E between DP and the other members of the combine.

"DP suggests in its brief that Exhibit E was approved by the foreign associates of NL, including BTP, before its actual execution, and urges this as evidence that its action did not beget the approval of Exhibit E. The record shows the contrary to be true, as BTP approved Exhibit E on July 29 *on the basis of the DP letter of June 28 and the NL letter of July 12 to IG* (RE. 1984).

DP also argues at length in its brief that the court misconstrued its letter of June 28 to NL and that it merely put over a "clever business deal" with NL, its foreign associates and the Blumenfeld companies. The record belies this construction.

DP argues at length in its brief that Jebsen's oral testimony indicates that he was never able to get an agreement from Rupprecht in compliance with the requirements of the 1920 contract. It is, of course, not in dispute that DP did not express itself in writing to that effect for obvious reasons. Jebsen, a devotee of the written word, would have much preferred to have Rupprecht express himself in the clear and unequivocal language of the 1920 agreement, and would have been fully satisfied with no less (R. 1043). That Dr. Jebsen, a Norwegian, did not understand "a gentlemen's agreement" is shown by Dr. Thompson's statement as follows: "It appears to me that Dr. Jebsen cannot appreciate that a friendly and cordial relation with Krebs would take the place of specific legal obligations." (RE. 1443.) His testi-

5. The cooperation between DP and the members of the combination after the 1933 DP–NL contract clearly shows membership in and cooperation with the combine

The attitude of DP after the approval and execution of Exhibit E in 1933 toward the members of the combine and new risk capital entering the industry reflect DP's status with the combine. It cooperated with the foreign members of the combine in making its patents and know how available to them on a reciprocal basis and did not compete with them in their respective exclusive territories. Such conduct is more consistent with membership than nonmembership. Such conduct is particularly persuasive as indicating membership since DP did discriminate against new risk capital attempting to enter the industry.

It has already been shown that the European cartel agreements were made possible and were entered into after the 1933 agreement, between DP and NL, as approved by the foreign associates of NL, had been executed. It has also been shown that the Japanese and Canadian markets were

---

mony on the trial—13 years after the approval of Exhibit E by IG, is in some respects in apposition to his written expressions as to the arrangement between DP and the foreign associates of NL previously referred to on page 31. To the extent that his oral testimony may be at variance with his written expression, it is submitted that the contemporaneous written expression of his understanding of the arrangement between DP and the other producers of titanium pigments is clearly the best evidence of that understanding.

completely organized by the combine *after* the '33 agreement. The complete elimination of all competitors in the Canadian market in 1937 and the joint control of that market by the Canadian vehicle of DP (CIL) and its American contract party NL amply protected the U. S. market and of course DP from any possible threat of competition from its closest potential competitor.

6. DP cooperated with foreign producers and members of the combine by exchanging "know how" with them

The record shows that the relations between DP and the foreign members of the combination after 1933 were those of cooperative members of the combine. DP permitted representatives of the foreign producers to visit their plants and secure the DP know-how. Raspe of TG visited the DP plant immediately after IG and TG had given their approval to the 1933 agreement.[18] In November 1933 Dr. Raspe was "spending all of his time in the Krebs plant learning all that they

[18] The Government contends that this is significant evidence that DP was giving the combine and its members its full cooperation, for if DP had no understanding with the foreign producers and had not joined the combination and was in fact a competitor, either actual or potential, of the combine, as argued by DP, it would not have permitted TG to have access to its plant know-how in the absence of an understanding "*in some form*" that it was not going to compete.

have therein" (RE. 1540). Dr. Kuhne of TG was likewise permitted to visit the DP titanium plants (RE. 1853). DP enjoyed similar privileges from the foreign producers. Dr. Booge of DP visited the plants of both the German and British companies in 1937 (RE. 1849). The know-how of DP was, therefore, directly available to the foreign associates of NL until the exchange of all technical information and experience between DP and NL was terminated in May 1940 (RE. 1841–1855, 1990, 3009). NL and DP also extensively exchanged know-how during this period (RE. 1841–1942, R. 903–4), thus aiding each other to establish their domestic market positions against any potential or actual domestic competition. This DP aid to the foreign producers was, of course, of comparable benefit to them in their respective exclusive territories.

Plant visits were denied members of the Blumenfeld companies by DP in 1938 (RE. 1861). This definitely disproves the DP contention that the "know-how" exchanged between DP and the other producers was available to anyone in the industry. The record fails to show that DP ever made its "know-how" available to anyone except NL and its foreign associates who had approved the 1933 agreement on the basis of the DP letter of June 28, 1933, and the NL letter accompanying it.

7. DP exchanged patents and patent applications with foreign producers on a royalty-free basis pursuant to an oral understanding

The patents and *patent applications* of the foreign associates of NL were likewise available to DP on a royalty-free basis after it had joined the combination in 1933, a fact which further shows DP's cooperation with the combine. Article V of the 1933 agreement gave NL's foreign associates the first rights to secure licenses on any foreign patents relating to the manufacture or use of titanium pigments which DP might secure in the territory of such foreign associates. DP, on the other hand, through NL, was entitled to similar rights on the foreign associates' patents in the United States. The basis under which these rights could be reduced to license form was left to negotiation under the 1933 contract.

The foreign associates of NL desired a general arrangement covering the exchange of patents between DP and themselves in order to eliminate the details of negotiating licenses under specific patents as required by Article V of Exhibit E (RE. 2989–3059). The District Court found that DP refused to make a *written*[19] general agreement for the

[19] DP also carefully refrained from keeping any written memoranda regarding the conferences in which the oral understanding was worked out. Rupprecht suggested to the Tinc representative, Kaegebehn, that he should not keep any written records of the conferences. Kaegebehn testified, "I recall Mr. Rupprecht cautioning me not to keep any

exchange of licenses on present and future patents with NL's foreign associates. As in the 1933 negotiations, they gave as their reason for refusing that such an agreement would be in violation of the antitrust laws (F. 89, R. 300). The District Court found, however, that DP did enter into an oral understanding with the foreign associates of NL whereby each of the parties agreed to exchange such of its patents and applications within the licensed field, as defined in the 1933 agreement, as might be desired by each from the other (F. 89, R. 301). Under the oral understanding such patents and applications as were desired by each were to be licensed to the other on a *royalty free basis* in separate annual license agreements. These licenses were to be exclusive except as to DP and in England as to ICI, but DP expressed the view that the reservation was without practical importance (F. 89, R. 300). The reservations were never utilized, so the licenses granted by DP were exclusive in fact as Rupprecht indicated they would be in his letter of June 28, 1933. He stated (RE. 1484):

> The whole agreement, you will recall, for definite reasons, was placed on a non exclusive basis * * * we believe there will be no difficulty in working out a solution that will be acceptable to all parties. It may well be that such negotiations will

notes on my conferences during 1937 and 1938" (R. 778). Although DP was subpoenaed to produce any memorandum concerning these negotiations, DP produced none (R. 781).

result in exclusive licenses to your foreign associates.[20]

The district court found that acting in accordance with the oral understanding, royalty-free licenses were exchanged between DP and NL's foreign associates in 1939, 1940, and 1941 and no licenses under the applications of NL's foreign associates were granted to any other producers in the United States except NL and DP (F. 90, R. 302).[21]

[20] That the DP patents which it made available to the foreign associates of NL were exclusive in practice cannot be lightly dismissed by DP. The DP argument that the oral understanding of 1938 was of no consequence is not sustained by the record when viewed in the light of the relationship between DP and other members of the combination *after* the 1933 agreement. The exchange of patents and patent applications between DP and the foreign members of the combination was obviously of definite value in furthering the objects and purposes of the combination throughout the rest of the world. On the other hand, the availability of the "know how" and patents of NL's foreign associates to DP was of inestimable value to it in enabling DP together with NL to secure, maintain, and guarantee their market position in the United States against all actual or potential competition.

[21] The existence of an oral understanding in which DP participated is another example of the cooperation between DP and the members of the combination *and of the form in which it was arranged for.* The cooperation necessarily could stem only from membership in the combination as cooperation does not generally exist between *bona fide* competitors in the absence of some kind of general understanding between them.

The licenses granted under the oral understanding were of great value to DP as 35% of its TiO_2 sales in 1941 were covered by licenses granted to DP by Tinc in 1941 (RE. 486, 3201, 3206). Since NL had to approve these licenses (F. 89, R. 301), it is hardly likely NL would have been thus aiding a competitor by giving its approval, if any competition likely to result therefrom might affect the price structure.

Under this oral arrangement DP deferred the inclusion of certain applications and patents in specific license agreements until it desired such application or patents to be included in certain cross licenses (RE. 3112, 3118, 3126, 3131). The patents and applications so deferred were, however, available to DP at all times for use even though not licensed. Among the patents and applications so deferred, but available to DP, were the Rutile pigment applications available to DP from June 1938, but not licensed to it until May 10, 1940 (RE. 3118, 3089).[*] The Government submits that such action of DP in thus selecting certain applications and patents for specific license agreements, although available to it at any time,

[*] The Rutile patents were Nos. 2,303,305, 2,303,306, and 2,303,307. In connection with these patents DP assured NL and its foreign associates in November 1938 that before it filed its patent application relating to the manufacture of Rutile it would consult with the representatives of NL's foreign associates in order to avoid interference proceedings with the Rutile pigment applications of NL's foreign associates (RE. 3089, 3096, 3097).

could only have been intended to make the licenses appear legal and to have been individually negotiated as distinct and separate transactions apart from the oral understanding pursuant to which they were actually made.

8. The DP foreign patents were used to prevent imports into the United States

It is also significant that the DP foreign patents were only sublicensed by NL's foreign associates if the sublicensee agreed not to export from the territory of the foreign associate (RE. 3148). Such action clearly shows that the DP foreign patents, which were made available to the foreign producers under the oral understanding of 1938, were used not only to protect the territories allocated to the producers under the various agreements but also to protect the United States market, and of course DP, from foreign competition. DP imposed a comparable restriction on the exportation by domestic purchasers of titanium pigments manufactured under patents licensed in the 1940 and 1941 DP–Tinc cross-licensing agreements (Exs. R and S, RE. 470–486). These cross licensing agreements provided for and were intended to restrict, the use and export by purchasers of titanium pigments manufactured under any of these patents (RE. 3132–

3139).[23] DP thus extended reciprocal protection to the foreign producers in these agreements.

It is accordingly submitted that commercial and technical relations between DP and NL as well as between DP and NL's foreign associates were on a most friendly and cooperative basis after Exhibit E was approved and executed. DP did exchange "know-how" with members of the combine. DP exchanged its patents and patent applications with NL pursuant to the 1933 agreement, and with its foreign associates pursuant to an oral understanding. Previous to the oral understanding of 1938 it had expressed its good will in a one-way royalty free license agreement of certain DP foreign patents (Ex. M, RE. 406). Such cooperation can hardly be said to be consistent with arm's length relations between actual or potential competitors. It could only result from membership in the combine.

9. The relations between DP and Zirconium and V. C.

It has been previously pointed out (*supra*, p. 19) that there was extreme doubt concerning the validity of many of the patents involved in this industry. The validity of none of these patents has ever been questioned in any court any-

[23] Mr. Hancock of the DP patent staff did not endeavor otherwise to explain or repudiate these restrictions nor did he testify concerning the 1938 understanding between DP and NL and NL foreign associates in which he participated (RE. 3077).

where in the world. That patents of doubtful validity may be a very effective weapon to suppress or deter potential competition, particularly in the hands of a corporation with vast financial resources, is obvious.

DP was not averse to using patents as a weapon. In December 1932, Rupprecht recognized that, of the four Auer patents owned by DP, "there was only one that we consider to be of any real value and even that is doubtful" (RE. 1585).[24] In 1933, he referred to the possibility that another Auer patent "might be a very valuable weapon in our hands" (RE. 1587).

In the license negotiations between DP and Zirconium in 1934 the record shows that Zirconium relied on the early Barton and Weintraub expired patents as prior art in opposing DP's claims of alleged infringement (RE. 4258). In these negotiations DP asserted Blumenfeld # 1504669 against Zirconium. This is one of the patents DP felt could be avoided or proved invalid before it acquired the patent with the assets of CP in 1931 and when it was in the same position as Zirconium was in 1934 (RE. 1029). DP also cited 1795467 (reissue 18854) against Zirconium (RE. 4263). This is one of the patents NL had stated might be valid "in respect to the operation of all others than ourselves and the du Pont Company" (RE. 1364, 1366). DP also cited 1633621

[24] The district court found the Auer patents were not of much consequence (F. 38, R. 249).

against Zirconium who argued that prior art anticipated this patent (RE. 4259). NL was of the same opinion in 1932 when it was asserted against it by DP, for it stated then that "It is well known that such solutions have been used since the manufacture of titanium pigments were placed on a commercial basis" (RE. 1356, 1365).

In view of the foregoing it is no wonder that Zirconium felt the industry was substantially patent free in 1934 (as Barton suggested it would be in 1932 (RE. 1249)), and advised NL in its negotiations with it that (RE. 1659):

> Many of these patents are very questionable where there is any invention involved due to the prior art and knowledge already existing. Of course, questions pertaining to the validity of these patents could only be settled by court action. Unfortunately there has been no litigation involving titanium oxide processes, and the validity of these patents has never been tested out in court.

DP admitted that it had no proof of patent infringement at the time Zirconium decided to accept a restricted license from DP on a royalty basis without "know how" and access to its future patents and applications on an exchange basis. The Executive Committee of DP advised the finance committee on July 18, 1935, that although it believed Zirconium has infringed some of the DP patents " * * * no proof is available, and it would be necessary to institute court inter-

rogatory proceedings against American Zirconium Corporation to develop definite proof" (RE. 1690).

DP restricted the production of its licensees, Zirconium and V. C., and to that extent restricted their capacity to compete not only with itself but also with N. L. The district court found that the DP licensees to Zirconium and V. C. had the necessary effect of restricting competition (Fs. 95–96, R. 304; F. 84, R. 296–7).

The restrictions which DP imposed on the productive capacity of Zirconium and V. C. effectively restrained and prevented them from increasing their productive capacity to a point where they could give DP any competition in either production or price. The DP restrictions not only prevented the development of the licensees as competition in the pure titanium dioxide field but also operated to prevent them from entering the composite pigment field. The restrictions imposed by DP were, therefore, of direct benefit to NL also. The licensees required Zirconium and V. C. to pay a royalty on all titanium dioxide irrespective of whether produced under the DP patents (F. 84, R. 295), and thus further restricted the ability of the licensees to compete by increasing their production costs through royalty payments.[25]

[25] The Government, in answer to DP's contention that the restrictions in the license agreements with Zirconium and FC are legal, contends that, as a matter of law, the quantity restrictions on production were illegal *per se* under the Sher-

DP refused to exchange future patents with Zirconium in its license with that company, although Zirconium had requested such a provision in the license. DP replied to the Zirconium request, "relative to your suggestion that provision be made to have our license include rights under any of our future patents in the titanium dioxide pigment field, and that we would also be granted rights under any of your patents now issued or which may be issued, we regret that this is not of interest or acceptable to us * * *, we are sorry that any blanket allowance rights under future patents cannot be considered by us * * *" (RE. 1674). It is submitted that the DP conduct in refusing the Zirconium request for a cross licensing agreement of future patents *comparable to that between DP and NL* shows discrimination by DP and its conduct is in sharp contrast and in direct opposition to its conduct and patent policy toward the other members of the combination. This refusal of DP answers their repeated contention that their license agreements promoted

---

man Act. Restrictions in excess of the monopoly covered by a patent grant imposed on a license are illegal *per se* as a patent affords no immunity for a monopoly not within the grant. *Ethyl Gasoline Corporation* v. *United States*, 309 U. S. 436. The use of a patent grant to suppress competition in the sale of an unpatented article is unlawful. *Morton Salt Co.* v. *Suppiger Co.*, 314 U. S. 489.

The attempt of Du Pont to restrict the quantity of the unpatented products which the licensees could produce under the licensed process patents is beyond the limits of the patent grant and as such *per se* illegal. *American Equip. Co.* v. *Tuthill Building Material Corp.*, 69 F. 2d 406 (C. C. A. 7).

rather than restrained competition in this industry and shows that, although Zirconium took a license from DP, it did not get and could not get the kind of license it wanted.

The distinction between the Zirconium license and its license with NL is that the Zirconium license "* * * does not call for any exchange of information, know-how or *future developments* and is confined entirely to Krebs present issued patents in the pure titanium dioxide field" (Re. 1690).

It should be observed that DP admitted in 1940 that the frequent visits of NL to the DP plants resulted in bringing down NL's manufacturing cost to somewhere near the DP level (RE. 4317). No such privileges were, of course, accorded Zirconium and VC. They were thus deprived of the same ability to compete with DP as DP indicates was available to NL. This evidence further shows the value of "know-how" in this industry.

The record, therefore, clearly answers the DP contention that its treatment of the licensees, Zirconium and V. C., promoted rather than restrained competition, since DP refused to give them the same consideration that was given the members of the combination with whom DP says it had no arrangement,[26] and of which it contends

[26] DP even gave the foreign producers a royalty-free license on one of its foreign patents in 1937 for merely paying the upkeep costs on the patent (RE. 406).

it was not a member. If DP was not a member of the combination, as it contends, what reasonable and plausible explanation can it give for its sharply different and contrasting treatment between NL and the non-conspirator American producers? The fact that DP restricted the capacity of Zirconium and V. C. to compete in the pure TiO_2 field and excluded them from the composite field by limiting their productive capacity at a time when DP and NL were strengthening and establishing their market positions in both fields by increasing their plant capacities by additional construction as fast as possible, is reconcilable and consistent only with a finding of membership in the combination. Further the record is replete with evidence to the effect that DP's principal problem at the time the licenses were granted and while the restrictions were effective[11] was to find ways and means to construct and increase its plant capacity to a point where it could meet the increasing market demand for titanium pigment products. (R. 4396 and exhibits attached, R. 1162–1165).

DP admitted that as production increases the cost of production will ordinarily be reduced proportionately (R. 1171). It is submitted that the restrictions imposed by DP and its licensees were a most effective way of preventing them from

[11] DP cancelled all restrictions on the productive capacity of its restricted licenses in November 1944 after the instant case was filed and before trial (F. 85, R. 297).

ever reaching a position in this industry where they might be regarded as even potential competition to either DP or NL. It should not be overlooked that the industry was maturing while these restrictions were in effect and that DP as well as NL were establishing their market positions with the users of titanium pigments during this period. The fact that DP had over 80 research chemists working in this field alone (R. 1160) shows the importance which DP attached to this industry. It should require no extended argument to support the contention that the restricted licensees necessarily had no incentive to develop products through research in this industry when their production was so restricted that any developments would be of little import to them from a practical point of view."

---

[28] DP argues that its restrictions were of no effect in restraining competition and contends that it frequently waived the production restrictions. The record shows that this magnanimity on the part of DP, amounted merely to the granting of permission to the licensees to lump their carry-over production in cases where they had not realized the maximum production allowed in any one year. Even then the DP permission was reluctantly given to Zirconium and Rupprecht wrote its licensee "* * * we must ask that in the future you strictly adhere to the maximum quantities specified in the contract" (RE. 1707). Management is obviously restricted in planning an efficient production and marketing program when it knows it cannot produce in excess of a stipulated quantity of the product it manufactures. The DP vice was in restricting the production of its licensees while it and NL were securely establishing their own manufacturing and marketing position in the industry, so they

It is accordingly submitted that the action of DP in imposing the restrictive provisions upon its two licensees, V. C. and Zirconium, definitely prevented the development of even any potential competition from these companies and prevented and still prevents them from effectively attacking the position of dominance enjoyed in the titanium pigment market today by both DP and NL. That DP and NL do enjoy a dominant position in the market cannot be denied. Together they produce 100% of the composite pigment and approximately 90% of the pure pigment sold in the American market. The position of dominance in the American market which DP and NL now enjoy is the result of their illegal action in combining together as well as cooperating with the other producers of titanium pigments throughout the world for the purpose and with the necessary effect of restraining foreign as well as domestic trade and commerce in this industry.

10. DP respected the territories of the foreign producers

DP admits that it did not export into the territories of the foreign members of the combine. It argues, however, that this is not to be con-

---

could effectively dominate and control the price structure. Zirconium allowed 36,000 1935 through 1941, producing 29,676; VC allowed 23,500 Oct. 1937 to Dec. 31, 1941, producing 17,733. NL expressed the view in 1940 that a production of 10,000 tons a year was necessary for anyone to operate a new plant in this industry on a profitable basis. (RE. 3642).

strued as evidence that it made a commitment with the members of the combine to respect those territories.

It first contends that for business reasons it was not the policy of DP to export. This contention was lightly regarded by the district court for the reasons stated in its opinion (R. 217). In February, 1933, DP had no policy against exporting [29] (RE. 1428). DP then contends that it never had any products to export and that its productive capacity was always behind the market in the United States. This argument is specious. The undisputed facts show that DP did in fact export titanium pigments to every country in the Western Hemisphere (RE. 537–551). In addition, we

[29] NL wrote Jebsen, its foreign representative, in February 1933, that, "We have practically made up our minds that unless the Krebs Corporation in back of DP will agree not to sell for export out of the United States our cross license system cannot go into effect" (RE. 1422). DP objected to this because Rupprecht "said *they have always been doing some export business.* They have shipped titanite lithopone to England, have an office in Buenos Aires and one or more offices in Japan and China. He did not think they would want to accept the restriction proposed. He said that the legal department advised him that as long as this was a cross licensing agreement between two United States companies any restriction of territory might be considered in violation of law" (RE. 1428).

The record contains evidence of exports of American purchases of titanium pigments to markets in Asia and the policing of such exports by NL (RE. 3319–3329). The fact that such exports could be profitably made by purchasers of titanium pigments in the United States shows a manufacturer of the product such as DP could have sold in Asiatic and other markets at a profit.

submit that it cannot be argued, in view of the background and other evidence in this case, that it is a mere coincidence that DP's export market was in fact the same as that allocated to its contract partner and co-defendant NL under the 1920 agreement.

DP then contends that its failure to export is explained on the ground that the foreign patent situation prevented such exports. There are three answers to this attempted explanation: (1) The basic titanium patents expired in England in 1933 (RE. 791); (2) there are many countries in the territory of the foreign members of the combine in which there were no patents;[30] and (3) it is obvious that this argument did not prevent DP from exporting into the Canadian market even though it had no patents in that country (RE. 437).

The fact that it did not export to the exclusive territories of the foreign members of the combine cannot be lightly disregarded or explained on the grounds of DP business policy or foreign patent protection. We again submit that the record clearly supports a finding that DP joined the combination and made a commitment to respect the exclusive territories of the foreign producers whether it was in the form of assurances as found by the district court or by a tacit or oral understanding to that effect.

---

[30] TG's territory, for example, included most of Europe and Asia (Ex. C–Cp, incl., RE. 46–87).

The DP attempt to explain their failure to compete in the territories of the foreign producers also falls in view of the recognition of such an understanding on the part of Rupprecht in 1936. He advised the president of NL in March 1936, by telephone that DP was filling a small order for export to England but "was inclined to send it as a sample, no charge; not wanting to have any question raised about their selling outside of the United States." This statement would have been unnecessary if there had been no understanding that DP was not to export (RE. 3300, F. 73, R. 289). The documentary evidence as to this in NL's files also shows what the 1933 negotiations made obvious, namely, that Rupprecht preferred oral understandings and conversations rather than written ones if the arrangement or conversation was likely to reflect a violation of the antitrust laws.

It is accordingly submitted that such evidence, together with the written summary of the titanium industry, as made by Jebsen in October, 1933,[11] and the oral understanding of 1938 cannot be likely dismissed by DP on the grounds urged in their brief. The evidence amply supports the district court's finding that a necessary effect

[11] In this summary Jebsen wrote, "It is understood that the Krebs Corps will not manufacture or sell outside the American Continent" (RE. 1533).

of the agreements and understandings it found to exist between DP and the other defendants and co-conspirators, was that DP refrained from exporting titanium pigments outside the Western Hemisphere and has refrained from competing outside the Western Hemisphere with any of its co-conspirators in their respective exclusive territories (F. 95–2, R. 304). The relations between DP and the other members of the combination *after* the 1933 contract, together with the specific evidence before discussed, adequately and substantially sustained the ultimate finding of fact that DP joined the combination.

11. Any competition existing in the titanium pigment industry in the United States is a co-operative competition between DP and NL and does not affect price

DP suggests that the 1933 contract promoted competition in the industry and relies on F. 78, R. 290, to support its contention. This finding cannot of course be isolated and read apart from the other findings and opinion of the court which are definitely adverse to DP.

It should be noted at the outset that DP produces many types of titanium pigments which are not produced by NL and which are therefore not in competition with NL products.[*]

[*] DP sells about 40 different kinds of titanium pigments (R. 1153). NL does not sell any titanium pigment which is

Further, price stability has existed and has been maintained in the American market since the 1933 agreement (F. 95, R. 304). Neither DP nor NL have any records showing the manner or method of arriving at its price lists (R. 1148), and DP purports not to know its exact costs (RE. 4317). Although the NL and DP productive capacity and the production in this industry have increased tenfold since the 1933 agreement, prices have only decreased from 17¢ a pound in 1933 to a low of 13¢ a pound in 1940 to 14½¢ per pound in 1941. The interest of DP in maintaining a high price for titanium pigments in order to protect its lithopone business was the principal reason for DP entering the titanium pigment business. The interest of DP in operating its lithopone plants on a profitable basis plus NL's natural desire to avoid price competition and the total lack of any actual or threatened competition from foreign or domestic producers necessarily operated to stabilize the price at which titanium pigments were sold in the United States.[32] The competition of VC and Zirconium, which DP's sales director of six weeks

---

the commercial equivalent of 22 of these 40, and DP does not sell the commercial equivalent of three of NL's products (R. 1149).

[32] In 1931 representatives of DP stated to NL that "they had to keep at least a 2¢ a pound margin between the price of titanox and lithopone and, therefore, if we (NL) reduced the price of our titanium they would have to reduce the price of lithopone" (RE. 1067).

(R. 1152) called "tough", plainly was not sufficient to undermine the price structure. Both of these companies were themselves purchasers of titanium pigments from NL and DP, and together, undoubtedly as a result of restrictions imposed by the defendants upon their output, could only produce less than 10% of the total United States production of pure titanium pigments and no composite pigments whatever. While it is true, therefore, as claimed by DP, that the complaint in the instant case does not charge price fixing, one of the necessary effects of the 1933 and other agreements has been, as found by the court, to maintain and stabilize prices in this industry. Both DP and NL had obvious reasons, supported by the record, to maintain price stability and avoid price competition.

12. The district court properly held that du Pont had joined the conspiracy

Substantially all of DP's assignments of error are based on the contention that it was not a member of the conspiracy found by the lower court. The district court stated succinctly in its opinion the problem of DuPont's participation in the cartel as follows (RE. 213):

> The question is whether it [DP] succeeded in avoiding not only the form but also the substance of transgression.

The lower court, after painstaking review of the evidence, concluded that du Pont had not

avoided the substance of a violation of the anti-trust laws.

Defendant du Pont in its brief (pp. 53–63) has argued, somewhat ingeniously, that the form of transgression is lacking since no agreement to join the cartel was found by the lower court, but carefully avoids the lower court's findings relating to the substance of the violation. By careful excision of the district court's findings, defendant du Pont attempts to present a picture of unilateral action by du Pont which has been construed by the district court as the product of conspiracy (see pp. 54–55 of defendant du Pont's brief). A fuller quotation from the findings gives a more complete picture (R. 292–293):

> There is no evidence that Rupprecht remonstrated against the sending of Beschorman's letter to I. G. Krebs, and DP through Rupprecht acquiesced in and ratified the assurance made by Beschorman to IG as to territorial delimitations of the titanium pigment business. In acquiescing in such assurance that DP would not manufacture in or sell in TG's territory, DP was not making a promise; it was doing no more than giving expression to its then existing policy not to manufacture or sell in Germany and other TG territory. DP's aforesaid assurance in part formed the consideration for continued abstinence of the European producers from exporting to the United States.

IG construed the communications to mean that Krebs will loyally respect the territorial delimitations as regards manufacture, granting of licenses and sale, which are fixed in the agreement between Tinc and TG; and in reliance thereon, withdrew its objections to the agreement Exhibit E. There is no evidence that the aforesaid construction was communicated to DP.

DP did not agree with TP or NL that it would refrain from exporting titanium pigments into TG's territory; but it assured TP and NL that, as a practical matter, such exports would not take place.

DP did not agree with TP or NL that it would grant NL's foreign associates exclusive licenses under DP's foreign patents; but it gave assurances that the practical effect of its conduct would produce substantially identical results as if it did so agree.

Tinc and NL's other foreign associates approved the agreement between TP and Krebs on the basis of the DP assurances.

NL agreed with DP that all of NL's titanium pigment business would be done exclusively through TP, and DP agreed with NL that it would only engage in the titanium pigment business through Krebs. The conduct of DP of its titanium business after January 1, 1936 through the Krebs Division of DP did not breach or violate this agreement or any assurances previously given by DP through Krebs.

DP, through Rupprecht and Krebs, by these assurances *and Exhibit E,* joined the conspiracy found herein to exist between NL and its associates. DP's status, rights and obligations were different from those of the other members of the combination. DP did not thereafter withdraw. [RE. 287–289.] [Italics supplied.]

The necessary effects of the agreement Exhibit E and of DP assurances have been—

* * * * * *

(3) To give NL and DP together domination and control over the titanium pigment business in the United States.

(4) To remove obstacles from the execution of the TG-Aussig agreement—Ex. G, the Blumenfeld agreements G–1, G–2, G–3, the Japanese agreement Ex. J, the Canadian agreement Ex. K and the price agreement between BTP and Laporte for the British Empire.

(6) To restrict and obstruct exports from the United States outside of the Western Hemisphere.

(7) To restrict and obstruct imports into the United States. [R. 292–3.]

A reading of Finding 73 (R. 280–289) demonstrates that the lower court used the word "assurances"[34] not to denote that there was no under-

[34] Webster's New International Dictionary, Second Edition, "Assurance—Act of assuring, as by personal engagement; a pledge or guarantee; also, a declaration tending to inspire full confidence."

standing or meeting of the minds between du Pont and the other conspirators, but merely that du Pont had not made binding commitments or contracts which the other conspirators could enforce against it. du Pont's argument that the court erred in finding that it joined the conspirators resolves itself into the contention that because the lower court did not find agreement by du Pont to refrain from exporting and to grant exclusive licenses to NL's foreign associates, a finding by the court that du Pont in fact joined the conspiracy must be error. This hypothetical argument ignores the concrete results of the agreement embodied in Exhibit E that in fact du Pont gave assurance [25] that it would not export to or manufacture in various foreign countries, knowing that the foreign conspirators would not import into or manufacture in the United States; that in fact DP thereafter did not export to the exclusive territories of the foreign producers and gave licenses exclusive in effect to NL's foreign associates. This unrefuted evidence demonstrates conclusively that it was no offhand expression of a unilateral policy that DP made to NL and its foreign associates. Nor should it be overlooked that IG, the powerful chemical trust of Germany,

[25] An important fact is that the letter from National Lead to IG which on its face indicates that du Pont was cooperating with the cartel not only was shown to Rupprecht by National Lead but a copy sent to du Pont. du Pont here argues that since neither Rupprecht nor Beschorman were able to testify, there is no proof that Rupprecht acquiesced in the

had vigorously disapproved the proposed cross-licensing agreement between NL and du Pont, since it departed from the restrictions imposed upon other cartel members. Yet, after the assurances made by du Pont were transmitted to IG, it withdrew its opposition and thereafter both du Pont and IG conducted themselves in accordance with the understanding. (RE. 282–288.)

Although the lower court did not go so far, it is clear that there was abundant and sufficient evidence for a finding that du Pont by agreement, partially written and partially oral, joined the existing conspiracy in 1933 (*Interstate Circuit* v. *United States,* 306 U. S. 208; *American Tobacco Co.* v. *United States,* decided June 10, 1946, Nos. 18–20, last Term), and that du Pont's subsequent conduct resolves any conceivable doubt as to its participation in the cartel. Indeed, it seems clear that the lower court leaned over backwards in resolving any inferences to be drawn from the evidence in favor of defendant du Pont. The fact that du Pont had full knowledge that an illegal conspiracy was in existence, that it was invited

---

letter rather than objecting to it. But clearly du Pont did not object in writing to the letter even after a copy was sent to it, and just justifies an inference that du Pont did not regard the letter as inaccurately stating its true position. That this inference is a proper one is corroborated by the fact that National Lead and IG interpreted the correspondence as indicating that du Pont intended to cooperate, and that in fact du Pont's subsequent conduct was entirely consistent with this interpretation.

to participate in the illegal activities of the cartel, that it entered into a licensing agreement with the cartel (assuming *arguendo* that Exhibit E is legal on its face), knowing that it would further the purposes and objectives of the conspiracy, that du Pont received all the benefits of the conspiracy, would ordinarily be sufficient to justify a finding that du Pont became a member of the conspiracy. *United States* v. *Masonite Corp.*, 316 U. S. 265, 275; *Interstate Circuit* v. *United States*, 306 U. S. 208. This conclusion can be reached quite apart from any consideration of the assurances given by du Pont at the time of the execution of Exhibit E.

The simple answer to du Pont's contention that the "assurances" were made to mislead the cartel members and were never commitments on du Pont's part is found in in the fact that du Pont carried out the assurances and enjoyed the fruits of the conspiracy. Later-day declarations by du Pont to the contrary are sufficiently answered by the fact that they "must be held to have intended the necessary and direct consequences of their acts and cannot be heard to say the contrary." *United States* v. *Patten*, 226 U. S. 525, 543.

Defendant du Pont seizes upon the failure of the lower court to use the word "agreement" in its findings, and argues from this that the use of the word "assurances" is not sufficient to justify a finding of participation by du Pont in the conspiracy. Quite apart from the fact that the evidence demonstrates that du Pont gave its "in-

formed and interested cooperation," *Direct Sales Co.* v. *United States*, 319 U. S. 703, 713, and that by its assurances a meeting of the minds in fact resulted, defendant DuPont errs in its interpretation of conspiracy law. In the *Interstate Circuit* case, *supra*, the late Chief Justice carefully disposed of a similar contention, stating (pp. 226–227):

> While the District Court's finding of an agreement of the distributors among themselves is supported by the evidence, we think that in the circumstances of this case such agreement for the imposition of the restrictions upon subsequent-run exhibitors was *not* a prerequisite to an unlawful conspiracy. * * *
>
> It is elementary that an unlawful conspiracy may be and often is formed without simultaneous action or agreement on the part of the conspirators. [Citing cases.] Acceptance by competitors, without previous agreement, of an invitation to participate in a plan, the necessary consequence of which, if carried out, is restraint of interstate commerce, is sufficient to establish an unlawful conspiracy under the Sherman Act. *Eastern States Lumber Assn.* v. *United States*, 234 U. S. 600; *Lawlor* v. *Loewe*, 235 U. S. 522, 534; *American Column Co.* v. *United States*, 257 U. S. 377; *United States* v. *American Linseed Oil Co.*, 262 U. S. 371. [Italics supplied.]

This language was cited with approval and applied in *United States* v. *Masonite Corp.* 316 U. S. 265, 275.

More recently, in *United States* v. *Bausch & Lomb Co.*, 321 U. S. 707, 723, the Court, holding that there was a conspiracy between Soft-Lite and various optical wholesalers, reaffirmed the principle plainly expressed in the *Interstate Circuit* opinion in saying:

> • • • Whether this conspiracy and combination was achieved by agreement or by acquiescense of the wholesalers coupled with assistance in effectuating its purpose is immaterial.

DP attempts to nullify the effect of the *Interstate Circuit* and *Masonite* decisions by the assertion that in truth the Court merely held in those cases that in the circumstances recited, an agreement could be implied. Not only is this construction contradicted by the express language of the court, but in the *Interstate Circuit* case, the Court indicated that the finding of conspiracy would be justified even if the evidence had not supported the finding of an agreement among the distributors, and in the *Masonite* case, *supra*, the opinion states that there was an illegal price fixing combination.

> • • • though the District Court found that, in negotiating and entering into the first agreements, each appellee, other than Masonite, acted independently of the

> others, negotiated only with Masonite, desired the agreement regardless of the action that might be taken by any of the others, did not require as a condition of its acceptance that Masonite make such an agreement with any of the others, and had no discussions with any of the others * * * [pp. 275].

The lower federal courts have also recognized that the absence of an agreement does not preclude a finding of unlawful conspiracy. *United States* v. *Paramount Pictures,* 66 F. Supp. 323 (S. D. N. Y.). In *William Goldman Theaters* v. *Loew's, Inc.,* 150 F. 2d 738, 745 (C. C. A. 3), the court announced that:

> * * * Uniform participation by competitors in a particular system of doing business where each is aware of the other's activities, the effect of which is restraint of interstate commerce, is sufficient to establish an unlawful conspiracy, under the statutes before us * * *.

In *United States* v. *Tuffanelli,* 131 F. 2d 890, 893 (C. C. A. 7), the court held that a verdict of guilty on a conspiracy charge was justified by the evidence, since it was not

> * * * necessary to establish that the acts of the defendants were pursuant to mutual agreement. It is enough if the proof shows that two or more persons, in voluntary cooperation, have participated in an enterprise which necessarily involves the commission of an indefinite number

of substantive offenses, *United States* v. *Wroblewski*, 7 Cir., 105 F. 2d 444.

It is also a well established principle that one who knowingly aids or cooperates in furthering an unlawful conspiracy, thereby becomes a party to it. *Martin* v. *United States*, 100 F. 2d 490 (C. C. A. 10), certiorari denied, 306 U. S. 649, 651; *Beard* v. *United States*, 82 F. 2d 837 (App. D. C.), certiorari denied, 298 U. S. 655; *Capriola* v. *United States*, 61 F. 2d 5 (C. C. A. 7), certiorari denied, 287 U. S. 671; *Coates* v. *United States*, 59 F. 2d 173 (C. C. A. 9); *Parnell* v. *United States*, 64 F. 2d 324 (C. C. A. 10); *Booth* v. *United States*, 57 F. 2d 192 (C. C. A. 10); *Di Bonaventura* v. *United States*, 15 F. 2d 494 (C. C. A. 4); *Simpson* v. *United States*, 11 F. 2d 591 (C. C. A. 4), certiorari denied, 271 U. S. 674; *Allen* v. *United States*, 4 F. 2d 688 (C. C. A. 7), certiorari denied, 267 U. S. 597, 598; *Rudner* v. *United States*, 281 Fed. 516 (C. C. A. 6), certiorari denied, 260 U. S. 734.

This rule was applied to a Sherman Act conspiracy in *United States* v. *Standard Oil Co.*, 152 Fed. 290 (E. D. Mo.), where the court stated at 294:

> * * * One who learns of a conspiracy after it is formed, and then joins it, or knowingly aids in the execution of its scheme, and shares in its profits, becomes from that time as much a co-conspirator as if he were one of those who originally designed it and put it in operation [cases cited].

Although many conspiracy cases do speak in terms of agreement, express or implied, analysis of these cases shows that what was meant was nothing more than knowing cooperation in the furtherance of the illegal scheme. *Eastern States Retail Lumber Dealers' Assn.* v. *United States*, 234 U. S. 600; *American Column Co.* v. *United States*, 257 U. S. 377; *Direct Sales Co.* v. *United States*, 319 U. S. 703.

These decisions should dispose of du Pont's contention. du Pont accepted an invitation to participate in a plan the necessary consequence of which was restraint of interstate and foreign commerce. du Pont acted in accordance with its assurances and the other conspirators relied upon such assurances and acted in accordance therewith. du Pont received the benefits of the conspiracy. It hardly lies in the mouth of defendant du Pont now to argue that it entered the cartel with its fingers crossed. The Sherman Act is concerned with substance, not with form, *Standard Oil Co.* v. *United States*, 221 U. S. 1; insofar as the Sherman Act is concerned, the result must turn not on the skill with which counsel has manipulated language but on the significance of the business practices in terms of restraint of trade. *United States* v. *Masonite Corp.*, 316 U. S. 265, 280. The context of the lower court's opinion and findings makes clear that the "assurances" were conspiratorial in nature and resulted in concerted action violative

of the Sherman Act. Exercises in semantics must not be allowed to subvert enforcement of the Sherman Act.

13. The trial court was correct in holding Exhibit E to be an unlawful agreement and that Standard Oil Company (Indiana) v. United States, 283 U. S. 163, does not hold to the contrary

du Pont concedes that this agreement was found by the District Court to be unlawful (p. 94). If this finding is correct, du Pont's guilt is conclusively established, quite apart from its participation in the illegal international cartel and du Pont has therefore assumed the burden of overturning this finding as well as the finding of participation in the cartel. Its entire attack on this finding (pp. 85–107) is based upon a discussion of selected innocent circumstances preceding the making of the agreement coupled with the assertion that the court's finding of illegality was based upon the presence of three provisions respectively relating to future patents, technical exchange, and tonnage limitations, which were also present in *Standard Oil Company (Indiana) v. United States*, 283 U. S. 163[*] (the *Cracking* case). The fact that the parties to the agreements in the *Cracking* case were there found not guilty of violating the Sherman Act is then

[*] The Government had not based its claim of Sherman Act violation in the *Cracking* case upon the presence of such provisions.

said to be conclusive upon the liability of du Pont in this case.

du Pont argument ignores the fact that the finding of illegality in this case was necessarily based upon unreasonably restrictive effects flowing from the making of this agreement as revealed by the record made in this proceeding. The provisions referred to in du Pon'ts brief were merely recited in the court's findings. The findings which made this agreement illegal are those relating to the agreement itself (F. 79, R. 291–293), together with the finding (F. 95, R. 303–306) as to the effects of the agreements and understandings between the defendants, which, of course, includes this basic agreement. The later finding which sets forth in detail the effects necessarily flowing from the agreements previously found, including Exhibit E, states that "NL and DP control and dominate the manufacture and sale of titanium pigments and compounds in the United States to the exclusion of all actual or potential competitors" and that they "secured a monopoly of technical information" relating to the titanium business "to the exclusion and detriment of other producers" (R. 304–305). There were, of course, no such findings in the *Cracking* case, since the defendants in that case had not achieved by means of the challenged cross-licensing agreements, or otherwise, a collective position in the gasoline industry remotely

approaching that of either du Pont or national Lead in the industry here involved."

The preceding discussion in this brief of the facts in the record regarding du Pont's participation in the violations charged is sufficient to establish the validity of the findings as to the effects of this agreement. In the *Cracking* case, after pointing out that a pooling of process patents where domination exists (p. 174) or a cross-licensing agreement used to effect a monopoly (p. 175) would violate the Sherman Act, the Court said, "We must, therefore, examine the evidence to ascertain the operation and effect of the challenged contracts" (p. 175). Thus, du Pont's attempt to convert the question of the validity of this agreement into a matter of abstract law by reliance on the *Cracking* case fails at the outset. When the findings in this case as to the effects of the agreement are compared with the Court's conclusions in the *Cracking* case that the evidence there showed "no monopoly, or restriction of competition," in the production (p. 177) or sale (p. 178) of gasoline and that "no monopoly of any kind, or restraint of interstate commerce, has been effected either by means of

[37] As the Supreme Court said in the *Cracking* case (283 U. S., at 176): "The output of cracked gasoline in the years in question was about 26 percent of the total gasoline production. Ordinary or straight run gasoline is indistinguishable from cracked gasoline and the two are either mixed or sold interchangeably."

the contracts or in some other way" (p. 179), the attempted analogy becomes absurd.

It is immaterial for present purposes whether Exhibit E would be illegal in isolation. The setting and effect of the agreement in conjunction with other understandings and the conduct of the parties unquestionably brings the case within the caveats in the *Cracking* case that patent pooling agreements where domination exists (which obviously means domination outside of the agreement) or which effects a monopoly would be unlawful.

Even without consideration of the actual exclusionary and monopolistic effects of this agreement found by the court below, it is apparent that the mere making of such an agreement by two parties who themselves represent the sole domestic possessors of patent rights and technology required to engage in a particular industry could never be justified under the Sherman Act. Obviously, those who dominate an industry are under different Sherman Act disabilities in dealing with each other than those who are merely seeking a competitive foothold. The agreement on its face was one which embraced entire fields of business activity in which there were then no domestic competitors of the parties and was by its express terms an obvious device for preventing the entrance of potential competitors into the fields covered, except on terms fixed by the defendants. The permanent nature of the licenses granted, the

wide scope of the present and future patent coverage, and the complete inclusion of all technical data relating to the field covered, regardless of its application to any particular patent licenses, all show that the parties must have contemplated exactly the result that the evidence showed they achieved. When an agreement of this character, made by such parties, is coupled with a record of performance showing that the contemplated exclusionary effects were actually achieved, there can be no question as to its illegality. The *Cracking* case supports this conclusion rather than the contrary.

II

THE PROVISION OF PARAGRAPH 7 REQUIRING DU PONT AT THE REQUEST OF A LICENSEE UNDER PARAGRAPH 7 TO IMPART IN WRITING THE METHODS AND PROCESSES USED BY IT IN ITS COMMERCIAL PRACTICE UNDER THE LICENSED PATENTS WAS NEITHER BEYOND THE POWER OF THE DISTRICT COURT NOR AN ABUSE OF DISCRETION

Du Pont requests elimination of the requirement that it must, at the request of a licensee under paragraph 7, impart in writing, at a reasonable charge, the method and processes used by DP at the date of the license in its commercial practice under the licensed patents in connection with the production of titanium pigments. The Government in No. 89 has contended that this provision should be amended to provide access to the entire technology of the industry. Brief

pp. 127–131. The argument in support of that contention answers most of the arguments now made by du Pont. We will here consider only arguments not answered in our brief in No. 89. It is important to note that DP agrees that the possession of this technology is a competitive advantage (DP Br. 115–116) and that in an infant industry competition will benefit by access to the technology of competitors (*ibid.* 115–119). Its further statement that this is a mature industry disregards the obvious fact that while it may be mature as to the defendants it is, as a result of the unlawful conspiracy, an infant industry to all others.

While vigorously contending that it would have been impossible for it to have entered the industry in competition with National Lead without access to the technology of National Lead (DP Br. 119), DP asserts that any who now wish to compete with DP and NL can do so effectively without access to the technology which they have accumulated. It implies, without stating, that this technology is now readily available to all (DP Br. 115). There is nothing to support this implication in the record, and it strains credulity to believe that this valuable and closely guarded secret has been revealed. Moreover, it can find no support for its contention in the fact that Zirconium and VC have been able to operate without access to its technology. The District Court specifically found that the defendant's

monopoly of technology was to the exclusion and detriment of the other producers engaged in the titanium pigment business in the United States (R. 305).

That DP did not exchange technology with its co-conspirators after 1940 does not militate against compulsory disclosure. Basically, the relief requested is predicated upon the fact that access to this technology is essential to dissipate the effects of the conspiracy. Its availability does not turn upon a showing that it was acquired as the product of an unlawful agreement. However, it is obvious that a vast amount of DP's current technology was acquired as a result of the unlawful combination and that this information was a prerequisite to any additional technology DP may have acquired since 1940. Moreover, even if there was any basis for treating DP's after-acquired technology on a different basis, the fact remains that it is utterly impossible to segregate the technology acquired as a result of the conspiracy and that technology which is in no way dependent upon that acquired prior to 1940. Since no segregation can be made, under settled principles of law all the technology must be similarly treated. See brief for the United States No. 89, pp. 118–121.

DP argues that a court of equity will not exercise its discretion to prevent irreparable injury when it is impractical to determine if there has been compliance with its order. We do not

find persuasive the notion that DP should not be required to divulge technology acquired, at least in large part, as a result of an unlawful conspiracy when necessary to dissipate the effects of its unlawful conduct, on the ground that a court would find it difficult to determine if du Pont was complying in good faith with the court's order. But, in any event, the suggested practical difficulties do not exist. Much of the technology obviously does not and cannot reside exclusively in the minds of DP's employees; and there would be no problem in determining if this technology were made available. As to that in the minds of defendant's employees, the capacity of the technology divulged to produce that which DP itself produces furnishes an adequate test. Moreover, a mere inspection of the plant and operations of DP by a skilled technician would quickly detect an incomplete or inaccurate disclosure. Finally, we suggest that the problem of enforcement is one which arises only in the course of enforcement proceedings, and, to the extent that enforcement is difficult, the Government rather than DP is hurt.

DP's contention that a court is without power to compel disclosure of technology is based primarily upon the decision of this Court in the *Hartford Empire* case, 323 U. S. 386. The Government's views with respect to this decision and the effect which should be given to it are set forth

in its brief in No. 89, pp. 104–123, 130, and will not be repeated here.

III

THE PROVISIONS OF PARAGRAPHS 5 AND 6 OF THE JUDGMENT DO NOT UNDULY RESTRICT NATIONAL LEAD'S RIGHT TO CONTRACT

Defendant NL contends that paragraphs 5 and 6 of the judgment, quoted below, should be amended by deleting the italicized words and inserting the capitalized word:

> 5. The following agreements are hereby adjudged to be unlawful under Section 1 of the Sherman Act and each of them is hereby cancelled *and the defendants and each of them and all persons acting or claiming to act throu[illegible], for or under them and all successors and subsidiaries of any of the defendants are hereby enjoined and restrained from the further performance of any of the provisions of said agreements and of any agreements amendatory thereof or supplemental thereto:* [followed by a list of the cancelled agreements].
>
> 6. Each of the defendants and each of their directors, officers, agents, employees, successors and subsidiaries and all persons acting, or claiming to act under, through or for them or any of them are hereby enjoined and restrained (a) *from entering into, adhering to, maintaining or furthering, directly or indirectly, or claiming any rights under any contract, agreement, understanding, plan or program among them-*

selves, the co-conspirators, or with any other person, partnership or corporation, which has as its purpose or effect the continuing or renewing of any of the agreements listed in paragraph 5 hereof; (b) from entering into, adhering to, maintaining or furthering, directly or indirectly, any contract, agreement, undertaking, plan or program with any other producer or dealer relating to titanium pigments which has as its purpose or effect (1) to divide sales or manufacturing territories, (2) to allocate markets, (3) to limit or prevent United States imports or exports, (4) to grant to any third party any market as its exclusive territory, (5) to keep any third party out of any market; provided, however, that nothing contained in this subdivision (b) of this paragraph 6 shall prohibit any normal and usual arrangements between any defendant and its directors, officers, employees, agents, subsidiaries, or any PRODUCER, dealer, or distributor, whether or not a co-conspirator; (c) from restricting any purchaser of titanium pigments in the use thereof.

These paragraphs go no further than is reasonably necessary to grant effective relief. The contracts enumerated in paragraph 5 were some of the instrumentalities through which the international cartel was created and the defendants' power to dominate and control the interstate and foreign commerce of the United States in titanium pigments was acquired. That these contracts,

specifically found to violate the Act (R. 310–311), a finding not challenged in this Court, should be cancelled is conceded by NL and beyond dispute. To implement that cancellation, the judgment enjoins the further performance of any of the provisions of the cancelled contracts. It also enjoins the further performance of any existing agreement amendatory of or supplemental to any of the cancelled agreements. This implementation was necessary to insure that all existing agreements should henceforth be unenforceable and also to create a sanction against disregard of the order of cancellation. Since this paragraph deals solely with the future enforceability of existing contracts, NL's contention that the deletion of the italicized portion is necessary in order to remove barriers to future contracts is incorrect.

Paragraph 6 deals with future contracts. Clause (a) enjoins the defendants from entering into or adhering to any agreement, plan or program "which has as its purpose or effect the continuing or renewing of any of the agreements" enumerated in paragraph 5. Since the enumerated agreements were found to violate the Act, this provision can impose no unjustified restriction on NL's power to contract.

NL's contention that the proviso in clause (b) of paragraph 6 should be amended to include producers, is based upon vague unsupported allegations of hardship. Such allegations furnish no basis for a conclusion that that district court abused

its discretion. If, at some future time, National Lead can demonstrate that its right of contract has been unduly restricted, it may apply to the district court for a modification of the judgment.

IV

THE TRIAL COURT DID NOT ABUSE ITS DISCRETION IN REFUSING TO PERMIT NL AND ITS FOREIGN CO-CONSPIRATORS JOINTLY TO OWN FOREIGN PRODUCERS OF TITANIUM PIGMENTS

Defendant NL contends that the provisions of paragraph 8 of the judgment are an abuse of the trial court's discretion and should be eliminated (NL Br. 64, 99). This paragraph requires NL and Tinc, within one year from the date of the judgment, to present to the Court a plan for divesting themselves, within two years, of all their stockholdings and other financial interests in the British, Canadian, German, and Japanese companies, or for the purchase of the entire holdings and other financial interests of the foreign co-conspirators in these companies (R. 314).[38]

The circumstances under which the stock and other financial holdings in these companies were acquired are set forth in detail in the Statement in the brief for the United States in case No. 89, this Term, pp. 16–22. Briefly stated, these holdings were acquired in consummating a plan to

[38] NL states that it has entered into an agreement to purchase all of the stock of CTP and, therefore, consideration of the relationship between NL and CTP has been taken out of this case (NL Br. 66).

utilize TAS (the predecessor of Tinc) and its rights under the 1920 contract further to control competition in all markets of the world, including competition in the interstate and foreign commerce of the United States. The plan was as follows: TAS was to form in each of the important industrial countries, in association with a local company which contemplated the manufacture or sale of titanium pigments or which could contribute to the commercial or technical development or which threatened to be a serious competitor of NL or TAS, a new company in which NL or TAS was to have a part interest. Each company so formed was to be given as its exclusive territory a portion of the territory assigned to TAS by the 1920 agreement and was to refrain from competing with NL in its exclusive territory or in the exclusive territory of any other company associated with NL. All of the present and future patents of NL or TAS or of any of the companies associated with either in the formation of such new companies, as well as those of the new companies to be organized, were to be licensed exclusively to NL for North America and to the new companies to be organized for their respective territories and to TAS for the rest of the world. Pursuant to this plan, TAS entered into agreements with the most important potential competitors in Germany, England, Canada, and Japan, which resulted in

the formation and joint ownership of TG, BTP, CTP, and TK.

The trial court found that these agreements were in violation of the Act and ordered them canceled (R. 310–311). However, the consummation of the plan with the resulting joint ownership of the foreign producers created a condition inherently destructive of competition. The foreign co-owners will not otherwise enter into the business so long as they are substantial owners in a company engaged in the titanium pigment business; a jointly owned company is not likely to export to the United States to compete with NL, the owner of a substantial block of its shares, and NL will not export to markets now served by its affiliated jointly owned companies. Indeed, it is difficult to believe that NL would be so intent upon remaining a co-owner of these companies if it expected serious competition to arise between it and them or between them.

The Government contended below that these jointly owned foreign competitors, having been formed for the purpose and having the necessary effect of suppressing competition with the defendants in the interstate and foreign commerce of the United States, should be freed from the influence of National Lead. It therefore requested divestiture by National Lead of its stock interest in these jointly owned companies. The trial court granted this request but permitted NL, as an alternative to divestiture, to

purchase the entire remaining financial interests of its co-conspirators in the jointly owned companies. This alternative was apparently permitted upon the theory that adequate relief would be afforded if the association or community of interest between NL and its co-conspirators was terminated. The effect of this was to permit National Lead to continue to control the major foreign producers of titanium pigments and to exclude competition from foreign producers unless and until National Lead's foreign partners should organize new companies to engage in the titanium pigment business.[*]

Defendant NL now contends that it was an abuse of discretion to prohibit continued joint ownership of the foreign producers. It argues that nobody can assert with assurance that the prohibition will, in fact, stimulate foreign trade (NL Br. 51). But it would not be material if foreign competition could not be assured. There are few cases in which a court can compel or assure competition, especially when the potential competitor is located in a foreign country. Yet this does not relieve the court from the duty to remove unlawfully created obstacles to the rise of competition or terminate an unlawful association of competitors. The very theory of the Act is that in the absence of unlawful restric-

[*] Although not persuaded that this is a proper provision, the Government has not assigned it as error and will not attack it in this case.

tions the profit motive will develop competition. In this connection it is material that continued joint ownership will, as we have shown, substantially prevent the development of future competition from the foreign producers. Certainly a court does not abuse its discretion when it refuses to foreclose the competition the Act was designed to promote.

As a supplemental argument National Lead contends that the injunctive relief granted by the judgment would eliminate the evil of joint ownership. This contention disregards the obvious fact that restraint is inherent in the arrangement, and that agreements such as those proscribed by the judgment are unnecessary. But apart from this consideration, entering into such agreements would be facilitated and their detection rendered virtually impossible by continued joint ownership, since the books, records of shipments, and other relevant data would be located in a foreign country beyond the jurisdiction of the court. Under these circumstances it is not an abuse of discretion to prohibit joint ownership. As this Court said of an analogous situation in *United States* v. *Crescent Amusement Co.*, 323 U. S. 173, 189–190:

> The fact that the companies were affiliated induced joint action and agreement. Common control was one of the instruments in bringing about unity of purpose and unity of action and in making the con-

> spiracy effective. If that affiliation continues, there will be tempting opportunity for these exhibitors to continue to act in combination against the independents. The proclivity in the past to use that affiliation for an unlawful end warrants effective assurance that no such opportunity will be available in the future.

National Lead suggests that an American concern can most satisfactorily engage in business in foreign countries by combining with foreign concerns to create a joint enterprise. From this it argues that such arrangement should be regarded as one of the "normal and usual" commercial arrangements for expanding trade which this Court said were exempted from the Act by the so-called "rule of reason." We do not agree that the "rule of reason" can be invoked to legitimatize arrangements so contrary to the basic policy of the Act. However, it is not necessary to determine this question. The issue here is the quantum of relief the trial court was justified in granting to dissolve and to dissipate the effects of an unlawful combination and not whether the series of partnership arrangements standing alone would be unlawful. As Mr. Justice Douglas stated in his concurring opinion in *Associated Press* v. *United States*, 326 U. S. 1, 24:

> * * * it is well settled that a feature of an illegal restraint of trade, which is innocent by itself and which may be lawfully used if independently established, may be

> uprooted along with the other parts of an illegal arrangement. *Ethyl Gasoline Corp.* v. *United States*, 309 U. S. 436, 461; *United States* v. *Univis Lens Co.*, 316 U. S. 241, 254.

United States v. *Bausch & Lomb Co.*, 321 U. S. 707, 724, is to the same effect. In this connection it is apparent that the joint ownership of these companies was promoted for an illegal purpose, was an integral part of the unlawful combination, and, if permitted to continue, will perpetuate some of its unlawful effects.

NL's contention that the prohibition against joint ownership will cause it a pecuniary loss rests upon the bare unsupported assertion that NL will not receive the full value of its shares in BTP. Moreover, if this were true, there is no way of accurately measuring the loss of NL since it cannot be shown how much of the present value of the shares is the product of the illegal combination. But even if NL will suffer a loss, this is no reason for voiding the order of the trial court. In *United States* v. *Crescent Amusement Co.*, 323 U. S. 173, 189, this Court said, in overruling a contention that divestiture should not be granted:

> Those who violate the Act may not reap the benefits of their violations and avoid an undoing of their unlawful project on the plea of hardship or inconvenience.

See also Brief for the United States in No. 89, this Term, pp. 114–117.

CONCLUSION

For the above reasons it is respectfully submitted that the exceptions raised by the defendants to the judgment below are without merit.

Respectfully submitted.

U. S. GOVERNMENT PRINTING OFFICE: 1947

SUPREME COURT OF THE UNITED STATES

Nos. 89, 90, 91.—October Term, 1946.

The United States of America, Appellant, 89 v. National Lead Company, Titan Company, Inc., and E. I. du Pont de Nemours and Company.	On Appeals from the District Court of the United States for the Southern District of New York.
National Lead Company, and Titan Company, Inc., Appellants, 90 v. The United States of America.	
E. I. du Pont de Nemours and Company, Appellant, 91 v. The United States of America.	

[June 23, 1947.]

Mr. Justice Burton delivered the opinion of the Court.

This action was brought by The United States of America, June 24, 1944, in the District Court of the United States for the Southern District of New York, against National Lead Company (a New Jersey corporation, here called National Lead or NL), its wholly owned subsidiary, Titan Company, Inc. (a Delaware corporation, here called Titan Inc. or Tinc) and E. I. du Pont de Nemours and Company (a Delaware corporation, here called du Pont or DP). It is a proceeding in equity instituted under § 4 of the Sherman Antitrust Act, 26 Stat. 209, 36 Stat. 1167, 15 U. S. C. § 4, to prevent and restrain alleged violations of §§ 1 and 2 of that Act, 26 Stat. 209, 50 Stat. 693, 15 U. S. C. §§ 1 and 2. The trial was conducted by Judge Simon H. Rifkind of that court. It began December 4, 1944, and ended March 14, 1945. His opinion was filed July 5, 1945. His 96 findings of fact and two conclusions

of law were entered October 2, 1945. After extended consideration of its terms, by the court and by counsel for all parties, the decree was entered October 11, 1945. The opinion and decree are reported in 63 F. Supp. 513–535. The findings of fact, conclusions of law and much of the detailed discussion of the decree are in the record. Separate appeals were filed in this Court, in case No. 89 by the United States, in case No. 90 by National Lead and Titan Inc. and in case No. 91 by du Pont. The three companies are sometimes referred to as "the appellant companies." We noted probable jurisdiction in each appeal, May 20, 1946, and the three appeals were argued together February 3–5, 1947. A partial stay of the decree had been granted by MR. JUSTICE REED, on January 2, 1946, pending determination of the appeals. Reference is made to the opinion of the District Court for a recital of the complex facts which it had to consider in order to reach its conclusion that National Lead, Titan Inc. and du Pont each violated § 1 of the Sherman Act,[1] although it found a marked difference between the conduct of National Lead and of its subsidiary, Titan Inc., on the one hand, and that of du Pont on the other. This Court affirms the judgment of the District Court, except as to the original effective dates of certain of its provisions, and our discussion will relate largely to the assignments of error as to the terms of the decree.

I. The first issue presented to the District Court was that of the participation of National Lead and Titan Inc.

[1] "SECTION 1. Every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations, is hereby declared to be illegal: . . . . Every person who shall make any contract or engage in any combination or conspiracy hereby declared to be illegal shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding $5,000, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court. 50 Stat. 693–694, 15 U. S. C. § 1.

in a so-called "international cartel" dating back to 1920, and constituting a combination or conspiracy in restraint of trade and commerce in titanium pigments and compounds, among the several states of the United States and with foreign nations, which combination, after 1933, was alleged to include du Pont. The District Court found such participation.[2] In their brief on appeal in No. 90, National Lead and Titan Inc. said:

> "The Government's case was based on a series of closely related agreements made between 1920 and 1944. The agreements have been cancelled and continuation or renewal has been enjoined. The appeals are greatly simplified by the fact that we accept the cancellation and the injunction against continuation or renewal. We submit, however, that the court went too far in forbidding normal and usual contractual arrangements."

Accordingly, the finding of the District Court, as to the participation of National Lead and Titan Inc. in the violation of § 1 of the Sherman Act, is accepted here without further discussion.

II. The second issue was that of the participation of du Pont in such combination after 1933. The District

---

[2] The conclusions of law of the District Court were as follows:

"1. Beginning on or about July 30, 1920, NL and co-conspirator TAS [Titan Co. A/S to which Titan Inc. became a successor in interest] and on various dates thereafter Tinc, DP and the others found herein to be co-conspirators continuing at all times thereafter to the date of these findings have been continuously engaged in a combination and conspiracy in restraint of trade and commerce in titanium pigments and compounds among the several states of the United States and with foreign nations and have been and are now parties to contracts, agreements and understandings in restraint of such trade and commerce.

"2. Plaintiff is entitled to a decree." See also, *United States* v. *National Lead Co.*, 63 F. Supp. 513, 527, 531, 532.

Court found that du Pont "joined the conspiracy found herein to exist between, NL and its foreign associates. DP's status rights and obligations were different from those of the other members of the combination. DP did not thereafter withdraw." Finding of Fact 73. The District Court, in its opinion, also stated that—

> "At least then as to territorial delimitations of the titanium pigment business, DP joined the combination. . . .
>
> . . . . . .
>
> "My general summary of the evidence on this issue is that DP was a member of the combination—true, a special member, with a status, rights and obligations, different from that of the other members, but a member nonetheless." 63 F. Supp. at 530, 531, and see the preamble to the decree at 532.[3]

This finding is contested vigorously by du Pont and is the principal subject matter of its appeal in No. 91. After careful consideration, we agree with the following conclusion of the District Court:

> "In sharp contrast with NL, DP exhibited, from the very beginning of its interest in titanium, an alert consciousness of the anti-trust laws and moved cautiously and under the guidance of trained anti-trust lawyers. The question is whether it succeeded in avoiding not only the form but also the substance of transgression. I have concluded that it has not; . . . ." *Id.* at 527.

It would serve no beneficial purpose to review here the evidence upon which that court based its conclusion. Its opinion analyzes the facts (*Id.* at 527–531) and, in the light of the record as a whole, we find in those facts the support necessary for the conclusion reached.

[3] See note 4, *infra*.

III. Related to these issues was a third. This was whether the contract between National Lead and du Pont was offensive to the antitrust laws apart from the relation of that contract, and of the parties thereto, to the foreign producers. The District Court found that it was and also related it to the international situation. It found that—

> "The defendants NL, DP and Tinc have utilized their patents which relate to the manufacture and use of titanium pigments to control and regulate the manufacture and sale of titanium pigments and compounds in the United States; and NL and Tinc with the co-operation of DP have done so throughout the rest of the world." Finding of Fact 95, subparagraph 9.

In its opinion the District Court emphasized also "the great power they acquired" (*Id.* at 531) and indicated criticism of limitations originally inserted in certain important licenses, although later removed from them. *Id.* at 532. Added together, the control of the patents covered by this agreement gave to National Lead and du Pont "domination and control over the titanium pigment business in the U. S." Finding of Fact 79. The District Court referred to the "proliferation of patents" as another "inevitable consequence" of the agreement. *Id.* at 532. This was explained to mean the great multiplication of related patents, resulting in increasing the difficulty of an attack upon them. The validity of none of the hundreds of patents involved has been litigated.

> "These patents, through the agreements in which they are enmeshed and the manner in which they have been used, have, in fact, been forged into instruments of domination of an entire industry. The net effect is that a business, originally founded upon

> patents which have long since expired, is today less accessible to free enterprise than when it was first launched." *Id.* at 532.

Referring to the exchange of patents between National Lead and du Pont, the District Court added:

> ". . . in the context of the present case, . . . this exchange between two corporations, who between them controlled the entire market, becomes an instrument of restraint, available for use and used, to continue the mastery of the market which NL and DP achieved by means of the illegal international agreements." *Id.* at 532.

These facts are important not only in affirming, as we do, the finding that National Lead, Titan Inc. and du Pont each has violated § 1 of the Sherman Antitrust Act, but also in passing upon the terms of the decree entered in order to prevent future violations of that Act by them.

IV. The remaining issues relate to the terms of the decree. The entire decree, exclusive of its Appendix, is reported at 63 F. Supp. 532–535, and, for reference purposes, is here reprinted in the margin, as there reported.[4]

---

[4] "This cause came on to be heard upon the complaint and the answers thereto upon the evidence and upon argument of counsel. The Court having thereafter rendered and filed its opinion and having made and entered findings of fact and conclusions of law wherein the defendants have been found to have been engaged in a combination in restraint of trade and commerce in titanium pigments among the several states of the United States and of foreign nations, and that the defendants have been and now are parties to contracts, agreements, and understandings in restraint of such trade and commerce in violation of Section 1 of the Sherman Act, 26 Stat. 209, 15 U. S. C. A. § 1;

"Now, therefore, upon motion of plaintiff by Wendell Berge, Assistant Attorney General, Herbert Berman and William C. Dixon, Special Assistants to the Attorney General, Julian Caplan and Ephraim Jacobs, Special Attorneys, and John F. X. McGohey, United States Attorney, for relief in accordance with the prayer of the

This decree represents a careful attempt to fit the remedy to the needs of this case. The record upon which

"4. The term 'patents as herein defined' shall mean United States letters patent and applications as follows: (a) the letters patent and patent applications listed in Appendix A hereof; (b) all divisions, continuations or reissues of any of the foregoing patents and applications; (c) all patents issued upon such applications; (d) all patents which cover any titanium pigments or any process for the manufacture of titanium pigments issued to any of the defendants within five years from the date of this decree; and all such patents which any of the defendants acquires within such five years; and all such patents of which any of the defendants becomes the exclusive licensee within such five years with power to sublicense.

"5. The following agreements are hereby adjudged to be unlawful under Section 1 of the Sherman Act and each of them is hereby cancelled and the defendants and each of them and all persons acting or claiming to act through, for or under them and all successors and subsidiaries of any of the defendants are hereby enjoined and restrained from the further performance of any of the provisions of said agreements and of any agreements amendatory thereof or supplemental thereto:

Agreement dated July 30, 1920, between TP and TAS (Exhibit A);

Agreement between TP and Krebs dated January 1, 1933, as amended January 1, 1941 (Exhibits E and E–3);

Agreements dated July 30, 1920, between NL, TP, The Titanium Alloy Manufacturing Company and TAS (Exhibits A–1 and A–2);

Agreement between TAS and SIT dated March 3, 1927 (Exhibit B);

Agreement between TAS and IG dated Ocotber 3 and 20, 1927 (Exhibit C);

Agreement between TAS and IG signed June 24 and October 20, 1927 (Exhibit C–1);

Agreement between TAS and TG signed October 3 and 20, 1927 (Exhibit C–3);

Agreement between TG and TAS dated October 3 and 20, 1927 (Exhibit C–7);

Agreement between TG and TAS dated October 3 and 20, 1927 (Exhibit C–8);

Agreement dated February 16, 1933 between ICI, ISC, GW and TINC (Exhibit F);

Agreements between TINC, SIT, TERRES RARES, and Thann

over 5,500 pages, reflecting more than three months of trial. It demonstrates a commendable procedure. Pro-

---

dated June 5 and 17, 1935 (Exhibits G–1 and G–2);

Agreements between TINC, TERRES RARES, and IG, and between TINC, Terres Rares, IG, TG, Tharn, and Doitsu [Doitsu Senryo Gomei Kaisha, Kobe/Japan] both dated January 18, 1936 (Exhibits J and J–2);

Agreement between NL and CIL dated January 1, 1937 (Exhibit K);

Agreement between NL and CTP dated January 1, 1937, as amended February 27, 1939 (Exhibits K–1 and K–5);

Agreements between DP and TINC dated July 27, 1937, June 20, 1938, April 21, 1939, May 10, 1940, and June 23, 1941 (Exhibits M, N, Q, R and S), and the

'License Field Extender' agreements to which NL or TINC were parties, including the agreement between NL and TINC dated March 28, 1939 (Exhibit O);

provided, however, that the provisions of this paragraph with respect to the agreements between TP and Krebs dated January 1, 1933, as amended January 1, 1941 (Exhibits E and E–3) shall not go into effect until the expiration of [illegible] months from the date of this decree.

"6. Each of the defendants and each of their directors, officers, agents, employees, successors and subsidiaries and all persons acting, or claiming to act under, through or for them or any of them are hereby enjoined and restrained (a) from entering into, adhering to, maintaining or furthering, directly or indirectly, or claiming any rights under any contract, agreement, understanding, plan or program among themselves, the co-conspirators, or with any other person, partnership or corporation, which has as its purpose or effect the continuing or renewing of any of the agreements listed in paragraph 5 hereof; (b) from entering into, adhering to, maintaining or furthering, directly or indirectly, any contract, agreement, undertaking, plan or program with any other producer or dealer relating to titanium pigments which has as its purpose or effect (1) to divide sales or manufacturing territories, (2) to allocate markets, (3) to limit or prevent United States imports or exports, (4) to grant to any third party any market as its exclusive territory, (5) to keep any third party out of any market; provided, however, that nothing contained in this subdivision (b) of this paragraph 6 shall prohibit any normal and usual arrangements between any defendant and its directors,

posed findings of fact and conclusions of law were submitted on behalf of the respective parties and a form of

---

officers, employees, agents, subsidiaries, or any dealer or distributor, whether or not a co-conspirator; (c) from restricting any purchaser of titanium pigments in the use thereof.

"7. Each of the defendants is ordered to grant to any applicant therefor, including any defendant or co-conspirator, a non-exclusive license under any or all of the patents as herein defined at a uniform, reasonable royalty. Such grant may, at the option of the licensor, be conditioned upon the reciprocal grant of a license by the applicant, at a reasonable royalty, under any and all patents covering titanium pigments or their manufacture, now issued or pending, or issued within five years from the date of this decree, if any, owned or controlled by such applicant. Such license or reciprocal license may, at the option of either party, contain a provision for the inspection of the books and records of the licensee by an independent auditor who shall report to the licensor only the amount of royalty due and payable and no other information. During a period of three years from the date of this decree such license or reciprocal license may at the option of either party contain a provision for the imparting in writing, at a reasonable charge, by the licensor to the licensee, of the methods and processes used by the former at the date of the license in its commercial practice under the licensed patents in connection with the production of titanium pigments. The Court reserves jurisdiction to pass upon the reasonableness of any royalty or charge herein directed to be reasonable. Defendants are restrained from attempting to enforce any rights under any foreign patents owned by them or under which they are the exclusive licensees to prevent the exportation of titanium pigments from the United States to any foreign country.

"8. Within one year from the date of this decree, defendants NL and Tinc shall present to the Court for its approval a plan for divesting themselves of their stock holdings and other financial interest, direct and indirect, in BTP, CTP, TG and TK, or for the purchase of the entire stock holdings and other financial interests, direct and indirect, in said companies or any of them. Such plan of sale shall not provide for the transfer of such stock or interest to any other defendant or to any corporation in which any defendant will, upon consummation of the plan, have any interest, provided that this provision shall not preclude transfer of said defendants' stock holdings in BTP to ISC, GW, and ICI, or any of them, or preclude transfer of said defendants' stock holdings in CTP to CIL. The

decree was submitted on behalf of the Government to the District Court immediately following the trial. The

---

plan shall provide for its completion within two years from the date of this decree.

"9. Either American Zirconium Corporation or Virginia Chemical Corporation, their successors or assigns, may at their option, if exercised within six months from the date of this decree, apply for licenses from DP under the provisions of paragraph 7. In the event American Zirconium Corporation, Virginia Chemical Corporation or their respective successors or assigns exercise the foregoing option, DP is enjoined from collecting royalties under any existing license agreement relating to titanium pigments between it and the person exercising the option in respect of any period subsequent to such exercise. Defendants NL, Tinc and DP are hereby enjoined from bringing, or threatening to bring, any action against any person or corporation for the alleged infringement prior to the date of this decree of any patent as herein defined.

"10. The Attorney General of the United States or his proper representative shall, for the purpose of securing compliance with this decree, be permitted (1) access, during the office hours of the defendants, to all books, ledgers, accounts, correspondence, memoranda, and other records and documents in the possession or under the control of the defendants, relating to any matters contained in this decree, (2) subject to any legally recognized privilege, without restraint or interference from the defendants, to interview officers or employees of the defendants, who may have counsel present, regarding any such matters; provided, however, that information obtained by the means permitted in this paragraph shall not be divulged by any representative of the Department of Justice to any person other than a duly authorized representative of the Department of Justice except in the course of legal proceedings for the purpose of securing compliance with this decree in which the United States is a party or as otherwise required by law.

"11. Judgment is entered against the defendants for all costs to be taxed in this proceeding.

"12. The cancellation, injunctions and all executory action provided for under this decree shall not become effective or operative until ninety days from the date of this decree.

"13. Jurisdiction of this cause, and of the parties hereto, is retained by the Court for the purpose of enabling any of the parties to this decree, or any other person or corporation that may hereafter become bound, in whole or in part, thereby to apply to the Court at any

opinion of the District Court, when filed, formed the basis of further consultation and argument. After the District Court's findings of fact and conclusions of law were entered, further conferences were held with counsel and full opportunity was given to them to propose changes in the findings of fact and the decree. Much of this discussion was reported in the record and has been of benefit to this Court in reviewing the decree.

In our opinion, the provisions of this decree, to a large extent, are matters lying within the discretion of the District Court as a court of equity whose duty it was to make the remedy as effective as possible. The District Court was confronted with an obligation to give effect to the provisions, on the one hand, of the patent laws granting certain valuable rights in the nature of monopolies to the patentees and their licensees, and also to give effect, on the other hand, to the provisions of the Sherman Antitrust Act prohibiting any combination or conspiracy in restraint of trade among the several states or with foreign nations. We believe that the District Court has not exceeded its discretion in the provisions of this decree but has employed its discretion with commendable fairness having especial regard to the needs of this case. It has succeeded in keeping within the lines of precedent thus far established, although, in this field, such lines cannot be much

---

time for such further orders, modifications, vacations or directions as may be necessary or appropriate.

(1) for the construction or carrying out of this decree, and

(2) for the enforcement of compliance therewith and the punishment of violations thereof."

"Appendix A" consists only of the identification of National Lead's 82 patents and 20 applications for patents; Titan Inc.'s 19 patents and 1 application; Titan Co. A/S's 2 patents; I. G. Farbenindustrie's 22 patents; Titangesellschaft's 2 patents; and du Pont's 175 patents and 30 applications. The references in the decree to Exhibits refer to such exhibits as they are identified in the record of this case in the District Court.

more than guides. The essential consideration is that the remedy shall be as effective and fair as possible in preventing continued or future violations of the Antitrust Act in the light of the facts of the particular case.

The issues are presented by the assignments of error in the three appeals. They will be considered separately in conjunction with their supporting arguments. In each instance we sustain the present decree.

A. Request to omit the requirement of the granting of compulsory, nonexclusive licenses at uniform, reasonable royalties and to substitute for that requirement, either a perpetual injunction against the enforcement of the titanium patents presently owned or controlled by the respective appellant companies, or a provision for compulsory licenses to be issued under those patents, free of royalties.

This is the major legal issue in this case.

The material provisions in the present decree are as follows:

> "4. The term 'patents as herein defined' shall mean United States letters patent and applications as follows: (a) the letters patent and patent applications listed in Appendix A hereof; (b) all divisions, continuations or reissues of any of the foregoing patents and applications; (c) all patents issued upon such applications; (d) all patents which cover any titanium pigments or any process for the manufacture of titanium pigments issued to any of the defendants within five years from the date of this decree; and all such patents which any of the defendants acquires within such five years; and all such patents of which any of the defendants becomes the exclusive licensee within such five years with power to sublicense.
>
> . . . . . .
>
> "7. Each of the defendants is ordered to grant to any applicant therefor, including any defendant or

co-conspirator, a non-exclusive license under any or all of the patents as herein defined at a uniform, reasonable royalty. Such grant may, at the option of the licensor, be conditioned upon the reciprocal grant of a license by the applicant, at a reasonable royalty, under any and all patents covering titanium pigments or their manufacture, now issued or pending, or issued within five years from the date of this decree, if any, owned or controlled by such applicant. Such license or reciprocal license may, at the option of either party, contain a provision for the inspection of the books and records of the licensee by an independent auditor who shall report to the licensor only the amount of royalty due and payable and no other information. During a period of three years from the date of this decree such license or reciprocal license may at the option of either party contain a provision for the imparting in writing, at a reasonable charge, by the licensor to the licensee, of the methods and processes used by the former at the date of the license in its commercial practice under the licensed patents in connection with the production of titanium pigments. The Court reserves jurisdiction to pass upon the reasonableness of any royalty or charge herein directed to be reasonable. Defendants are restrained from attempting to enforce any rights under any foreign patents owned by them or under which they are the exclusive licensees to prevent the exportation of titanium pigments from the United States to any foreign country."

The assignment of error originally made by the Government, in No. 89, as to this point was as follows:

"1. The court erred in failing to require each defendant to license its existing titanium pigment patents free of royalty until the court shall have determined, on application by any defendant, that the

effects of the defendants' illegal combination, as set forth in the court's findings of fact and conclusions of law, have been fully dissipated."

Later the Government moved to amend this assignment of error so that it would read as follows:

"The court erred in failing to enter an injunction perpetually enjoining the defendants from enforcing the titanium patents presently owned or controlled by them."

This Court postponed consideration of the above motion to the hearing of the case on its merits. On oral argument, the Government supported its second proposal but indicated that, if that proposal were not satisfactory, it would prefer its original request to the provision for uniform, reasonable royalties now in the decree. The Government's motion to amend its assignment of errors accordingly is granted. National Lead, in its assignments of error in No. 90, however, assigns the orders contained in paragraph 7 of the decree on this subject as error and, in its briefs, argues that "The court erred in refusing to order royalty-free licensing of all patents as defined in the judgment." Accordingly, both proposals have been considered.

While it has been contended that, because of the decision of this Court in *Hartford-Empire Co.* v. *United States*, 323 U. S. 386, the District Court was not free in the present case to require the issuance of royalty-free licenses, we feel that, without reaching the question whether royalty-free licensing or a perpetual injunction against the enforcement of a patent is permissible as a matter of law in any case, the present decree represents an exercise of sound judicial discretion.

This is a civil, not a criminal, proceeding. The purpose of the decree, therefore, is effective and fair enforcement, not punishment. An understanding of the findings of

fact is essential to an appreciation of the reasons for the decree.

Pure titanium pigment and its compounds represent a product of comparatively recent development but of major commercial value. The District Court found that—

> "Titanium pigments are possessed of great opacity, hiding power and chemical inertness, and are largely displacing other pigments such as lithopone and white lead. Titanium pigments are used in the manufacture of paints and are also used in the manufacture of rubber, glass, paper, vitreous enamels, and many other products. . . .
>
> "In and before 1920 there was no substantial trade or commerce in, and no commercial manufacture of, titanium pigments for use in paint, paper, rubber, or other products; . . . ." Finding of Fact 33.
>
> "The production of titanium pigments in the United States has risen from 100 tons (on the basis of pure TiO_2 content) in 1920 to approximately 110,000 tons in 1943 with a peak production of approximately 128,000 tons in the United States in 1941. The total production of titanium pigments and compounds outside of the United States has shown less growth, the estimated foreign production of titanium pigments and compounds being approximately 1,000 tons in 1920 and approximately 23,000 tons in 1938." Finding of Fact 35.

There are four producers of titanium products in the United States—National Lead, du Pont, American Zirconium (here called Zirconium), which is a subsidiary of Glidden Company, and Virginia Chemical Company (here called Virginia Chemical), which is a subsidiary of American Cyanamid Company. National Lead and du Pont have cross-licensed each other under their respective patents. Zirconium entered the field in 1935 with licenses

from National Lead and du Pont, but the National Lead license has been canceled. Virginia Chemical entered the field in 1937 with a license from du Pont. Finding of Fact 42.

National Lead has assets of over $100,000,000 and is the largest manufacturer of titanium pigments and compounds not only in the United States but in the world. In 1943 it manufactured and sold 76.5% of composite pigments and 46.4% of pure TiO_2 made in the United States. Finding of Fact 3. Du Pont is one of the largest chemical companies in the United States with assets of over $1,000,000,000. It is one of the largest manufacturers of titanium pigments in the United States. In 1943 it manufactured and sold approximately 23.5% of the composite pigments and 45.1% of pure TiO_2 made in the United States. Finding of Fact 9.

National Lead took an early lead in promoting the commercial manufacture and use of titanium pigments. In 1920 it acquired an interest in The Titanium Pigment Company, Inc., which had been organized by the Titanium Alloy Manufacturing Company at Niagara Falls, New York. It made use of a patented process developed by Barton and Rossi. At about that time, a Norwegian chemist, Gustav Jebsen, made similar investigations but along different lines in Norway. He and his associates perfected a patented means for producing relatively pure titanium dioxide by a process much less costly than that in use at Niagara Falls. These associates had not, however, perfected processes for the manufacture of composite pigments. Finding of Fact 33. In about 1922, Joseph Blumenfeld, a chemist and managing director of a French company, obtained patents relating to the manufacture of titanium compounds. Finding of Fact 34.

On July 30, 1920, The Titanium Pigment Company, Inc., (affiliated with National Lead) and Titan Co. A/S

(representing the Jebsen interests) entered into an agreement which is still uncanceled. Its principles became the basis for more than 60 subsequent agreements and for an international cartel [5] in titanium pigments. The essential features of this agreement are stated in Finding of Fact 44 and in the opinion of the District Court, 63 F. Supp. at 517–518.

Briefly stated, it applied to a licensed field, defined as including all substances containing above 2% of titanium unless containing by weight more than 5% of a metal other than titanium in its purely metallic form. It applied to all apparatus, methods and processes useful in obtaining or manufacturing such substances both in the titanium and in the titanium compound field.

Both parties agreed to grant and accept a license, exclusive of all others including the licensor, under all "existing or future" patents of the licensing party. They

---

[5] "Cartels have been defined by two of the foremost members and advocates of such bodies. In the words of Sir Alfred Mond, organizer of Imperial Chemical Industries:

"'I use the word cartel to include fusion, pooling arrangement, quota arrangement and price convention, because a cartel is protean in its form. . . . In an ultratechnical way, a cartel might be defined as a combination of producers for the purpose of regulating, as a rule, production, and, frequently, prices. . . .'

"In the words of Sir Felix J. C. Pole, chairman of Associated Electrical Industries, Ltd.:

"'A cartel or association usually means an association by agreement of companies or sections of companies having common interests. It is designed to prevent extreme or unfair competition and allocate markets, and it may also extend to interchange of knowledge resulting from scientific and technical research, exchange of patent rights, standardization of products, etc. Competition is not eliminated, but it is regulated. Competition in quality, efficiency, and service takes the place of the crude method of price cutting.'" Monograph No. 1, Subcommittee on War Mobilization of the Committee on Military Affairs, U. S. Senate, 78th Cong., 2d Sess., Part I, p. 1. Quoted also in *United States* v. *National Lead Co.*, 63 F. Supp. 513, 523, note 5.

divided the globe territorially. The American company was to have the North American continent. The Norwegian company was to have the rest of the world, except that reciprocal, nonexclusive rights of sale were reserved for both companies in South America.

Detailed provision was made for exchange of copies of applications for patents filed by the parties or their other licensees. Neither party was ever to question or contest the validity of any patent of the other under which it was licensed within the field described.

The American company became the exclusive agent for the Norwegian company in North America and vice versa outside of North and South America. Sales were to be at prices and on terms determined by the agent. Notwithstanding these agencies, however, importations of "finished articles"—that is, paint, paper, rubber, glass, etc.—containing titanium products of the principal, its licensees or sublicensees, would be permitted provided such products did not constitute such an important part of such finished articles that sales within the agent's territory would interfere substantially with the agent's sales of its own titanium products.

Each party would impart semiannually to the other information in detail as to knowledge obtained in and applicable to the "licensed field," and would permit the other to inspect and study operations in its plants (exclusive of research laboratories). The reciprocal grants of exclusive licenses would extend to December 31, 1936, and thereafter for periods of ten years each, with provision for termination by notice to be given at least five years before the end of any such period. In particular, so long as each company held an exclusive license from the other under this agreement, it would have the right to grant licenses under its own patents, and sublicenses under the other's patents, on the condition, nevertheless,

that every such licensee or sublicensee would grant to the party to the 1920 agreement (other than its licensor), its patent rights in the "licensed field" identical in character, territorial scope, and duration to those given by its licensor to such other party under the 1920 agreement, and would impart technical information to such other party in the same manner and to the same extent as its licensor.

In 1929, the obligations of Titan Co. A/S under this agreement were assumed by Titan Inc. and, in 1936, the obligations of The Titanium Pigment Company, Inc., were assumed by National Lead.

Other companies throughout the world joined in carrying out this program to restrain international commerce and to establish an international combination or conspiracy in restraint of trade. The complaint in the present case lists many of these foreign companies as co-conspirators with National Lead, Titan Inc. and du Pont, but it does not attempt to make such co-conspirators parties defendant. The District Court recognized that it did not have jurisdiction over such co-conspirators and found in that circumstance one of its difficulties in effectively restraining National Lead, Titan Inc. and du Pont from further violations of the Sherman Antitrust Act, pursuant to this international as well as domestic program. To accomplish this purpose, the District Court has adjudged these agreements to be unlawful and it has canceled them. In addition, it has enjoined all three defendants, National Lead, Titan Inc. and du Pont, from further performance of any of the provisions of such agreements and of any agreements amendatory thereof or supplemental thereto. Pars. 5 and 6 of the decree, 63 F. Supp. at 533–534.

National Lead acquired an 87% interest in Titan Co. A/S, Jebsen retaining 13%. The District Court found that "The intended purpose of the acquisition of control

of TAS by NL was to utilize TAS and the contract of 1920 to further control competition in the manufacture of titanium pigments and compounds in all markets of the world including the United States." Finding of Fact 47.[8] While this combination and conspiracy in restraint of interstate and foreign commerce thus was developing from 1920 to 1931, with National Lead and Titan Inc. at its center, du Pont was unconnected with it. Du Pont had initiated independent, but unsuccessful, efforts to develop, through research, a new and patentable commercially feasible process in this field. It became convinced that if it were to undertake the manufacture and sale of titanium pigments as a delevopment of its white pigment business, it would be necessary to enter the field as

[8] "This purpose was accomplished. The defendant NL and TAS agreed to have TAS and subsequently defendant Tinc form in each of the important industrial countries of the world, in association with a local corporation or firm which contemplated the manufacture and sale of titanium pigments and compounds or which could contribute to the technical or commercial development or which threatened to be a serious competitor of NL and TAS, a new company in which NL or TAS were to have a part interest. Any new company so formed was to be given certain territory in which it would have the exclusive right to manufacture and sell titanium pigments and compounds free from any exports into said territory by NL. The new company so organized was to refrain from competing with NL in its territory (the United States and other countries of North America) or in the territory of any other company associated with NL. TAS and subsequently defendant Tinc were to make said contracts providing for the formation of the new companies and NL was to be bound to adhere to all of the territorial restrictions placed on TAS and subsequently defendant Tinc in such contracts by virtue of contract Exhibit A. [The agreement of July 30, 1920.] All the present and future patents belonging to NL or TAS or any of the companies associated with either in the formation of such new companies, as well as those of the new companies to be organized, were to be licensed exclusively to NL for North America and to the new companies to be organized for their respective exclusive territories and to TAS and subsequently defendant Tinc for the rest of the world." Finding of Fact 48.

promptly as possible through the acquisition of the patents and of the going business of Commercial Pigments Company. That company had been formed by Commercial Solvents Corporation in 1928 and had acquired the Blumenfeld and other patents in the United States relating to the manufacture and sale of titanium pigments and compounds. It was operating a plant in Baltimore, Maryland, where it manufactured pure TiO_2 pigment only and sold it in competition with the The Titanium Pigment Company, Inc. (the affiliate of National Lead). In July, 1931, du Pont, through its subsidiary, Krebs Pigment & Color Corporation, acquired all of the assets and assumed some of the obligations of Commercial Pigments Company. It thus continued and, in fact, increased its competition in the titanium pigment field against National Lead. Findings of Fact 70, 12, 10 and 71.

> "Both NL and DP in good faith claimed that each infringed certain of the other's titanium pigment patents and both in good faith denied such infringement claiming, among other things, that the patents alleged to be infringed were of doubtful validity. NL and DP agreed in October, 1932, that the validity of the patents claimed to be infringed should not be questioned except as a last resort and that they should try to arrive at a general understanding." Finding of Fact 72.

Finally, in 1933, The Titanium Pigment Company, Inc. (by that time a 100% subsidiary of National Lead), and Krebs Pigment & Color Corporation (subsidiary of du Pont) were the only producers of titanium pigments in the United States. The 1920 agreement, however, prevented The Titanium Pigment Company, Inc. (National Lead), from entering into a contract with Krebs Pigment & Color Corporation (du Pont) unless the latter subscribed to the provisions of the 1920 agreement. Such a

subscription would have required an agreement by Krebs (du Pont) not to export into the territories of National Lead's foreign associates, and an agreement to grant to National Lead's foreign associates exclusive licenses under all of Krebs' (du Pont's) present and future patents for titanium pigments and compounds in the territories of the foreign associates. Finding of Fact 73. After extensive negotiations, National Lead and du Pont formulated an agreement in writing, dated as of January 1, 1933, which was executed August 28, 1933. It is summarized in Finding of Fact 73 and in the opinion of the lower court, 63 F. Supp. at 520–521. By its terms, it provided for cross-licensing but did not provide for the exclusive licensing and restrictive territorial and agency agreements specified in the 1920 program. Certain foreign associates of National Lead, particularly Interessengemeinschaft Farbenindustrie Aktiengesellschaft (usually referred to as I. G. Farbenindustrie), insisted upon some such commitment from du Pont or its subsidiary. This insistence never was abandoned. After further negotiations and an exchange of letters, all as set forth in full in Finding of Fact 73 and in the opinion of the District Court, 63 F. Supp. at 528–529, some understanding was reached as to the future conduct of du Pont, or of its subsidiary. On the strength of this, I. G. Farbenindustrie agreed to the situation. On the basis of all the evidence, the District Court found that—

> "DP, through Rupprecht [President of Krebs Pigment & Color Corporation] and Krebs [the corporation], by these assurances and Exhibit E [the agreement dated as of January 1, 1933], joined the conspiracy found herein to exist between NL and its foreign associates. DP's status rights and obligations were different from those of the other members of the combination. DP did not thereafter withdraw." Finding of Fact 73.

That finding, which we accept, throws important light upon the conditions to which the decree is to be applied. Furthermore, although National Lead and du Pont exchanged technical information relating to the manufacturing or use of titanium pigments or compounds from about April, 1932, until April, 1940, this exchange was discontinued May 1, 1940. The agreement of 1933 between The Titanium Pigment Company, Inc., and Krebs Pigment & Color Corporation which then had been assumed by National Lead and du Pont, respectively, was amended on January 1, 1941, to eliminate provisions for the exchange of technical information. Finding of Fact 75. It was further amended to include extender pigments, which theretofore had been included by implication and practice. Finding of Fact 76. After January 1, 1941, patent applications were to be available between National Lead and du Pont only after six months from the date of their filing, instead of immediately. Finding of Fact 77.

"From 1933 on there was active competition between NL and DP for customers. There has been a vast increase in sales; and repeated reductions in the price of titanium pigments have taken place and a very few increases. DP entered the titanium pigment business in 1931 and since that date it has made frequent plant expansions for the manufacture of pure and composite TiO_2 and its production increased from 20,027 tons in 1935 to 50,674 tons in 1941 and then decreased to 42,843 tons in 1943.

"NL and DP have endeavored to match each other's titanium products; but each also manufactures certain titanium pigments having special applications not manufactured by the other.

"There is no allocation of territory or customers between NL and DP; and each maintains a large, highly trained technical sales force engaged in en-

deavoring to sell titanium pigments. To a very large extent the salesmen of the two companies are chemists whose contact with consumers (that is, manufacturers of paint, rubber, glass, etc.) consists in endeavoring to demonstrate that their products merit acceptance on the basis of technical superiority. The buyers of titanium pigments are mainly well-informed, experienced purchasing agents. NL and DP sell for identical prices; there is no evidence that such price identity is the product of agreement or collusion." Finding of Fact 78.

These findings disclose the special conditions which confronted the District Court in framing its decree. They disclose a vigorous, comparatively young, but comparatively large, world-wide industry in which two great companies, National Lead and du Pont, now control approximately 90% of the domestic production in substantially equal shares. The balance of that production is in the hands of two smaller companies. Each of these is affiliated with larger organizations, not parties to this case. The findings show vigorous and apparently profitable competition on the part of each of the four producers, including an intimation that the smaller companies are gaining ground rather than losing it. Keen competition has existed both before and after the elimination, by the 1933 agreement and understanding, of certain patent advantages from among the weapons of competition. The competition between National Lead and du Pont has been carried into this Court where today National Lead supports the Government's proposal for royalty-free licenses, while du Pont argues strongly for a complete dismissal of the proceedings and contends that, in any event, if there are to be compulsory licenses they at least should require payment of uniform, reasonable royalties as provided in the present decree.

Assuming, as is justified, that violation of the Sherman Act in this case has consisted primarily of the misuse of

patent rights placing restraint upon interstate and foreign commerce, that conduct is not before this Court for punishment. It is brought before this Court in order to secure an order for its immediate discontinuance and for its future prevention. That will be accomplished largely through the strict prohibition of further performance of the provisions of the unlawful agreements. Further assurance against continued illegal restraints upon interstate and foreign commerce through misuse of these patent rights is provided through the compulsory granting to any applicant therefor of licenses at uniform, reasonable royalties under any or all patents defined in the decree. Such patents include not only the patents and patent applications listed in the appendix to the decree, but also, among others, all patents which cover any titanium pigments or any process for the manufacture of such pigments issued to, or acquired by, any of the appellant companies within five years from the date of the decree. It applies also to all such patents of which any of the appellant companies shall become the exclusive licensee within such five years with power to sublicense.

On the facts before us, neither the issuance of such licenses on a royalty-free basis nor the issuance of a permanent injunction prohibiting the patentees and licensees from enforcing those patents has been shown to be necessary in order to enforce effectively the Antitrust Act. We do not, in this case, face the issue of the constitutionality of such an order. That issue would arise only in a case where the order would be more necessary and appropriate to the enforcement of the Antitrust Act than here. In the absence of a showing to the contrary, it is obvious that some patents should entitle their owners to receive higher royalties than others. Also, it is clear that several patents, each of equal value, ordinarily should entitle their owners to a larger total return in

royalties than would one of them alone. It follows that to reduce all royalties automatically to a total of zero, regardless of their nature and regardless of their number, appears, on its face, to be inequitable without special proof to support such a conclusion. On the other hand, it may well be that uniform, reasonable royalties computed on some patents will be found to be but nominal in value. Such royalties might be set at zero or at a nominal rate. The conclusion, however, would depend on the facts of each case.

Recognizing the difficulty of computing a reasonable royalty,[7] nevertheless, that conception is one that already has been recognized both by Congress and by this Court.[8]

---

[7] *Hearings before Committee on Patents on H. R. 23,417*, 62d Cong., 2d Sess. (1912), Part XII, pp. 10–11; H. R. Rep. 1161, 62d Cong., 2d Sess. (1912), Part 2, p. 8; Report of Subcommittee of the American Bar Association appointed to consider the King Bill, S. 383, 74th Cong. (1935), p. 38.

[8] A recent recognition of a reasonable royalty test is contained in Chapter 726 of the 79th Congress, 2d Session:

". . . upon any judgment being rendered in any case for an infringement the complainant shall be entitled to recover general damages which shall be due compensation for making, using, or selling the invention, *not less than a reasonable royalty therefor*, together with such costs, and interest, as may be fixed by the court. . . ." (Italics supplied.) R. S. § 4921, as amended August 1, 1946, 60 Stat. 778, 35 U. S. C. A. § 70 (Supp. 1946), relating to the power of courts to grant injunctions and estimate damages.

The most recent and outstanding example of its recognition is in *Hartford-Empire Co. v. United States*, 323 U. S. 386, 413–417.

In patent accounting suits, where the profits or damages cannot be ascertained and no standard of comparison is available, the court may allow a reasonable royalty.

"But, as the patent had been kept a close monopoly, there was no established royalty. In that situation it was permissible to show the value by proving what would have been a reasonable royalty, considering the nature of the invention, its utility and advantages, and the extent of the use involved. Not improbably such proof was more difficult to produce, but it was quite as admissible as that of

The term frequently has been employed in Sherman Anti-trust case consent decrees.* In the present case, the royalties charged to and paid by Zirconium and Virginia Chemical provide enough guidance to indicate that the reasonableness of future royalties may be determined in this case with less difficulty than often might confront a court faced with such a task. Cf. *Sinclair Refining Co.* v. *Jenkins Petroleum Process Co.*, 289 U. S. 689, 697–698. The growing strength of those two royalty-paying licensees has demonstrated that royalty-free licenses have not been essential to such progress ever under past conditions. Finally, the District Court, under paragraphs 7 and 13 of the decree, will retain sufficient jurisdiction to enable it to vacate or modify its orders fixing reasonable royalty rates if it finds such action to be necessary or appropriate. We hold, therefore, that paragraphs 4 and 7 of the decree should not be modified either so as to provide for compulsory royalty-free licenses or so as to enjoin the patentees or licensees from enforcing the terms of the patents involved.

B. Request to add a provision requiring National Lead and du Pont each to submit, within a year, a plan for the divestiture by it of one of its two principal titanium

pigment plants, together with the related physical property. This request is urged by the Government in No. 89. It is strongly opposed both by National Lead and du Pont. The issue was discussed at length by the parties and the District Court in the reported conferences as to the form of the decree.

We believe there is neither precedent nor good reason for such a requirement. The violation of the Sherman Act is found in these cases in the patent pooling and in the related agreements restraining interstate and foreign commerce. There is neither allegation in the complaint nor finding of fact by the District Court that the physical properties of either National Lead or du Pont have been acquired or used in a manner violative of the Sherman Act, except as such acquisition or use may have been incidental or related to the agreements above mentioned. The cancellation of such agreements and the injunction against the performance of them by the appellant companies eliminate them. Paragraph 8 of the decree goes further. It requires National Lead and its subsidiary, Titan Inc., to present, within one year, a plan for divesting themselves of their stockholdings and other financial interests in certain foreign corporations, or for the purchase of the entire stockholdings and other financial interests, direct or indirect, in such corporations or any of them. Such a plan, which was required also to provide for its completion within two years from the date of the decree, will go as far toward divestiture as the findings of fact indicate should be necessary to make the decree effective.

There is no finding of fact, and apparently no evidence, showing that the respective principal titanium plants of National Lead or du Pont were acquired in violation of law, that they ever were separately owned or operated, or that they are adapted to such operation. Presumably, the requested divestiture would be for the purpose of providing four instead of two independent major competing

plants in the titanium pigment industry. However, there is no showing whether or not the two licensees, Zirconium (subsidiary of Glidden Company) and Virginia Chemical (subsidiary of American Cyanamid Company), may not be able to develop, under the decree, even more substantial competition against National Lead and du Pont than would new concerns operating the divested plants. No comparable precedents have been presented. Existing precedents of divestiture provide examples of the restoration of a pre-existing separate status to companies or properties which have been unlawfully combined rather than to the fission of units which never have been separated. *United States* v. *Crescent Amusement Co.*, 323 U. S. 173, 189; *Standard Oil Co.* v. *United States*, 221 U. S. 1, 77–82. Cf. *Northern Securities Co.* v. *United States*, 193 U. S. 197, 354–360.

There is no showing that four major competing units would be preferable to two, or, including Zirconium and Virginia Chemical, that six would be better than four. Likewise, there is no showing of the necessity for this divestiture of plants or of its practicality and fairness. The findings of fact have shown vigorous and effective competition between National Lead and du Pont in this field. The general manager of the pigments department of du Pont characterized the competition with Zirconium and Virginia Chemical as "tough" and that with National Lead as "plenty tough." Such competition suggests that the District Court would do well to remove unlawful handicaps from it but demonstrates no sufficient basis for weakening its force by divesting each of the two largest competitors of one of its principal plants. It is not for the courts to realign and redirect effective and lawful competition where it already exists and needs only to be released from restraints that violate the antitrust laws. To separate the operating units of going concerns without more supporting evidence than has been pre-

sented here to establish either the need for, or the feasibility of, such separation would amount to an abuse of discretion.

C. Request to add a provision requiring National Lead and du Pont to furnish to any applicant, at a reasonable charge, during a period of three years, technical information desired by the applicant relating to the methods and processes for manufacturing titanium pigments. This would supersede the provision now in the decree which, during a period of three years, makes available to a licensee certain information in writing, at a reasonable charge, as to the methods and processes used by his licensor at the date of the license. This is urged by the Government in No. 89 and opposed by National Lead and du Pont. Du Pont, in No. 91, goes further and urges the omission of all requirements compelling it to furnish technical information.

The request by du Pont to eliminate this requirement altogether is based, in part, upon the experience of the appellant companies. Du Pont emphasizes the fact that the titanium pigment industry has matured and that, since about May 1, 1940, the exchange of technical information between National Lead and du Pont has ceased. Also, the agreement between them which called for the exchange of technical information was amended January 1, 1941, to eliminate the provisions requiring such exchange. Finding of Fact 75. Du Pont argues that neither Zirconium, which entered the industry in 1934, nor Virginia Chemical, which entered the industry in 1935, ever exchanged technical information with du Pont or received any from du Pont. However, Finding of Fact 84 shows that, as to National Lead in 1935—

> ". . . NL and Zirconium cross licensed each other under all patents in the titanium pigment field, then owned or thereafter acquired, and both parties

agreed to exchange technical information and experience. . . .

"NL did render some engineering assistance to Zirconium in connection with the installation and use of its processes and imparted some technical information but frequently it refused to convey such technology to Zirconium on the ground that it was prevented by other agreements from so doing.

"On occasions before 1940 there was exchange of information between DP and NL relative to Zirconium's production."

Virginia Chemical was not licensed under National Lead's patents and apparently did not receive technical information from National Lead.

Finding of Fact 95, subparagraph 8, contains a further material finding, although this is disputed by du Pont:

"The defendants NL and DP secured a monopoly on technical information relating to the manufacture and use of titanium pigments and certain apparatus and equipment necessary to the manufacture of certain titanium pigments to the exclusion and detriment of other producers now engaged in the titanium pigment business in the United States; when NL and DP ceased exchanging technical information, the titanium pigment business was a mature industry."

The requirement for the exchange of technical knowledge under the present decree is merely that included in paragraph 7, which is as follows:

"During a period of three years from the date of this decree such license or reciprocal license may at the option of either party contain a provision for the imparting in writing at a reasonable charge, by the

licensor to the licensee, of the methods and processes used by the former at the date of the license in its commercial practice under the licensed patents in connection with the production of titanium pigments."

The limited scope of this access to technical information is apparent. On the other hand, there is reason to believe that the knowledge which thus can be secured may be vital in giving value to the compulsory licenses which are a central feature of the decree. The information is put upon a basis comparable to that of a license. Just as a licensee is required to pay a uniform, reasonable royalty for the privilege of operating under the patent, so, also, he is required to pay a reasonable charge for the information as to methods and processes which may be important to him in his commercial practice under the licensed patents.

The need for technical information to accompany patent licenses in this field, at least where desired by a newcomer, is testified to repeatedly. If there be such a need, the reasonableness of this limited availability of it as stated in the decree is hard to deny. Findings of fact evidencing the importance of such information include the following:

"NL wished to pool with DP all their patents and technical information relating to the manufacture or use of titanium pigments in the United States in order to settle its patent controversies with DP and to obtain access to DP's patents and technical facilities and jointly to control and dominate the manufacture and sale of titanium pigments and compounds; . . . . Both TP and Krebs began to exchange extensively technical information relating to the manufacture and use of titanium pigments in 1932 and the information so exchanged related to much more than any alleged claims of patent in-

fringement by either company. Blumenfeld and his foreign associates furnished technical aid and assistance to Krebs at its instance from August 1931 until the approximate date at which TP and Krebs commenced the exchange of technical information in 1932." Finding of Fact 72.

"DP and NL exchanged technical information relating in any manner to the manufacturing or use of titanium pigments or compounds from about April, 1932, until April, 1940." Finding of Fact 75.

"In entering into the agreement, Ex. E [the agreement of July 1, 1933], NL had several purposes:

1) For about a year prior to the making of Ex. E. officials of NL had been concerned by the early expiration dates of many of the patents upon which NL relied. By exchanging patents and technology with DP, a large and powerful corporation, possessed of great research facilities, NL expected to strengthen the patent monopoly of NL and DP jointly, as against newcomers in the titanium pigment business.

. . . . . .

"DP's purpose in entering into the agreement Ex. E were:

. . . . . .

3) To obtain access to NL's technical experience and patents in the titanium pigment field as well as the patents and the experience of NL's foreign associates.

. . . . . .

"The necessary effects of the agreement Ex. E and of DP assurances have been

1) The achievement of NL purposes.

2) The achievement of DP's purposes.

3) To give NL and DP together domination and control over the titanium pigment business in the U. S." Finding of Fact 79.

National Lead on this point now takes a middle ground. Apparently it supports the present provision in the decree and opposes its expansion as proposed by the Government. It expressly endorses the present provisions if the decree is amended so as to put the compulsory licenses on a royalty-free basis. If it approves this grant of access to technical information on that basis, it hardly can object to it in connection with licenses on a uniform, reasonable royalty basis.

The fact that this Court eliminated, without discussion, paragraph 24 (c) from the *Hartford-Empire* decree is not controlling here. *Hartford-Empire Co. v. United States, supra*, 413, 418. The fact that the violations of the Anti-trust Act may have been more reprehensible in that case than here is not persuasive because this provision is not and should not be punitive. The justification for the compulsory imparting of methods and processes rests upon its appropriateness and upon the necessity for it in providing an effective decree. In the *Hartford-Empire* decree, paragraph 24 (c) proposed to make available to any licensee under paragraph 24 (a) (without royalties), or under paragraph 24 (b) (with reasonable royalties), at cost, plus a reasonable profit, "all drawings and patterns 'relating to the machinery or methods used in the manufacture of glassware' embodied in the licensed inventions . . . ." *Id.* at 413–414. This Court, in that case, modified paragraphs 24 (a) and 24 (b) and deleted paragraph 24 (c). In the absence of a statement of this Court's reasons for the deletion of paragraph 24 (c), it cannot be assumed that, by such deletion, it announced its disapproval, in all future decrees, of provisions requiring the supplying of technical information to licensees at a reasonable charge.

It may well be that the District Court, in the present case, took into consideration the argument made by National Lead that, in this field, "The product claims cover practically all such improved titanium pigments." Thus,

of 23 different grades of titanium pigments (*i. e.* different products) sold by NL. 21 are covered by unexpired patents." Finding of Fact 37. Therefore, the imparting to the newcomer of methods and processes covered by the decree might be particularly important to him in entering this industry where substantially all the commercial products are covered either by process or product patents.

Du Pont has presented a strong case against compelling it to make further disclosure of its technical information to its leading competitor, National Lead, in this comparatively mature technical industry, especially since the agreement of 1941 between these companies expressly terminated their pre-existing agreement to supply such information. This argument does not apply, however, with comparable force, to the many other situations toward which this provision is directed. Under all the circumstances, and in view of the narrow limits written into the provision by the District Court, we believe that it represents a permissible exercise of judicial discretion. It is to be judged from the point of view of the public interest as well as that of the private interests concerned. That public interest requires that the court be permitted to produce the most effective and generally fair decree that it can devise to give effect simultaneously to the antitrust laws and the patent laws.

This decision relies also on the permissible breadth of the District Court's discretion over the conditions under which technical information shall be required to be shared with the world. The attempt of the Government to throw the field of technical knowledge in the titanium pigment industry wide-open would reduce the competitive value of the independent research of the parties. It would discourage rather than encourage competitive research. It would be contrary to, rather than in conformity with, the policy of the patent laws now in force.

Changes in the underlying policies of the patent laws frequently have been presented to Congress,[10] but Congress, by its failure to accept those changes, has added to, rather than detracted from, the strength of the present and traditional patent policies.

"D. Request to omit the provision that National Lead and du Pont, respectively, may make the grant of any license by either of them to an applicant under the decree, conditioned upon the reciprocal grant of a license by the applicant at a reasonable royalty, under certain described patents owned or controlled by such applicant. This is urged by the Government in No. 89 and opposed by the appellant companies.

The District Court, during the conferences on the terms of the decree, summarized the need for this provision by a concrete illustration of what it suggested might happen without it. It said:

> "Otherwise you will arrive at a situation conceivably where Virginia Chemical would simply change places with du Pont in becoming the dominating factor in the industry under this extraordinary advantage of being able to take everything for itself and keeping everything that it has."

The District Court distinguished the present case from the *Hartford-Empire* case by showing that, in the latter, there had not been a similar reason for inserting the reciprocal requirement. In that case, the court was dealing with a licensor organization which had no use for patents except for the resulting control over licensing and, consequently, it would have derived no benefit from cross-

[10] H. R. 20488, 60th Cong., 1st Sess. (1908); H. R. 11,796, 61st Cong., 1st Sess. (1909); H. R. 2030, 62d Cong., 1st Sess. (1911); H. R. 16828, 62d Cong., 2d Sess. (1912); H. R. 23,417, as amended, 62d Cong., 2d Sess. (1912); H. R. 1700, 63d Cong., 1st Sess. (1913); H. R. 14,865, 63d Cong., 2d Sess. (1914); S. 2783, 70th Cong., 1st Sess. (1928); S. 2491, 77th Cong., 2d Sess. (1942).

licenses. The reciprocal clause includes an appropriate reference to future patents. As a five-year limit is put on the patents which will be subject to the compulsory license clause, under paragraphs 4 and 7 of the decree, so also the reciprocal licenses are limited by paragraph 7 to "patents covering titanium pigments or their manufacture, now issued or pending or issued within five years from the date of this decree. . . ."

Here again, the provision is well within the discretion of the District Court in seeking means to fit the relief it grants to the needs of the particular case, always with due regard to the underlying public interest that is inherent in the antitrust and patent laws.[11]

E. Request to omit the six-months' time limit imposed by the decree upon the options of American Zirconium Corporation and Virginia Chemical Corporation, respectively, to secure certain licenses under the decree. This is urged by the Government in No. 89. It is not discussed here in the briefs of the other parties. The effective date of the decree of October 11, 1945, was stayed and suspended, by the order of MR. JUSTICE REED entered January 2, 1946, pending determination of the present appeals to this Court, so that more than six months already have passed since the original date of the decree without prejudicing the rights of the parties affected. In view of such suspension and of the new effective date to be given to the decree, pursuant to the order of this Court, there will be ample time for the exercise of this option under its terms.

F. Request to modify the language of the decree so as to eliminate language which, it is claimed, enjoins normal

[11] Provisions for reciprocal licensing have been incorporated in consent decrees. See *United States* v. *General Elec. Co.*, CCH Trade Reg. Serv. ¶ 52,777 (D. C. N. J. 1942); *United States* v. *American Bosch Corp.*, CCH Trade Reg. Serv. ¶ 52,888 (D. C. S. D. N. Y. 1942).

and usual business arrangements betwen the appellant companies and other producers of titanium products. This is urged by National Lead in No. 90 and is opposed by the Government. The precise request is to strike from paragraphs 5 and 6 of the decree certain language shown in the margin of this text in italics and to insert in paragraph 6 the word "producer" at the point there shown in capital letters.[12] National Lead contends that the cancellation of the agreements, as ordered in paragraph 5, and the injunction, as ordered in paragraphs 5 and 6, against

[12] "'5. The following agreements are hereby adjudged to be unlawful under Section 1 of the Sherman Act and each of them is hereby cancelled *and the defendants and each of them and all persons acting or claiming to act through, for or under them and all successors and subsidiaries of any of the defendants are hereby enjoined and restrained from the further performance of any of the provisions of said agreements and of any agreements amendatory thereof or supplemental thereto:* [followed by a list of the canceled agreements]

"'6. Each of the defendants and each of their directors, officers, agents, employees, successors and subsidiaries and all persons acting, or claiming to act under, through or for them or any of them are hereby enjoined and restrained (a) *from entering into, adhering to, maintaining or furthering, directly or indirectly, or claiming any rights under any contract, agreement, understanding, plan or program among themselves, the co-conspirators, or with any other person, partnership or corporation, which has as its purpose or effect the continuing or renewing of any of the agreements listed in paragraph 5 hereof;* (b) from entering into, adhering to, maintaining or furthering, directly or indirectly, any contract, agreement, undertaking, plan or program with any other producer or dealer relating to titanium pigments which has as its purpose or effect (1) to divide sales or manufacturing territories, (2) to allocate markets, (3) to limit or prevent United States imports or exports, (4) to grant to any third party any market as its exclusive territory, (5) to keep any third party out of any market; provided, however, that nothing contained in this subdivision (b) of this paragraph 6 shall prohibit any normal and usual arrangements between any defendant and its directors, officers, employees, agents, subsidiaries, or any PRODUCER, dealer or distributor, whether or not a co-conspirator; (c) from restricting any purchaser of titanium pigments in the use thereof.'"

the further performance or the continuation or renewal of the unlawful provisions thereof (namely, division of sales or manufacturing territory, allocation of markets, limitation of imports or exports, restrictions on use, etc.) will insure complete and effective relief without subjecting National Lead or du Pont to undue hardship and losses. Accordingly, National Lead states that it asks for the changes here indicated in the interest of promoting trade and competition in titanium pigments.

We agree, however, with the Government's interpretation that paragraph 5 deals solely with the future enforceability of existing contracts and that the deletion of the words requested by National Lead is not necessary in order to remove barriers to future contracts. Paragraph 6 deals with future contracts. Clause (a) enjoins the parties from entering into or adhering to any agreement, plan or program "which has as its purpose or effect the continuing or renewing of any of the agreements listed in paragraph 5 . . . . ." Since such agreements have been found to violate the Sherman Act, this provision imposes no unjustified restriction on National Lead's power to contract. We find also no sufficient basis for inserting the word "producer" as requested in paragraph 6. If National Lead later can demonstrate that its right of contract has been unduly restricted, it may, under the terms of the decree, apply to the District Court for a modification of the judgment.

G. Request to omit the requirement that National Lead and Titan Inc., within one year, shall present to the District Court, for its approval, a plan for divesting themselves of their stockholdings and other financial interests in certain foreign companies or for the purchase of the entire stockholdings and interests, direct or indirect, in such companies or any of them. To accomplish this, National Lead and Titan Inc., in No. 90, urge the deletion

of paragraph 8 from the decree.[13] The Government opposes such deletion. The requirement imposed by paragraph 8 is merely that certain parties shall present to the District Court, within one year, a plan subject to its approval. That court, during the conferences on the terms of the decree, said: "In other words, the stock acquisitions were part and parcel of the territorial allocation agreements, and probably were a necessary element in the establishment of the territorial arrangement." We find ample reasons in the record for the action of the District Court in inserting paragraph 8 in the decree. It is related directly to the injunction against further performance of any of the provisions of the agreements listed in the decree as being in violation of the Sherman Act.

In thus disposing of the points relied upon in the respective appeals, the decree will remain as originally entered by the District Court, excepting only that, as a result of the dissolution of the stay and suspension of certain provisions of the decree contained in paragraphs 5, 8, 9, 10 and 11 thereof, which were granted pending determination of these appeals to this Court, the decree shall be deemed, for the purposes of those paragraphs and for the running of time thereunder, to take effect on the effective date of the mandate to be issued by this Court.

For the reasons set forth, the motion of the United States to amend its assignments of error is granted and the judgment of the District Court is

Affirmed.

MR. JUSTICE BLACK and MR. JUSTICE JACKSON took no part in the consideration or decision of these cases.

---

[13] For paragraph 8, *see* note 4, *supra*.

SUPREME COURT OF THE UNITED STATES

Nos. 89, 90, 91.—October Term, 1946.

The United States of America, Appellant, 89 v. National Lead Company, Titan Company, Inc., and E. I. du Pont de Nemours and Company.	On Appeals from the District Court of the United States for the Southern District of New York.
National Lead Company, and Titan Company, Inc., Appellants, 90 v. The United States of America.	
E. I. du Pont de Nemours and Company, Appellant, 91 v. The United States of America.	

[June 23, 1947.]

Mr. Justice Douglas, with whom Mr. Justice Murphy and Mr. Justice Rutledge concur, dissenting in part.

I cannot agree that royalties should be charged on patents whose misuse has been so flagrant as to persuade us to approve compulsory licensing of all who desire to use the inventions. Nor do I think that the failure to provide for royalty free licensing may be sustained as an exercise of the judicial discretion of the District Court. That would be the case if the District Court had been free to frame its decree unembarrassed by the ruling in *Hartford-Empire Co.* v. *United States*, 323 U. S. 386, 324 U. S. 570. In that case this Court modified an anti-trust decree so as to permit "reasonable" royalties on patents which had been ordered licensed without charge to all applicants. The language there used well might

lead a court to the conclusion that royalty-free licensing is a remedy unacceptable as a matter of law.[1] In these circumstances it is fair to assume that the action of the district judge in the present case was in deference to the *Hartford-Empire* rule rather than a reflection of his own judgment.[2]

The *Hartford-Empire* case presented the first instance, so far as I am aware, of the incorporation of a royalty free licensing provision in an antitrust decree. Since the question is one of the greatest importance in the administration of the antitrust laws, and was not considered by the full Court,[3] I think it remains an open one, except as applied to the *Hartford-Empire* case, and we are free to consider whether that case should be followed under the facts and circumstances here presented.

In the *Hartford-Empire* case the Court stressed the fact that Congress had not specifically authorized for-

---

[1] "That a patent is property, protected against appropriation both by individuals and by government, has long been settled. In recognition of this quality of a patent the courts, in enjoining violations of the Sherman Act arising from the use of patent licenses, agreements, and leases, have abstained from action which amounted to a forfeiture of the patents.

"The Government urges that such forfeiture is justified by our recent decisions. . . . But those cases merely apply the doctrine that, so long as the patent owner is using his patent in violation of the antitrust laws, he cannot restrain infringement of it by others. We were not there concerned with the problem whether, when a violation of the antitrust laws was to be restrained and discontinued, the court could, as part of the relief, forfeit the patents of those who had been guilty of the violation. Lower federal courts have rightly refused to extend the doctrine of those cases to antitrust decrees by inserting forfeiture provisions." 323 U. S. pp. 415–416.

[2] He, indeed, stated on argument of a motion to determine reasonable royalties: "I would have liked to go along on the question of royalty-free patents, but I felt that I hadn't been given the green light on that."

[3] The *Hartford-Empire* decision was four to two on this point.

feiture of patents in antitrust actions. It thought that "if, as we must assume on this record, a defendant owns valid patents, it is difficult to say that, however much in the past such defendant has abused the rights thereby conferred, it must now dedicate them to the public." 323 U. S. p. 415. The difficulty with that argument is that it proves too much. For the Court was at the same time sanctioning compulsory licensing, a most serious inroad on patent rights. The patent law gives to the patentee or his assignee the "exclusive right to make, use, and vend the invention or discovery. . . ." R. S. § 4884, 35 U. S. C. § 40. If the antitrust court could not interfere with patent rights, then it could not order licensing on any terms, for mandatory licensing is hardly consistent with exclusive rights. Again, if the failure of Congress specifically so to provide prevents a court from directing royalty-free licensing, then by the same token the failure to provide for compulsory licensing is a bar to that relief also.

It is thus clear that the criterion for choosing the appropriate antitrust remedies cannot be found in Congressional silence. The task of putting an end to monopolistic practices and restoring competition is one of magnitude and complexity; Congress has authorized use of the broadest powers of equity to cope with it. Under a statute providing more detailed remedies than do the antitrust laws, we have held that an equity court may mould additional ones. *See Porter* v. *Warner Holding Co.*, 328 U. S. 395. And its powers under the antitrust laws, though not specifically enumerated, are ample to thwart the plans of those who would build illegal empires, no matter how imaginative their undertakings or subtle their techniques. The power of the court is not limited to the restraint of future transgressions. The impairment of property rights is no barrier to the fashioning of a decree which will grant effective relief. *United States*

v. *Union Pacific R. Co.*, 226 U. S. 470, 476–477. Divestiture or dissolution may be ordered in spite of hardship, inconvenience, or loss. *United States* v. *Crescent Amusement Co.*, 323 U. S. 173, 189. Devices or instrumentalities which may be used for legitimate ends may nevertheless be outlawed entirely where they have been employed to build the monopoly or to create the restraint of trade. *United States* v. *Crescent Amusement Co.*, *supra*, pp. 187–188. For the aim of the decree is not only to prevent a repetition of the unlawful practice but to undo what was done, to neutralize power unlawfully acquired, to prevent the defendants from acquiring any of the fruits of the condemned project. *Standard Oil Co.* v. *United States*, 221 U. S. 1, 78.

If that is to be done here, I think we must do more than forbid further expansion of the existing monopolistic situation. The defendants have unlawfully acquired control and domination over this industry to the exclusion of competitors. This control was obtained in part through the unlawful acquisition and use of patents. As stated by the District Court, "These patents, through the agreements in which they are enmeshed and the manner in which they have been used, have, in fact, been forged into instruments of domination of an entire industry. The net effect is that a business, originally founded upon patents which have long since expired, is today less accessible to free enterprise than when it was first launched." 63 F. Supp. 513, 532. If defendants are allowed royalties on those patents, they do, indeed, reap dividends from their unlawful activities. As stated in a dissent in the *Hartford-Empire* case, "Every dollar hereafter, as well as heretofore, secured from licenses on the patents illegally aggregated in the combination's hands is money to which the participants are not entitled by virtue of the patent laws or others. It is the immediate product of the conspiracy." 323 U. S. p. 443.

But beyond that is the effect on the industry. Here defendants have been in a commanding and impregnable position. They have dominated the field and suppressed competition. If competition is to be restored strong measures must be adopted to provide the maximum opportunity for new ventures to compete with the established giants of the industry. It is here that the major vice of permitting royalties on the licensed patents becomes apparent. Each dollar of royalty adds a dollar to the costs of the new competitor and gives the established licensor another dollar with which to fight that competition. As stated by National Lead in its brief before this Court:

> "National and du Pont not only compete with their licensees but dominate the titanium industry. A requirement of uniform, reasonable royalties in no way frees competition because, no matter what the royalty may be, *in this industry* a licensee required to pay more than its licensor will be at a competitive disadvantage."
>
> . . . . . .
>
> "Compulsory licensing alone would not be enough to restore the industry to a healthy, competitive condition. If National and du Pont are permitted to receive royalties on their existing patents, they will still be in position to dominate the industry."

If National Lead, the world's largest producer of titanium pigments, expects to find itself at a competitive disadvantage as a result of reasonable royalty licenses, what can be the probable fate of newcomers or existing independents of smaller stature?[4]

[4] It must be remembered that one of the consequences of the unhealthy monopolistic condition in the industry has been a dearth of the ordinary patent litigation. The burden of testing potentially invalid patents will thus be placed on the first enterprise unwilling to pay the royalties.

The decree approved by the Court stops short of granting effective relief. Divestiture is refused. Compulsory licensing is ordered, but only to those who are willing reciprocally to license use by the defendants of their patents. In this additional respect the decree will enable the large established companies to strengthen their dominant position. To get the benefits of the decree an independent must give up one of his few competitive advantages—the exclusive right to use such patents as he may possess. These provisions, plus the additional requirement of royalties on the misused patents, even though those royalties be "reasonable," greatly increase the odds against restoration of competition in this industry.

Except as to the matters mentioned, I join in the opinion of the Court.
